That was followed by a March memo on project emissions accounting, also known as project netting, which tells facilities how to calculate whether emissions from their proposed new construction projects would increase pollution. Under the new guidance, facilities can include emissions decreases from their projects to the overall calculations to avoid triggering new source review.

The memo drew inspiration from a 2006 rule changing three aspects of emissions counting under new source review, which lost traction after Wehrum left the agency.

"Finalizing this [2006] rulemaking would help to remove a substantial burden to energy and

AMERICAN OVERSIGHT

manufacturing projects," Louis Renjel, vice president of federal government affairs and strategic policy at Duke Energy, wrote in response to an EPA call for suggestions on reducing regulatory burdens.

The American Chemistry Council also asked the EPA to revisit the reforms proposed during the Bush-era EPA, whether through guidance, regulation, or legislation.

The EPA this summer aims to address project aggregation, another piece of new source review reform from Wehrum's 2006 rulemaking bundle.

It would define how emissions from separate modifications that take place around the same time should be counted, according to a presentation Anna Marie Wood, director of the EPA's Air Quality Policy Division, gave at a state air regulators conference April 5.

More Guidance Coming

Three more guidance memos are slated to be issued this spring, according to Wood's presentation.

One would redefine what counts as "ambient air," or the air the general public breathes. This definition is important to new source review because facilities must show that their post-construction emissions won't worsen air quality according to the national standards, Lynn Hutchinson, the EPA new source review project lead in 2002, told Bloomberg Environment.

Another guidance document in the works would change the pollutant modeling used to decide whether emissions would damage air quality. The White House completed its review of the memo April 12.

A third spring guidance document would allow the EPA to revive an attempt to expand the kinds of routine maintenance and repairs excluded from new source review. That 2003 rule was vacated by the U.S. Court of Appeals for the District of Columbia Circuit in New York v. EPA in 2006, which said industries could not write off physical changes that cost below a certain amount as routine maintenance.

"You already have a court on record saying those particular reforms are not allowed, so those might be a heavier lift without notice and comment rulemaking," Alonso said.

When asked how he will ensure that his current batch of reforms stick beyond the current administration, Wehrum said, "a piece of it is making change that will last, but the bigger piece of it, for me, again, is just from a public policy standpoint."

"If people can't look at our rules and know what they need to do to comply, then we've got a problem," he said.

Fox's Hannity Revealed as Mystery Client of Trump's Personal Lawyer

By Brendan Pierson, Karen Freifeld, Jonathan Stempel, 4/16/18

U.S. President Donald Trump's personal lawyer was forced on Monday to reveal in a New York federal court that Fox News personality Sean Hannity, one of Trump's most ardent defenders, was also on his client list.

Michael Cohen, Trump's fiercely loyal and pugnacious lawyer, disclosed Hannity's name through one of his own lawyers at the order of the judge. Stormy Daniels, an adult-film actress who says she had a sexual encounter with Trump, watched from the public gallery.

Daniels, in a separate civil case, is fighting a 2016 non-disclosure agreement arranged by Cohen in which she got $130,000 to stop her from discussing her claim she had sex with Trump a decade earlier, something Trump has denied.

Hannity, 56, said on Monday that he had never paid for Cohen's services or been represented by him, but had sought confidential legal advice from him. The conservative host often uses his weeknight broadcast on Fox News to defend the president against what he sees as biased attacks by the media. Sometimes Trump praises Hannity in return.

Cohen was in court to ask the judge to limit the ability of federal prosecutors to review documents seized from his offices and home last week as part of a criminal investigation, which stems in part from a probe into possible collusion between Trump's presidential campaign and Russia. (Full Story)

The Russia investigation has frustrated the White House as it has spread to enfold some of Trump's closest confidantes.

Judge Kimba Wood spent more than 2-1/2 hours listening to arguments by Cohen's lawyers, prosecutors from the U.S. attorney's office in Manhattan and a lawyer representing Trump in the hearing. She is expected to rule later.

She ordered prosecutors to give Cohen's lawyers a copy of the seized materials before the next hearing.

The unexpected naming of Hannity made him the latest prominent media personality to be drawn into the investigation's cast of unlikely supporting characters.

AMERICAN OVERSIGHT

Daniels, whose real name is Stephanie Clifford, was another. As she arrived at the courthouse dressed in a lavender suit, photographers knocked over barricades as they scrambled to get pictures.

Daniels sat with her lawyer, Michael Avenatti, who told reporters they were there to help ensure protection for the integrity of the seized documents, some of which they believe pertain to the Daniels agreement.

Cohen, dressed in a dark suit, at times looked tense, folding and clasping his hands in front of him.

GASPS AND LAUGHTER

Cohen has argued that some of the documents and data seized from him under a warrant are protected by attorney-client privilege or otherwise unconnected to the investigation. But Judge Wood said she would still need the names of those other clients, and rejected his efforts to mask the identity of Hannity, a client Cohen had said wanted to avoid publicity.

"I understand if he doesn't want his name out there, but that's not enough under the law," Wood said, before ordering the name disclosed.

Stephen Ryan, a lawyer for Cohen, drew gasps and laughter from the public gallery when he named Hannity as the client.

After his identity was revealed, Hannity said on his syndicated radio show, and again later on his Fox News program, that he had "occasional, brief discussions" with Cohen in which he sought out Cohen's "input and perspective."

Hannity said he assumed those discussions were covered by attorney-client privilege, and insisted that none involved any matter between himself and a third party. He also said his talks with Cohen "almost exclusively focused on real estate."'

Legal advice can be considered privileged even if given by a lawyer for free.

Hannity, the top-rated personality on the most watched U.S. cable news network, told his viewers on April 9 that the raid on Cohen was part an effort by federal investigators to wrongly impeach the president. He never mentioned his association with Cohen during that broadcast.

On Monday's show, Hannity expressed amusement at the firestorm of media coverage unleashed by the disclosure that he and Trump shared a legal adviser in Cohen, playing a 45-second, rapid-fire montage of various TV commentators and anchors uttering his name on the air throughout the day.

Cohen has asked the court to give his own lawyers the first look at the seized materials so they can identify documents that are protected by attorney-client privilege. (Full Story)

AMERICAN OVERSIGHT

Failing that, they want the court to appoint an independent official known as a special master, a role typically filled by a lawyer, to go through the records and decide what prosecutors can see.

But prosecutors want the documents to be reviewed for attorney-client privilege by a "taint team" of lawyers within their own office, who would be walled off from the main prosecution team.

"I have faith in the Southern District U.S. Attorney's Office that their integrity is unimpeachable," making a taint team "a viable option," Judge Wood said.

But she also said that to help ensure fairness and the perception of fairness, "a special master might have some role here."

After the hearing, Cohen left without comment.

Daniels, in contrast, stepped up to the bank of microphones set up on the sidewalk, telling reporters that Cohen had thought he was above the law.

"My attorney and I are committed that everyone finds out the truth and the facts of what happened, and I will not rest until that happens," she said.

Washington Free Beacon

Ex-CIA Chief Says Obama Rejected Cyber Action Against Russia for Election Meddling

By Bill Gertz, 4/17/18

Despite an unprecedented Russian intelligence operation to influence the 2016 presidential election, former President Barack Obama rejected a plan to conduct retaliatory cyber action against Moscow during the campaign, according to former CIA Director John Brennan.

Brennan disclosed Saturday that Obama opposed a plan to carry out "a cyber event" against the Russians because the former president feared the action would lead to more aggressive interference by Moscow.

"There was consideration about rattling their cages with some type of cyber event," Brennan said during remarks to a journalism conference at the University of California Berkeley.

But based on Obama's fears, the planned cyber action was shelved in favor issuing vague

AMERICAN OVERSIGHT

warnings to Russian officials. Brennan did not elaborate on the cyber retaliation plan.

"President Obama was the ultimate decision-maker on that," Brennan said of the lack of response.

The former CIA director defended the Obama administration's handling of what is widely viewed as a significant counterintelligence failure during the presidential election.

After the election, Obama ordered the expulsion of 35 Russian intelligence officers.

Both the FBI and CIA are charged with the conducting counterintelligence–detecting and thwarting hostile intelligence operations. Both agencies failed to halt the Russians in 2016 either in the United States or abroad.

U.S. officials have said the targeting of U.S. and foreign elections by Russia is continuing.

President Trump in February criticized his predecessor in a Tweet for failing to act. "Why didn't Obama do something about the meddling? Why aren't Dem crimes under investigation? Ask Jeff Sessions!" he tweeted.

The disclosure that Obama scrapped a cyber plan to retaliate against Moscow for election interference comes as a former senior counterintelligence official, Michelle Van Cleave, revealed in congressional testimony last week that the Obama administration weakened American counterintelligence programs by downgrading a top counterspy office.

Brennan said he had "great confidence" the Russian influence operation was authorized and directed by Russian President Vladimir Putin, a former KGB intelligence officer. The Russian intelligence services also "know what the mission is, know what their capabilities are, and will apply them to issues that are of interest to Russian national security," he said.

Brennan called the meddling "unprecedented in terms of its scope and intensity, and made full use of the digital domain."

The first indications of Russian interference were spotted in late 2015 and early 2016 and the operation was mentioned in press reports in the spring of 2016. By the summer of 2016 the operations were confirmed, he said.

Obama also made clear to the CIA that he did not want the agency doing anything "in reality or in perception" that would have advanced the Russian disinformation and propaganda campaign, Brennan said.

"We were really trying to strike the right balance between doing everything we could to prevent and thwart as well as to uncover and understand what the Russians were doing without doing anything that would almost advance their interests in trying to disrupt our election," he said.

Obama also was afraid any U.S. action against the Russians might be perceived as an outgoing

AMERICAN OVERSIGHT

Democratic president working to influence the election outcome.

"So if we did more things and stood at the hilltops and cried out, 'the Russians, the Russians are trying to help Trump get elected,' and if President Obama who is the titular head of the Democratic Party were to do that, I think that there would have been a lot of people would believe, I think with some justification, that the President of the United States was trying to influence the outcome of a presidential election," Brennan said.

Brennan also said the Obama administration opposed aggressive action because of the president's belief that any effort to punish the Russian might produce stepped up activities.

Russian hackers had been detected navigating inside state election voter registration roll computers and other election-related networks.

"They had things that they could have done that they didn't do," Brennan said of the Russians.

Intelligence agencies concluded in a report issued in early 2017 that Russian civilian and military intelligence agencies conducted an aggressive operation to sow social discord during the 2016 election by opposing Hillary Clinton while seeking to boost Donald Trump's campaign.

The Russian operation included the use of advertising on social media platforms like Facebook, and cyber attacks involving the cyber theft of emails and postings online using covert internet personas.

In February, 13 Russians were indicted by Special Counsel Robert Mueller for running a St. Petersburg, Russia-based internet troll farm that carried out influence operations during the elections.

So far, no action has been taken against the Russian hackers engaged in email thefts.

Kenneth deGraffenreid, former deputy national counterintelligence executive, said Obama's inaction was a major counterintelligence failure.

"If Brennan's claims are true, the Obama administration's inaction in the face of this Russian cyber aggression represents a serious counterintelligence failure that has had terrible consequences," deGraffenreid said.

"Good counterintelligence requires an active element beyond collecting and analyzing the secret information that has been uncovered–namely countering this serious foreign intelligence threat in an effective way. The U.S. has the sophisticated tools to do this."

"There simply is no excuse for not doing so," he added. "Our national security depends on American leaders taking the action required."

Despite signs the operation had been underway since 2015, Brennan said he was the first U.S. official to protest the matter during an Aug. 4, 2016, telephone to Alexander Bortnikov, head of

AMERICAN OVERSIGHT

Russia's FSB security service.

"I told him rather directly that if the Russians were to go down this road, they would pay a significant price," Brennan said. "I told him that all Americans would be outraged by a Russian effort to try and interfere in our election."

A month later at the G-20 summit in China, Obama confronted Putin about the election interference, according to Brennan.

Weeks later, Director of National Intelligence James Clapper and Homeland Security Secretary Jeh Johnson issued an official statement accusing the Russian government of interfering with the election campaign.

Brennan said he believes the softline Obama policy dissuaded Moscow from intensifying the campaign and that he had no regrets.

Additionally, the former CIA chief said he has spoken to Obama who he asserted is "very comfortable with what we did and didn't do."

"I would argue that I think by pushing them back a bit and confronting them with it, both privately as well as publicly, I think we did dissuade them from even going further," he said.

Brennan also said the CIA was told by Obama not to take any action on the Russian intelligence operation over concerns any action would appear the administration was trying to support the Democratic candidate, Hillary Clinton.

Since leaving office, Brennan has been a Trump critic, taking to Twitter to call the president a "charlatan," "demagogue," and "snake oil salesman."

Brennan said that criticism has cost him financially as "a number of opportunities were rescinded."

Russian cyber intelligence operations are sophisticated and difficult to track, he said.

"And so I fully anticipate that the Russians and others are going to take advantages that are there," Brennan said. "They are going to try to hide their footprints better. They're going to try to prevent the U.S. from understanding what may be happening there. But let's not make a mistake, that environment is ripe for mal actors and they are going to continue to cause us problems."

On the controversial dossier produced by former British intelligence officer Christopher Steele, Brennan said the dossier may have been part of a Russian cover operation.

"Well certainly it could be," he said. "I don't know the provenance of the information. As I said I've seen the dossier. It is done by a former accomplished member of the British intelligence service, MI-6. It is sourced to unnamed sources and subsources that alleged these types of activities. So I don't know whether the information in it–some, all or none–is valid or not."

AMERICAN OVERSIGHT

Brennan said he does not believe Steele was manipulated by the Russians for intelligence purposes.

"I do not believe he is acting on behalf of them," he said. "Might he have been unwittingly used? Maybe. So I don't know."

The Steele dossier was funded by the Democratic National Committee and the Clinton campaign through the research group Fusion GPS.

The Washington Free Beacon hired Fusion GPS to conduct research on Republican candidates but had no role in the dossier.

On his political views, Brennan said he is not a member of any political party and described himself as "an avowed nonpartisan."

In 2016, Brennan disclosed that in 1976 he voted for the Moscow-backed Communist Party USA candidate for president, Gus Hall, during the height of the Cold War.

Comey on Trump Calling for Him to Be Jailed: 'This Is Not OK'

By Louis Nelson, 4/17/18

Former FBI Director James Comey denounced Donald Trump's presidency as a threat to bedrock American values, warning that the president's calls for Comey to be jailed could erode the rule of law.

The former FBI director, whom Trump fired last spring, has been a frequent target of Trump's criticism, especially in recent days amid the start of a publicity tour for Comey's book, which was released Tuesday. Comey has been deeply critical of the president, characterizing him as morally unfit to occupy his office, while Trump has labeled the former FBI director as a liar and leaker, suggesting he be sent to jail.

"President Trump, I don't follow him on Twitter but I get to see his tweets tweeted, I don't know how many, but some tweets this past couple of days that I should be in jail. The president of the United States just said that a private citizen should be jailed. And I think the reaction of most of us was, 'meh, that's another one of those things.' This is not normal. This is not OK," Comey told NPR in an interview broadcast Tuesday morning. "The reason I'm talking in terms of

AMERICAN OVERSIGHT

morality is, those are the things that matter most to this country. And there's a great danger we'll be numbed into forgetting that, and then only a fool would be consoled by some policy victory."

While Comey's criticism of the president, both in interviews and in his book, has been withering, so too has the White House's response. Trump administration officials have painted Comey as a disgruntled ex-employee looking to settle scores and an admitted leaker whose Congressional testimony had to be corrected almost immediately. Trump's press secretary Sarah Huckabee Sanders said last week that "one of the president's greatest achievements will go down as firing director James Comey" and Trump himself wrote on Twitter over the weekend that Comey "will go down as the WORST FBI Director in history, by far!"

"This is not some tin pot dictatorship where the leader of the country gets to say 'the people I don't like go to jail.' Our Lady Justice wears a blindfold. And the reason all those statues all over the country have a blindfold is, that's the way it has to be," Comey told NPR. "Lady Justice can't be peeking under the blindfold to see if Donald Trump wants her to convict so-and-so and not convict so-and-so. If we lose that, we've lost the rule of law, and so there's great danger in the president of the United States saying 'you should be in jail.'"

Asked about the potential that he might one day run for office, Comey was emphatic that he had no such plans. Instead, he said he plans to teach at the university level and give speeches on ethics and leadership.

"Never. I will never run for office. Not even a close call," he said. "I'm going to teach about leadership and ethics, and so I'm going to be a professor, which is exciting, and speak about leadership… I'm going to use my book in the class and I'm going to buy it for the students, because I'm not going to be one of those professors."

Cincinnati Enquirer: EPA Head Scott Pruitt in Cincinnati

U.S. Environmental Protection Agency Administrator Scott Pruitt visited Cincinnati Monday. He spent part of his day Monday, according to a tweet, with Greater Cincinnati Water Works officials and workers regarding the replacement of lead pipes. He also visited the federal EPA's Cincinnati Office of Research and Development near the University of Cincinnati. "This is a model for cities across the country should look at in order to invest in the future of our children," Pruitt tweeted.

Bloomberg Environment: Pruitt Seeks Quicker Superfund Cleanups at Three Targeted Sites

EPA Administrator Scott Pruitt put the spotlight on three more Superfund sites to accelerate cleanup efforts after the agency targeted those sites for a lack of progress. The Environmental Protection Agency named the sites in California, Delaware, and Minnesota April 16 after the agency's regional staff said they needed a push from the administrator, Albert "Kell" Kelly, Pruitt's senior adviser on Superfund issues, told Bloomberg Environment.

AMERICAN OVERSIGHT

Las Vegas Review Journal: Nevada's Anaconda Mine Removed from EPA Superfund List

An agreement reached between Nevada and the Environmental Protection Agency has kept the Anaconda Copper Mine off a Superfund list, with cleanup now being directed by the state and funded by a private company, officials said Monday. Pruitt released a list of potential Superfund sites Monday that no longer includes the Nevada mine. The list also excludes the San Jacinto River Waste Pits in Texas. Three sites in California, Delaware and Minnesota were targeted by the EPA for immediate and intense cleanup efforts and put on a list for Superfund inclusion. "We are making tremendous progress expediting sites through the entire Superfund remediation process," Pruitt said in a statement. Pruitt said the updated list "reflects our commitment to addressing Superfund sites as quickly and safely as possible."

Bloomberg Environment: Smaller Bites in EPA Air Chief's Second Pass at Permitting Updated

William Wehrum has unfinished business with the EPA's air pollution permitting program for factories and power plants that want to expand or make major upgrades to their facilities. "This time around," Wehrum told Bloomberg Environment in an exclusive April 13 interview, "it's important to strike a better balance." Already, the EPA has issued two industry-coveted tweaks to the permitting program through guidance documents.

EPA Head Scott Pruitt in Cincinnati

By Carrie Blackmore Smith, 4/16/18

U.S. Environmental Protection Agency Administrator Scott Pruitt visited Cincinnati Monday.

He spent part of his day Monday, according to a tweet, with Greater Cincinnati Water Works officials and workers regarding the replacement of lead pipes. He also visited the federal EPA's Cincinnati Office of Research and Development near the University of Cincinnati.

"This is a model cities across the country should look at in order to invest in the future of our children," Pruitt tweeted.

Cincinnati, like many older cities, constructed its system with lead pipes at the start of the last century.

Water Works has made it a priority to replace all lead pipes with copper in order to reduce

AMERICAN OVERSIGHT

exposure to lead in drinking water. Lead can cause all sorts of health problems, including developmental delays, high blood pressure and heart disease.

"We appreciated the visit today from Administrator Pruitt. The visit gave us a chance to explain our enhanced lead program that includes education, outreach and removal of lead service lines," said water works Director Cathy Bailey. "Our program wasn't mandated by regulations, but implemented because it is the right thing to do for our community, and we believe it can serve as a model across the country."

New research found a correlation between lead and cardiovascular disease, too. It affects children at a higher rate than adults because their brains are still developing.

The response in Twitter was fierce, with some playing off his use of #gettheleadout.

Bloomberg Environment

Pruitt Seeks Quicker Superfund Cleanups at Three Targeted Sites

By Sylvia Carignan and Stephen Joyce, 4/16/18

EPA Administrator Scott Pruitt put the spotlight on three more Superfund sites to accelerate cleanup efforts after the agency targeted those sites for a lack of progress.

The Environmental Protection Agency named the sites in California, Delaware, and Minnesota April 16 after the agency's regional staff said they needed a push from the administrator, Albert "Kell" Kelly, Pruitt's senior adviser on Superfund issues, told Bloomberg Environment.

Kelly expects that push to come in the form of an expedited cleanup plan decision or quicker negotiations for each of the sites.

Pruitt also removed two sites from the list of those needing immediate action.

The sites EPA added to the list are Delaware Sand and Gravel Landfill in New Castle, Del., Casmalia Resources in Casmalia, Calif., and St. Regis Paper Co. in Cass Lake, Minn.

Kelly said hard and fast criteria aren't necessarily used when adding sites to the administrator's list.

"The criteria has some subjectivity to it, because it has to be sites [where] regions believe

AMERICAN OVERSIGHT

attention from the administrator will help them get to whatever milestone," Kelly said.

Cass Lake, Minn.

Pruitt aims to finalize a residential soil cleanup plan for the St. Regis Paper Co. site.

Remediating the Minnesota site "has been a very long and difficult process," Sara Peterson, a lawyer representing Cass Lake, Minn., the city where the property is located, told Bloomberg Environment.

The site contains soils and groundwater possibly contaminated by dioxins, pentachlorophenol, and polycyclic aromatic hydrocarbons, according to an EPA fact sheet on the site.

From the 1950s to the 1980s, Champion Paper Co.—a predecessor company to the site's current owner, Memphis, Tenn.-based International Paper Co.—manufactured treated wood for railroad ties and telephone poles.

Thomas Ryan, a spokesperson for International Paper, told Bloomberg Environment the company is working with the EPA and other parties at the Superfund site.

The city is anxious for the site's environmental cleanup to be completed, Peterson said.

"They need the jobs that would come with the redevelopment of this site, and they've got some potential opportunities out there. But having a Superfund site there at this point makes it awfully hard to market the site," she said.

A March 2016 EPA-proposed plan recommended removing contaminated soil from affected residential areas and replacing it with clean soil, managing removed soil on site, disposing of a small amount of heavily contaminated soil at an off-site facility, and monitoring soil stored on site.

Casmalia, Calif.

The Casmalia Resources site in California was a commercial hazardous waste treatment, storage, and disposal facility spanning more than 250 acres.

The EPA finalized a $590,722 settlement in November with 57 of the companies that contributed waste to the landfill. Those companies include Nestle, Leidos Inc., Hubbell Inc., and Hearst Corp.

None of those companies responded to Bloomberg Environment's emails or calls about the site's addition to Pruitt's list.

In addition, companies and government agencies involved with the Delaware site did not respond to Bloomberg Environment's requests for comment.

AMERICAN OVERSIGHT

Setting Deadlines

The EPA also provided updates April 16 about each of the other sites on Pruitt's "immediate, intense action" list.

At the Mohawk Tannery site in Nashua, N.H., the agency wants to propose a cleanup plan this summer. The EPA is negotiating an agreement with a prospective purchaser who would redevelop the site.

For two New Jersey sites, American Cyanamid Inc. in Bound Brook and Berry's Creek in Wood Ridge borough, the agency wants to propose cleanup plans by the end of this spring.

The agency also wants to propose a cleanup plan for the Superfund site in East Chicago, Ind. his summer. The EPA is working on cleaning up lead-contaminated soil at parts of the site.

Delisted Sites

Pruitt already has made major cleanup decisions at the two sites removed from the list, the Anaconda Copper Mine in Yerington, Nev., and San Jacinto River Waste Pits outside Houston.

The EPA agreed in February to allow Nevada to oversee the cleanup of the Anaconda site, owned by Atlantic Richfield Co., after the state sought to assume control and work with private parties for a quicker resolution.

The former mine site had been under consideration to be added to the EPA National Priorities List so it could qualify for long-term cleanup and federal funding. The state last year asked the agency to defer the mine listing except for areas on tribal lands.

The San Jacinto River Waste Pits site contains paper mill waste material, including highly toxic dioxins, generated in the bleaching of wood pulp to make paper, the EPA said.

Pruitt announced a $115 million plan in October for the pits that entails excavating more than 212,000 cubic yards of contaminated waste.

Superfund sites are the most contaminated in the country, and include the Gowanus Canal in New York, Portland Harbor in Oregon, and Tar Creek in Oklahoma. Properties with EPA's Superfund designation are eligible to receive federal funds for cleanup, though the agency aims to compel companies responsible for the sites to pay the cleanup bills.

AMERICAN OVERSIGHT

Nevada's Anaconda Mine Removed From EPA Superfund List

By Gary martin, 4/16/18

An agreement reached between Nevada and the Environmental Protection Agency has kept the Anaconda Copper Mine off a Superfund list, with cleanup now being directed by the state and funded by a private company, officials said Monday.

Nevada Gov. Brian Sandoval and EPA Administrator Scott Pruitt signed a National Priorities List Deferral Agreement on Feb. 5 that puts the state in control of expedited cleanup and preparation for reuse of the property.

"Since Governor Sandoval took office and before, the state has worked to develop a long-term plan to clean up the site with a secure source of funding," said Mary-Sarah Kinner, the governor's spokeswoman.

Pruitt released a list of potential Superfund sites Monday that no longer includes the Nevada mine.

The list also excludes the San Jacinto River Waste Pits in Texas. Three sites in California, Delaware and Minnesota were targeted by the EPA for immediate and intense cleanup efforts and put on a list for Superfund inclusion.

"We are making tremendous progress expediting sites through the entire Superfund remediation process," Pruitt said in a statement.

Pruitt said the updated list "reflects our commitment to addressing Superfund sites as quickly and safely as possible."

The EPA administrator visited the Nevada and Texas sites as part of his effort to make timely decisions for cleanup of the sites and ensure protection of health and the environment for the surrounding communities.

During the Obama administration, the EPA proposed adding the Anaconda Copper Mine, which opened in 1918, to the Superfund National Priorities List to make it eligible for federal remedial funds.

Last year Atlantic Richfield Co. approached Nevada and proposed to fund implementation of a sitewide remedy for the mine. The company bought the mine in 1978.

Sandoval asked EPA in July to defer placing the copper mine on the Superfund list. Sandoval, the Nevada Division of Environmental Protection, Native American tribes and other stakeholders worked with the EPA to keep the site off the national priorities list.

AMERICAN OVERSIGHT

Pruitt granted the request after the EPA determined cleanup efforts meet federal requirements.

In February, Sandoval called the signing of the agreement with the EPA a "landmark day." He said the state and Atlantic Richfield would work in partnership on the remaining cleanup, which is expected to take another decade.

The Trump administration has proposed cutting spending at the EPA, and funds for the Superfund program.

With cleanup under administration by the state, and Atlantic Richfield pledging to fund the process, state officials see the decision on a deferred listing as a move to secure funding for cleanup of leaching fields at the old mine where chemicals were used to strip copper from rock.

As a result of this public-private partnership, there was no need for the EPA administrator's office to continue tracking the mine site, Kinner said. The site will remain proposed for the national priority list until cleanup is completed under Nevada Division of Environmental Protection oversight.

Cleanup actions under the Superfund program have historically been slow, expensive and process-laden, according to the state agency.

The mine is located in Lyon County near the town of Yerington.

Bloomberg Environment

Smaller Bites in EPA Air Chiefs Second Pass at Permitting Update

By Jennifer Lu, 4/16/18

William Wehrum has unfinished business with the EPA's air pollution permitting program for factories and power plants that want to expand or make major upgrades to their facilities.

In his first stint at the Environmental Protection Agency in an acting capacity, Wehrum tried to address industry criticism over the permitting program, known as new source review, with sweeping rulemaking bundles.

His efforts were either dropped after the George W. Bush administration withdrew his nomination to head the Office of Air and Radiation in 2007, blocked by the courts, or undone by the incoming Obama administration.

AMERICAN OVERSIGHT

"This time around," Wehrum told Bloomberg Environment in an exclusive April 13 interview, "it's important to strike a better balance."

Already, the EPA has issued two industry-coveted tweaks to the permitting program through guidance documents.

The new source review program requires factories and power plants to install costly new air pollution controls when they expand or make modifications that increase their emissions.

Industries have long complained that securing compliance with the permitting program is tedious, time consuming, and confusing. Updating how the EPA administers the program through guidance documents is one way to quickly address those concerns.

"There are a lot of current issues within [new source review] that we can provide clear guidance through guidance," Wehrum said. "Our strategy is to tell people sooner rather than later how we think the program should be implemented."

Did You Get the Memo?

The focus on bite-sized updates to EPA programs comes after Wehrum watched a series of ambitious regulations he helped craft—from toxic air pollution rules from the power industry to attempts to set up an emissions trading program for power plants—get overturned by judges during his last go-round at the agency between 2005-2007.

Back then, Wehrum didn't have the option to quickly update policy through guidance. Only since a 2014 U.S. Supreme Court decision in Perez v. Mortgage Bankers Association have federal agencies like the EPA been allowed to issue guidance such as policy memos without having to go through a lengthy public comment process.

"We have an interest in trying to do some things quickly, and especially in case-specific circumstances where clarity is lacking," Wehrum said.

However, policy made through guidance memos can be just as easily undone by a new administration, John Walke of the Natural Resources Defense Council, who previously served in the EPA General Counsel's Office, told Bloomberg Environment.

Environmental groups like Walke's and some states have already sued the EPA over one of its guidance documents, which eased toxic pollution emissions standards for industry.

"Industry relies upon Bill Wehrum's guidance at its peril," Walke said.

Everything Old is New Source Review Again

But updating the permitting program has long been an industry priority. It was repeatedly spotlighted by businesses when the EPA put out a call for regulations that should be revised or

AMERICAN OVERSIGHT

eliminated.

After past regulatory efforts to make it industry-friendly fizzled, the fastest way to address business concerns is through guidance, Richard Alonso, environmental attorney at Sidley Austin LLP's Washington, D.C., office, told Bloomberg Environment.

Already, the EPA has issued two memos on two new source review changes. A December memo told agency staff not to "second-guess" how facilities calculate emissions changes.

That was followed by a March memo on project emissions accounting, also known as project netting, which tells facilities how to calculate whether emissions from their proposed new construction projects would increase pollution. Under the new guidance, facilities can include emissions decreases from their projects to the overall calculations to avoid triggering new source review.

The memo drew inspiration from a 2006 rule changing three aspects of emissions counting under new source review, which lost traction after Wehrum left the agency.

"Finalizing this [2006] rulemaking would help to remove a substantial burden to energy and manufacturing projects," Louis Renjel, vice president of federal government affairs and strategic policy at Duke Energy, wrote in response to an EPA call for suggestions on reducing regulatory burdens.

The American Chemistry Council also asked the EPA to revisit the reforms proposed during the Bush-era EPA, whether through guidance, regulation, or legislation.

The EPA this summer aims to address project aggregation, another piece of new source review reform from Wehrum's 2006 rulemaking bundle.

It would define how emissions from separate modifications that take place around the same time should be counted, according to a presentation Anna Marie Wood, director of the EPA's Air Quality Policy Division, gave at a state air regulators conference April 5.

More Guidance Coming

Three more guidance memos are slated to be issued this spring, according to Wood's presentation.

One would redefine what counts as "ambient air," or the air the general public breathes. This definition is important to new source review because facilities must show that their post-construction emissions won't worsen air quality according to the national standards, Lynn Hutchinson, the EPA new source review project lead in 2002, told Bloomberg Environment.

Another guidance document in the works would change the pollutant modeling used to decide whether emissions would damage air quality. The White House completed its review of the memo April 12.

AMERICAN OVERSIGHT

A third spring guidance document would allow the EPA to revive an attempt to expand the kinds of routine maintenance and repairs excluded from new source review. That 2003 rule was vacated by the U.S. Court of Appeals for the District of Columbia Circuit in New York v. EPA in 2006, which said industries could not write off physical changes that cost below a certain amount as routine maintenance.

"You already have a court on record saying those particular reforms are not allowed, so those might be a heavier lift without notice and comment rulemaking," Alonso said.

When asked how he will ensure that his current batch of reforms stick beyond the current administration, Wehrum said, "a piece of it is making change that will last, but the bigger piece of it, for me, again, is just from a public policy standpoint."

"If people can't look at our rules and know what they need to do to comply, then we've got a problem," he said.

Reuters

https://www.reuters.com/article/us-usa-trump-russia-cohen/foxs-hannity-revealed-as-mystery-client-of-trumps-personal-lawyer-idUSKBN1HN12G

Fox's Hannity Revealed as Mystery Client of Trump's Personal Lawyer

By Brendan Pierson, Karen Freifeld, Jonathan Stempel, 4/16/18

U.S. President Donald Trump's personal lawyer was forced on Monday to reveal in a New York federal court that Fox News personality Sean Hannity, one of Trump's most ardent defenders, was also on his client list.

Michael Cohen, Trump's fiercely loyal and pugnacious lawyer, disclosed Hannity's name through one of his own lawyers at the order of the judge. Stormy Daniels, an adult-film actress who says she had a sexual encounter with Trump, watched from the public gallery.

Daniels, in a separate civil case, is fighting a 2016 non-disclosure agreement arranged by Cohen in which she got $130,000 to stop her from discussing her claim she had sex with Trump a decade earlier, something Trump has denied.

Hannity, 56, said on Monday that he had never paid for Cohen's services or been represented by him, but had sought confidential legal advice from him. The conservative host often uses his weeknight broadcast on Fox News to defend the president against what he sees as biased attacks by the media. Sometimes Trump praises Hannity in return.

AMERICAN OVERSIGHT

Cohen was in court to ask the judge to limit the ability of federal prosecutors to review documents seized from his offices and home last week as part of a criminal investigation, which stems in part from a probe into possible collusion between Trump's presidential campaign and Russia. (Full Story)

The Russia investigation has frustrated the White House as it has spread to enfold some of Trump's closest confidantes.

Judge Kimba Wood spent more than 2-1/2 hours listening to arguments by Cohen's lawyers, prosecutors from the U.S. attorney's office in Manhattan and a lawyer representing Trump in the hearing. She is expected to rule later.

She ordered prosecutors to give Cohen's lawyers a copy of the seized materials before the next hearing.

The unexpected naming of Hannity made him the latest prominent media personality to be drawn into the investigation's cast of unlikely supporting characters.

Daniels, whose real name is Stephanie Clifford, was another. As she arrived at the courthouse dressed in a lavender suit, photographers knocked over barricades as they scrambled to get pictures.

Daniels sat with her lawyer, Michael Avenatti, who told reporters they were there to help ensure protection for the integrity of the seized documents, some of which they believe pertain to the Daniels agreement.

Cohen, dressed in a dark suit, at times looked tense, folding and clasping his hands in front of him.

GASPS AND LAUGHTER

Cohen has argued that some of the documents and data seized from him under a warrant are protected by attorney-client privilege or otherwise unconnected to the investigation. But Judge Wood said she would still need the names of those other clients, and rejected his efforts to mask the identity of Hannity, a client Cohen had said wanted to avoid publicity.

"I understand if he doesn't want his name out there, but that's not enough under the law," Wood said, before ordering the name disclosed.

Stephen Ryan, a lawyer for Cohen, drew gasps and laughter from the public gallery when he named Hannity as the client.

After his identity was revealed, Hannity said on his syndicated radio show, and again later on his Fox News program, that he had "occasional, brief discussions" with Cohen in which he sought out Cohen's "input and perspective."

AMERICAN OVERSIGHT

Hannity said he assumed those discussions were covered by attorney-client privilege, and insisted that none involved any matter between himself and a third party. He also said his talks with Cohen "almost exclusively focused on real estate."'

Legal advice can be considered privileged even if given by a lawyer for free.

Hannity, the top-rated personality on the most watched U.S. cable news network, told his viewers on April 9 that the raid on Cohen was part an effort by federal investigators to wrongly impeach the president. He never mentioned his association with Cohen during that broadcast.

On Monday's show, Hannity expressed amusement at the firestorm of media coverage unleashed by the disclosure that he and Trump shared a legal adviser in Cohen, playing a 45-second, rapid-fire montage of various TV commentators and anchors uttering his name on the air throughout the day.

Cohen has asked the court to give his own lawyers the first look at the seized materials so they can identify documents that are protected by attorney-client privilege. (Full Story)

Failing that, they want the court to appoint an independent official known as a special master, a role typically filled by a lawyer, to go through the records and decide what prosecutors can see.

But prosecutors want the documents to be reviewed for attorney-client privilege by a "taint team" of lawyers within their own office, who would be walled off from the main prosecution team.

"I have faith in the Southern District U.S. Attorney's Office that their integrity is unimpeachable," making a taint team "a viable option," Judge Wood said.

But she also said that to help ensure fairness and the perception of fairness, "a special master might have some role here."

After the hearing, Cohen left without comment.

Daniels, in contrast, stepped up to the bank of microphones set up on the sidewalk, telling reporters that Cohen had thought he was above the law.

"My attorney and I are committed that everyone finds out the truth and the facts of what happened, and I will not rest until that happens," she said.

Washington Free Beacon

http://freebeacon.com/national-security/ex-cia-chief-says-obama-rejected-cyber-action-russia-election-meddling/

AMERICAN OVERSIGHT

Ex-CIA Chief Says Obama Rejected Cyber Action Against Russia for Election Meddling

By Bill Gertz, 4/17/18

Despite an unprecedented Russian intelligence operation to influence the 2016 presidential election, former President Barack Obama rejected a plan to conduct retaliatory cyber action against Moscow during the campaign, according to former CIA Director John Brennan.

Brennan disclosed Saturday that Obama opposed a plan to carry out "a cyber event" against the Russians because the former president feared the action would lead to more aggressive interference by Moscow.

"There was consideration about rattling their cages with some type of cyber event," Brennan said during remarks to a journalism conference at the University of California Berkeley.

But based on Obama's fears, the planned cyber action was shelved in favor issuing vague warnings to Russian officials. Brennan did not elaborate on the cyber retaliation plan.

"President Obama was the ultimate decision-maker on that," Brennan said of the lack of response.

The former CIA director defended the Obama administration's handling of what is widely viewed as a significant counterintelligence failure during the presidential election.

After the election, Obama ordered the expulsion of 35 Russian intelligence officers.

Both the FBI and CIA are charged with the conducting counterintelligence–detecting and thwarting hostile intelligence operations. Both agencies failed to halt the Russians in 2016 either in the United States or abroad.

U.S. officials have said the targeting of U.S. and foreign elections by Russia is continuing.

President Trump in February criticized his predecessor in a Tweet for failing to act. "Why didn't Obama do something about the meddling? Why aren't Dem crimes under investigation? Ask Jeff Sessions!" he tweeted.

The disclosure that Obama scrapped a cyber plan to retaliate against Moscow for election interference comes as a former senior counterintelligence official, Michelle Van Cleave, revealed in congressional testimony last week that the Obama administration weakened American counterintelligence programs by downgrading a top counterspy office.

Brennan said he had "great confidence" the Russian influence operation was authorized and directed by Russian President Vladimir Putin, a former KGB intelligence officer. The Russian

AMERICAN OVERSIGHT

intelligence services also "know what the mission is, know what their capabilities are, and will apply them to issues that are of interest to Russian national security," he said.

Brennan called the meddling "unprecedented in terms of its scope and intensity, and made full use of the digital domain."

The first indications of Russian interference were spotted in late 2015 and early 2016 and the operation was mentioned in press reports in the spring of 2016. By the summer of 2016 the operations were confirmed, he said.

Obama also made clear to the CIA that he did not want the agency doing anything "in reality or in perception" that would have advanced the Russian disinformation and propaganda campaign, Brennan said.

"We were really trying to strike the right balance between doing everything we could to prevent and thwart as well as to uncover and understand what the Russians were doing without doing anything that would almost advance their interests in trying to disrupt our election," he said.

Obama also was afraid any U.S. action against the Russians might be perceived as an outgoing Democratic president working to influence the election outcome.

"So if we did more things and stood at the hilltops and cried out, 'the Russians, the Russians are trying to help Trump get elected,' and if President Obama who is the titular head of the Democratic Party were to do that, I think that there would have been a lot of people would believe, I think with some justification, that the President of the United States was trying to influence the outcome of a presidential election," Brennan said.

Brennan also said the Obama administration opposed aggressive action because of the president's belief that any effort to punish the Russian might produce stepped up activities.

Russian hackers had been detected navigating inside state election voter registration roll computers and other election-related networks.

"They had things that they could have done that they didn't do," Brennan said of the Russians.

Intelligence agencies concluded in a report issued in early 2017 that Russian civilian and military intelligence agencies conducted an aggressive operation to sow social discord during the 2016 election by opposing Hillary Clinton while seeking to boost Donald Trump's campaign.

The Russian operation included the use of advertising on social media platforms like Facebook, and cyber attacks involving the cyber theft of emails and postings online using covert internet personas.

In February, 13 Russians were indicted by Special Counsel Robert Mueller for running a St. Petersburg, Russia-based internet troll farm that carried out influence operations during the elections.

AMERICAN OVERSIGHT

So far, no action has been taken against the Russian hackers engaged in email thefts.

Kenneth deGraffenreid, former deputy national counterintelligence executive, said Obama's inaction was a major counterintelligence failure.

"If Brennan's claims are true, the Obama administration's inaction in the face of this Russian cyber aggression represents a serious counterintelligence failure that has had terrible consequences," deGraffenreid said.

"Good counterintelligence requires an active element beyond collecting and analyzing the secret information that has been uncovered–namely countering this serious foreign intelligence threat in an effective way. The U.S. has the sophisticated tools to do this."

"There simply is no excuse for not doing so," he added. "Our national security depends on American leaders taking the action required."

Despite signs the operation had been underway since 2015, Brennan said he was the first U.S. official to protest the matter during an Aug. 4, 2016, telephone to Alexander Bortnikov, head of Russia's FSB security service.

"I told him rather directly that if the Russians were to go down this road, they would pay a significant price," Brennan said. "I told him that all Americans would be outraged by a Russian effort to try and interfere in our election."

A month later at the G-20 summit in China, Obama confronted Putin about the election interference, according to Brennan.

Weeks later, Director of National Intelligence James Clapper and Homeland Security Secretary Jeh Johnson issued an official statement accusing the Russian government of interfering with the election campaign.

Brennan said he believes the softline Obama policy dissuaded Moscow from intensifying the campaign and that he had no regrets.

Additionally, the former CIA chief said he has spoken to Obama who he asserted is "very comfortable with what we did and didn't do."

"I would argue that I think by pushing them back a bit and confronting them with it, both privately as well as publicly, I think we did dissuade them from even going further," he said.

Brennan also said the CIA was told by Obama not to take any action on the Russian intelligence operation over concerns any action would appear the administration was trying to support the Democratic candidate, Hillary Clinton.

Since leaving office, Brennan has been a Trump critic, taking to Twitter to call the president a

AMERICAN OVERSIGHT

"charlatan," "demagogue," and "snake oil salesman."

Brennan said that criticism has cost him financially as "a number of opportunities were rescinded."

Russian cyber intelligence operations are sophisticated and difficult to track, he said.

"And so I fully anticipate that the Russians and others are going to take advantages that are there," Brennan said. "They are going to try to hide their footprints better. They're going to try to prevent the U.S. from understanding what may be happening there. But let's not make a mistake, that environment is ripe for mal actors and they are going to continue to cause us problems."

On the controversial dossier produced by former British intelligence officer Christopher Steele, Brennan said the dossier may have been part of a Russian cover operation.

"Well certainly it could be," he said. "I don't know the provenance of the information. As I said I've seen the dossier. It is done by a former accomplished member of the British intelligence service, MI-6. It is sourced to unnamed sources and subsources that alleged these types of activities. So I don't know whether the information in it–some, all or none–is valid or not."

Brennan said he does not believe Steele was manipulated by the Russians for intelligence purposes.

"I do not believe he is acting on behalf of them," he said. "Might he have been unwittingly used? Maybe. So I don't know."

The Steele dossier was funded by the Democratic National Committee and the Clinton campaign through the research group Fusion GPS.

The Washington Free Beacon hired Fusion GPS to conduct research on Republican candidates but had no role in the dossier.

On his political views, Brennan said he is not a member of any political party and described himself as "an avowed nonpartisan."

In 2016, Brennan disclosed that in 1976 he voted for the Moscow-backed Communist Party USA candidate for president, Gus Hall, during the height of the Cold War.

Comey on Trump Calling for Him to Be Jailed: 'This Is Not OK'

AMERICAN OVERSIGHT

By Louis Nelson, 4/17/18

Former FBI Director James Comey denounced Donald Trump's presidency as a threat to bedrock American values, warning that the president's calls for Comey to be jailed could erode the rule of law.

The former FBI director, whom Trump fired last spring, has been a frequent target of Trump's criticism, especially in recent days amid the start of a publicity tour for Comey's book, which was released Tuesday. Comey has been deeply critical of the president, characterizing him as morally unfit to occupy his office, while Trump has labeled the former FBI director as a liar and leaker, suggesting he be sent to jail.

"President Trump, I don't follow him on Twitter but I get to see his tweets tweeted, I don't know how many, but some tweets this past couple of days that I should be in jail. The president of the United States just said that a private citizen should be jailed. And I think the reaction of most of us was, 'meh, that's another one of those things.' This is not normal. This is not OK," Comey told NPR in an interview broadcast Tuesday morning. "The reason I'm talking in terms of morality is, those are the things that matter most to this country. And there's a great danger we'll be numbed into forgetting that, and then only a fool would be consoled by some policy victory."

While Comey's criticism of the president, both in interviews and in his book, has been withering, so too has the White House's response. Trump administration officials have painted Comey as a disgruntled ex-employee looking to settle scores and an admitted leaker whose Congressional testimony had to be corrected almost immediately. Trump's press secretary Sarah Huckabee Sanders said last week that "one of the president's greatest achievements will go down as firing director James Comey" and Trump himself wrote on Twitter over the weekend that Comey "will go down as the WORST FBI Director in history, by far!"

"This is not some tin pot dictatorship where the leader of the country gets to say 'the people I don't like go to jail.' Our Lady Justice wears a blindfold. And the reason all those statues all over the country have a blindfold is, that's the way it has to be," Comey told NPR. "Lady Justice can't be peeking under the blindfold to see if Donald Trump wants her to convict so-and-so and not convict so-and-so. If we lose that, we've lost the rule of law, and so there's great danger in the president of the United States saying 'you should be in jail.'"

Asked about the potential that he might one day run for office, Comey was emphatic that he had no such plans. Instead, he said he plans to teach at the university level and give speeches on ethics and leadership.

"Never. I will never run for office. Not even a close call," he said. "I'm going to teach about leadership and ethics, and so I'm going to be a professor, which is exciting, and speak about leadership… I'm going to use my book in the class and I'm going to buy it for the students, because I'm not going to be one of those professors."

Third parties that want to take on Superfund site projects can expect more personalized attention and customized agreements from the EPA, as the agency moves to redevelop contaminated properties. The Environmental Protection Agency is targeting companies' contamination liability concerns at the site level, pushing more tailored, site-specific agreements in addition to using agency-wide guidance, Cyndy Mackey, director of the agency's Office of Site Remediation Enforcement, told Bloomberg Environment May 3. Those changes are enticing more private investors to step in, clean up, and redevelop the country's most contaminated sites, the agency said.

Politico: EPA Narrows Guidelines for Aggregating Sources for Air Permitting

EPA will alter its interpretation of when related facilities are considered a single source for air permitting purposes in a way that could ease their permitting requirements. Permitting rules say that plants located near each other should be aggregated for permitting purposes if they are operated by the same entity, known as "common control." In that case, the facilities' emissions can be aggregated and be subject to more stringent permitting requirements than if treated separately. In an April 30 memo concerning a common control designation for a Pennsylvania landfill and nearby biogas processing facility that are owned by different companies, EPA air chief Bill Wehrum revised the agency's interpretation so that facilities meet the definition if one entity has "the power or authority … to dictate decisions of the other that could affect the applicability of, or compliance with, relevant air pollution regulatory requirements."

EPA Tailoring Superfund Agreements for Concerned Companies

By Sylvia Carignan, 5/3/18

Third parties that want to take on Superfund site projects can expect more personalized attention and customized agreements from the EPA, as the agency moves to redevelop contaminated properties.

The Environmental Protection Agency is targeting companies' contamination liability concerns at the site level, pushing more tailored, site-specific agreements in addition to using agency-wide guidance, Cyndy Mackey, director of the agency's Office of Site Remediation Enforcement, told Bloomberg Environment May 3.

Those changes are enticing more private investors to step in, clean up, and redevelop the country's most contaminated sites, the agency said.

Renewed Interest

Those third parties are often environmental remediation companies and redevelopers that are willing to take on cleanup risks. The site-specific agreements address their concerns regarding their responsibilities at contaminated sites and the potential for future liabilities.

"We have seen an uptick in interest with those agreements," Mackey said.

Previously, third parties interested in Superfund sites had to rely on statutory protections to determine whether they are liable for contamination. The site-specific approach, which

AMERICAN OVERSIGHT

comes from the agency's Superfund task force, helps manage third parties' cleanup expectations and liability concerns, she said.

EPA Administrator Scott Pruitt's task force specifically focuses on making changes to the Superfund program that don't require legislation. In more than 40 recommendations, the task force details administrative ways the agency can ensure accountability, accelerate cleanup, and prepare sites for reuse.

Superfund sites are the most contaminated in the country, and include the Gowanus Canal in New York, Portland Harbor in Oregon, and Tar Creek in Oklahoma. Properties with the EPA's Superfund designation are eligible to receive federal funds for cleanup, though the agency aims to compel companies responsible for the sites, or third parties, to pay the cleanup bills.

From HQ to Regions

The two types of site-specific agreements that the EPA seeks to promote are bona fide prospective purchaser agreements and prospective purchaser agreements. The EPA's headquarters office is encouraging regional offices to use them more frequently. Both require the approval of the Department of Justice.

The bona fide prospective purchaser provision in the 2002 brownfields act protects landowners from liability for cleanup costs. The agreement is valid only if they meet certain conditions. These include reviewing records and inspecting the site for the presence or possibility of contamination, demonstrating that the purchaser is not affiliated with any liable party, complying with land use restrictions, and cooperating with information requests.

Prospective purchaser agreements center on the EPA's promise not to sue a party that could buy contaminated property. Certain conditions also must be met for these agreements.

The agency also is reviewing the content of those agreements to determine whether their templates should be revised, the EPA noted in guidance signed April 17.

Third-Party Liability

But third parties looking to take on contaminated sites may have another reason to hesitate, after an April 27 ruling from the U.S. Court of Appeals for the Ninth Circuit.

In California Department of Toxic Substances Control v. Westside Delivery, the court ruled that a third party, Westside Delivery, was liable for the costs of cleanup the state performed at Westside's contaminated property in Los Angeles.

Westside acquired the property in a tax sale and didn't interact directly with the original owner, the Davis Chemical Co., which recycled spent solvents at the site. A 1992 EPA assessment of the site found significant spillage, according to court documents.

AMERICAN OVERSIGHT

The defendant argued that it was protected from liability under Superfund law, but the court disagreed.

"This decision reinforces the golden rule of acquiring industrial property—look before you leap," Peter Hsiao, partner at Morrison Foerster LLP in Los Angeles, told Bloomberg Environment in an email. Hsiao's practice includes Superfund litigation and other types of environmental law.

On the other hand, the case may not affect many third parties that are interested in buying contaminated sites, Bart Seitz, partner at Baker Botts LLP in Washington, told Bloomberg Environment.

"On the narrow facts of this case, I don't think it's that common," he said. Seitz represents companies involved in Superfund litigation.

The EPA is reviewing the court's decision and will determine whether any changes need to be made to site-specific agreements or guidance, Mackey said.

EPA Narrows Guidelines for Aggregating Sources for Air Permitting

By Alex Guillen, 5/3/18

EPA will alter its interpretation of when related facilities are considered a single source for air permitting purposes in a way that could ease their permitting requirements.

Permitting rules say that plants located near each other should be aggregated for permitting purposes if they are operated by the same entity, known as "common control." In that case, the facilities' emissions can be aggregated and be subject to more stringent permitting requirements than if treated separately.

In an April 30 memo concerning a common control designation for a Pennsylvania landfill and nearby biogas processing facility that are owned by different companies, EPA air chief Bill Wehrum revised the agency's interpretation so that facilities meet the definition if one entity has "the power or authority … to dictate decisions of the other that could affect the applicability of, or compliance with, relevant air pollution regulatory requirements."

AMERICAN OVERSIGHT

A dependent relationship should not necessarily mean common control, he added. Facilities can be "economically or operationally interconnected" without being able to direct the other.

In the immediate case of the Pennsylvania landfill and processing plant, Wehrum concluded that the two are not commonly controlled because the landfill could otherwise meet methane emissions limits by burning off biogas and because the processing plant hopes to secure other sources of biogas.

WHAT'S NEXT: Ultimately, EPA's reasoning is only a recommendation. Pennsylvania regulators have the final say on whether these particular facilities fall under "common control."

Washington Examiner

US Charges Ex-Volkswagen CEO Martin Winterkorn in Emissions Scandal

By James Langford, 5/3/18

A federal grand jury has charged former Volkswagen CEO Martin Winterkorn with wire fraud in what prosecutors say was a long-running scheme to cheat diesel-emission standards for U.S. vehicles.

Winterkorn, 70, and other senior executives of the German carmaker conspired for about nine years to mislead investors and U.S. consumers about the ability of its "clean diesel" vehicles to comply with the country's rules, according to an indictment unsealed Thursday in U.S. District Court in Michigan. Winterkorn, who stepped down from the top job shortly after the federal investigation began, also faces three counts of wire fraud in a scandal that has weighed on the company's U.S. stock for more than two years.

"If you try to deceive the United States, then you will pay a heavy price," Attorney General Jeff Sessions, an appointee of President Trump, said in a statement. "The indictment unsealed today alleges that Volkswagen's scheme to cheat its legal requirements went all the way to the top of the company. These are serious allegations, and we will prosecute this case to the fullest extent of the law."

Environmental Protection AGency Administrator Scott Pruitt said the indictment sends "a clear message that EPA and its law enforcement partners will seek to hold corporate officers accountable for alleged criminal activities."

AMERICAN OVERSIGHT

According to the indictment, Winterkorn and other Volkswagen executives implemented software that made VW and Audi diesel vehicles appear to meet U.S. emissions standards when they didn't, thus boosting the company's sales and, potentially, their own incomes.

The so-called defeat device, which tightened engine emission controls enough to meet requirements when the software recognized a test was being performed, was developed after VW executives realized the carmaker was unable to build a diesel engine that was both compliant and had market appeal, prosecutors said.

Under normal driving conditions, which the software also recognized, the diesel engines' emission-control systems were much less effective, allowing them to pump as much as 35 times more nitrogen oxides into the environment than U.S. regulators allowed, according to the indictment. The pollutants contribute to both smog and acid rain.

The Justice Department and the EPA notified Volkswagen of the investigation in late September 2015, and the company promised to cooperate. Winterkorn relinquished his roles as CEO and chairman of the supervisory board five days later.

"I am doing this in the interests of the company, even though I am not aware of any wrong doing on my part," he said at the time. "Volkswagen needs a fresh start — also in terms of personnel. I am clearing the way for this fresh start with my resignation."

The company's U.S. shares have climbed 8.2 percent since the investigation was disclosed, trailing 32 percent growth on the broader S&P 500.

Volkswagen “continues to cooperate with investigations by the Department of Justice," said Pietro Zollino, a company spokesman. "It would not be appropriate to comment on individual cases.”

Months After Parkland Shooting, Trump to Embrace NRA in Rally-Like Speech

By Jeff Mason, 5/4/18

President Donald Trump, who briefly pledged to “fight” the National Rifle Association after a February mass shooting at a Florida high school, is expected to throw his full weight behind the powerful gun rights group on Friday at an event in Dallas.

AMERICAN OVERSIGHT

In addressing the gun lobbying group's annual convention, the Republican president will emphasize his support for gun rights in political terms, likely claiming again that Democrats want to take away Americans' firearms, a White House official said.

This will be Trump's fourth speech to the powerful NRA and, with control of the U.S. Congress up for grabs in November's midterm elections and campaigns under way, it is expected to include familiar warnings meant to excite the Republican voter base.

"These things typically are pretty 'rah, rah Second Amendment' types of addresses," the official said, adding that Trump likely will say that Democrats oppose the constitutional amendment that protects gun ownership.

The massacre that killed 17 people at Marjory Stoneman Douglas High School in Parkland, Florida, on Feb. 14 seemed to mark a turning point in America's long-running gun debate, sparking a youth-led movement for tighter gun controls.

Days after the shooting, Trump promised action on gun regulation and at a gathering of state officials, said this of the NRA: "We have to fight them every once in a while."

Since then, no major new federal gun controls have been imposed, although the administration is pursuing a proposed regulatory ban on bump stocks of the sort used in an October 2017 mass shooting in Las Vegas that killed 59 people.

A bump stock allows a semi-automatic rifle to fire like an automatic one. Semi-automatic assault rifles are sold widely in the United States, which has the world's highest per capita gun ownership rates. The NRA has fiercely defended America's gun ownership rights for many years, citing the Second Amendment.

RHETORICAL SHIFT

Since Parkland, Trump has largely moved his rhetoric back in line with the NRA, which endorsed him in his 2016 presidential election campaign and gave him its financial backing.

The group's convention in Texas will attract a strongly pro-Trump crowd, officials said, giving the president room to take some swipes at his opponents, review his record in office and complain about Special Counsel Robert Mueller's investigation of possible collusion between Trump's 2016 campaign and Russia.

The event was likely to be "reminiscent of rallies past," a second White House official said.

A Reuters/Ipsos poll found in March 2018 that 54 percent of adults wanted "strong regulations or restrictions" for firearms. That was up from 39 percent in a similar poll from April 2012.

Among Republicans in the poll, 40 percent wanted strong regulations or restrictions in

AMERICAN OVERSIGHT

March 2018, up from 22 percent in April 2012.

Trump met with NRA officials privately at the White House twice in February as he mulled policy responses to the shooting. He eventually endorsed an NRA proposal to arm teachers, a step the group said would help prevent mass school shootings. Gun control activists generally oppose that idea.

Trump initially expressed enthusiasm for measures to close loopholes for gun buyers seeking to avoid the background check system, raise the age limit for buying rifles, and find ways to seize guns temporarily from people reported to be dangerous.

He has since endorsed more modest proposals, such as legislation aimed at providing more data for the background check system. He did not endorse closing a loophole in existing law that would require background checks for guns bought at guns shows or sales arranged over the internet.

Special Counsel Robert Mueller Focusing Sharply on Links Between Trump Confidant Roger Stone and Former Campaign Official Rick Gates, Sources Say

By Brian Schwartz, 5/3/18

Special counsel Robert Mueller is focusing intensely on alleged interactions between former top Trump campaign official Rick Gates and political operative Roger Stone, one of President Donald Trump's closest confidants, according to sources with direct knowledge of the matter.

Stone, a longtime advisor to Trump, is apparently one of the top subjects of the Mueller investigation into potential collusion between the Kremlin and the Trump campaign, sources told CNBC on condition of anonymity.

The questions have been largely about what was discussed at meetings, including dinners, between Stone and Gates, before and during the campaign, said the sources, who have knowledge of the substance of the recent interviews.

In February, Gates pleaded guilty to two counts stemming from the Russia investigation, and he is cooperating with Mueller's probe.

AMERICAN OVERSIGHT

The new developments indicate that Mueller's team is interested in Stone beyond his interactions with Wikileaks founder Julian Assange during the campaign.

An attorney for Stone, Robert Buschel, did not deny discussions took place between his client and Gates, but sought to downplay their importance.

"Roger Stone did not have any substantive or meaningful interaction with Rick Gates during or leading up to the 2016 campaign," Buschel told CNBC in a statement.

An attorney for Gates declined to comment. The special counsel's office declined to comment.

The link between Gates and Stone goes back to their work at what had been one of the most powerful lobbying firms in Washington, which was founded by Stone along with former Trump campaign chairman Paul Manafort. The special counsel's probe has yielded two indictments against Manafort, who is accused of several crimes, including bank fraud and conspiracy against the United States.

Gates joined the firm as an intern more three decades ago, and it is unclear how much work he did with Stone at the time.

The firm, called Black, Manafort, Stone and Kelly, was known for its work to help improve the image of controversial politicians, including Ferdinand Marcos of the Philippines, Mobutu Sese Seko of the Democratic Republic of the Congo and the Russian-aligned former president of Ukraine, Viktor Yanukovych.

Gates joined the Trump campaign in the spring of 2016 and became Manafort's deputy. It was there where he became close to many of Trump's confidants. He remained with the campaign even after Manafort's ouster. Gates then worked on Trump's inaugural committee and co-founded the pro-Trump nonprofit group America First Policies.

In March, Gates was pulled into the Mueller inquiry when the special counsel's office filed a motion that claimed the former campaign aide had contact with a former agent of the Russian intelligence service in 2016. This came after Gates pleaded guilty to lying and conspiring against the United States, which could lead to possibly six years in prison. A sentencing date has yet to be announced.

For Stone, this is another potential hurdle in an ongoing investigation that continues to focus on him, among others.

Sam Nunberg, a former Trump campaign advisor, also said he was asked about Stone's involvement with Wikileaks during his interview before Mueller's grand jury in March.

"Roger is certainly a subject," Nunberg said. "The fact that Roger hasn't been called in and the special counsel continues to ask questions about Roger's possible activities during the election shows that at the very least he's a subject."

AMERICAN OVERSIGHT

Stone allegedly met with Assange, the Wikileaks founder, in August 2016. In an email leaked to The Wall Street Journal, Stone said, "I dined with my new pal Julian Assange last nite."

Stone has denied that he has met with the Wikileaks founder and said the email was in jest.

During the 2016 campaign, Wikileaks published emails allegedly stolen from the Democratic National Committee's servers by a Russia-linked hacker known as "Guccifer 2.0."

Wall Street Journal

https://www.wsj.com/articles/the-kentucky-derby-favorite-is-seeking-to-outrun-a-ghost-1525431686

The Kentucky Derby Favorite Is Seeking to Outrun A Ghost

By Jim Chairusmi, 5/4/18

Bob Baffert is a four-time Kentucky Derby-winning trainer with a stable full of champion thoroughbreds, most recently sweeping the Triple Crown with American Pharoah in 2015. He often works with the sport's best horses, so it wasn't particularly noteworthy when a young colt named Justify entered his barn late last year.

"I just can't remember offhand," Baffert said last month about his earliest memories of Saturday's Kentucky Derby favorite.

But it didn't take long for the 65-year-old Baffert to take notice, after he saw the chestnut colt breeze in a workout at Santa Anita Park.

The dirt track at Santa Anita is deep and many horses can struggle over the surface, Baffert said. But not Justify.

"The first time I worked him [there] I knew he was something really special," Baffert said. "He just went around there and just did it effortlessly. And that's when I knew he was really a cut above the rest."

Justify went on to win his debut race in February and is undefeated in three starts, securing a berth in the Kentucky Derby after an easy three-length win in the Santa Anita Derby on April 7. That was enough for Churchill Downs oddsmaker Mike Battaglia to tap Justify as the 3-1 favorite, even though the Run for the Roses will be Justify's first race outside of the

AMERICAN OVERSIGHT

state of California.

But besides trying to beat 19 rivals to the finish line on Saturday, Justify and Baffert are also running against history. A horse that didn't race as a 2-year-old hasn't won the Kentucky Derby since a gelding named Apollo accomplished the feat in 1882. Since statistics were first kept in 1937, 61 horses have entered the Derby without racing at the age of 2. All have lost and only eight of the 61 even finished in the top-3.

The Kentucky Derby, a race in which only 3-year-old horses are eligible, is a stiff test for still-maturing thoroughbreds, with a large field and a boisterous crowd of over 150,000 fans, contested at a distance (1 ¼ miles) farther than any horse in the field has ever run. As a result, the popular consensus among horsemen has been to establish a racing foundation for a horse at an early age before attempting to run in classic races such as the Derby, Preakness and Belmont Stakes.

"The lack of experience is a very tough thing to overcome but in the case of Justify, if he had started at 2, he might not be in the position he is in today as the favorite," said Simon Bray, a former trainer and current analyst for the racing network TVG. "Physically, he's so big. I don't think he would have been as developed racing as a 2-year-old.

Hall of Fame jockey Jerry Bailey said the most impressive part about Justify is how quickly he's turned into a star, akin to a freshman in high school making the leap straight to the NBA.

"Justify is particularly challenged because [in addition] to not racing at age 2, he didn't even race until Feb. 18."

The so-called Curse of Apollo is something Baffert has heard a lot about, having come within 1 1/2 lengths of breaking it in 2012, when his trainee Bodemeister, who also didn't race as a 2-year-old, was overtaken just steps from the wire by I'll Have Another.

"The Apollo thing," Baffert said. "Whether it happens this year or whatever, it will happen."

Baffert said a big reason the streak hasn't been broken is that trainers used to start horses much earlier in their racing careers, something he said isn't fully the case now. "Trainers take their time. They don't run them as early 2-year-olds anymore," he said. "So I think the game has changed."

Bailey said an "exceptional" talent can overcome a lack of race experience.

"In this day and age, an inexperienced horse that didn't race at the age of 2, isn't running against horses that have run 10 times, 12 times, like they did 25 years ago. Most of the horses in the field are relatively lightly raced, so the disparity isn't as great," said Bailey, who is now an analyst for NBC Sports.

AMERICAN OVERSIGHT

Trainer Todd Pletcher conditions Magnum Moon, the other late-developing, undefeated colt in this year's Derby field who is also looking to outrun the ghost of Apollo on Saturday.

"It's lasted long enough that I guess there has to be something to it. But I feel strongly that at some point someone's going to reverse the curse," Pletcher said.

Looking at the full field for the Derby, Bailey sees Justify as the likeliest winner.

"Magnum Moon is a good horse but I think Justify is several lengths faster than him. And probably several lengths faster than almost all of the field, except maybe Mendelssohn," said Bailey.

Coincidentally, the horse many consider to be the biggest threat to Justify in the Derby actually comes from the same bloodline. Mendelssohn—who secured a berth with an 18 1/2 length victory in the UAE Derby--and Justify were both sired by Scat Daddy. But horses by the same stallion, but birthed by a different dam (mother), are not considered related. Mendelssohn, conditioned by Irish trainer Aidan O'Brien, has won four of seven career starts.

Bray said he and Baffert were chatting one morning before the UAE Derby in Dubai when Baffert pointed to Mendelssohn.

"Baffert said, 'That horse is going to win the UAE Derby. The problem is, he's only the second-best Scat Daddy in the world right now. I have the best one.'"

Tulsa World: EPA Administrator Scott Pruitt says lack of clean up of Tar Creek Superfund site is 'unacceptable'

Administrator Scott Pruitt of the U.S. Environmental Protection Agency said his new push on the nation's Superfund program finally can provide clarity and accountability to the Tar Creek area, for decades one of the oldest, largest and most complex toxic sites in the nation. "It is really unacceptable," Pruitt said as he recalled the history of the Tar Creek area in far northeastern Oklahoma, whose Superfund legacy dates back to 1983, as well as the amount of money and time deployed there. "You don't list a site in the mid-1980s and you don't take the kind of steps we have taken historically and still have issues today in 2018."The area in Ottawa County is contaminated by lead and other heavy metals from long-closed mining operations and is undermined with caverns that are prone to cave-ins. The Picher and Cardin communities were bought out by a federal program and are now ghost towns, but the mine wastes remain.

Hot Air: EPA Ends The Use Of "Secret Science" In Crafting Regulations

Just in case liberals didn't already have enough reasons to pin EPA Administrator Scott Pruitt's picture to their dart boards, he's just rolled out another policy change which will force the "party of science" to rely on actual science when pushing for regulatory changes. Promising to eliminate "secret science" in EPA deliberations, Pruitt is ordering all scientific studies used when considering new regulations to include publicly available data and methodologies. This was announced in an exclusive interview with The Daily Caller News Foundation.

Detroit News: EPA chief wants to eradicate lead from drinking water

AMERICAN OVERSIGHT

The head of the Environmental Protection Agency says eradicating lead from drinking water is one of his top priorities three years after the Flint water crisis, and he's worried Americans aren't "sufficiently aware" of the threat. "I really believe that we ought to set a goal as a country that, over the next 10 years, that we ought to work with respect to investments in our infrastructure to eradicate lead in our drinking water," EPA Administrator Scott Pruitt told reporters this week at the agency's headquarters. "It can be achieved. Some of the mental-acuity levels of our children are being impacted adversely as a result of this." Pruitt is concerned that parents and citizens don't understand the threat of lead in drinking water or toys, and "we're looking at ways we can contribute to that dialogue," he said, according to an audio recording provided by the New York Post.

New York Post: EPA head calls for 'coordinated' response to NYC lead crisis

EPA Administrator Scott Pruitt called for a "coordinated" response between New York State and City officials to address the ongoing lead crisis. Asked whether federal intervention is needed to protect New York children and tenants from lead poisoning, the Environmental Protection Agency chief urged action on all fronts. "I think a local, state and federal response that is very coordinated and collaborative is terribly important," Pruitt said in an interview. "We each play a role. I'd love to see steps taken at the local level to invest." Gov. Cuomo already announced an emergency declaration for New York Housing Authority buildings and pledged an additional $250 million for upgrades. But heated public squabbles over resources and responsibility with rival Mayor de Blasio have complicated progress.

The Philadelphia Inquirer: Philly has a smog problem. Will Scott Pruitt's EPA say so?

Whether Philadelphia is violating the federal Clean Air Act remains in bureaucratic limbo. Despite deadlines, the EPA has refused to say whether Philadelphia and some other cities, including Pittsburgh, have met a 2015 benchmark of 70 parts per billion or less of ground-level ozone in the ambient atmosphere. Being out of compliance, or in "nonattainment," has a real-world impact on the state, city, businesses and industry, and even motorists through increased regulation and funding. The EPA was supposed to state whether Philadelphia was in compliance by last Oct. 1. Last week, a federal court ruled that the EPA, under its administrator, Scott Pruitt, broke the law by missing the deadline, and gave the EPA until April. On Monday, Pruitt's office said it would meet the deadline.

National Morning News Highlights 03.21.18

AMERICAN OVERSIGHT

Politico: Congress struggles to clinch spending deal

Congressional leaders are racing to finalize a spending bill by the end of Tuesday but find themselves still at odds over a host of controversial issues — delaying plans to unveil the proposal and raising the prospect of weekend votes to avoid a shutdown. Democrats, Republicans and the White House battled late into the night Monday and into Tuesday afternoon over whether to include provisions on President Donald Trump's border wall, a massive New York infrastructure project and the special counsel's Russia investigation, according to lawmakers and aides in both parties. There were still a number of unresolved issues as of Tuesday evening, and multiple sources were pessimistic that negotiators would reach a deal in time to release the bill before Wednesday.

Wall Street Journal: Trump to Ramp Up Trade Restraints on China

The White House is preparing to crack down on what it says are improper Chinese trade practices by making it significantly more difficult for Chinese firms to acquire advanced U.S. technology or invest in American companies, individuals involved in the planning said. The administration plans to release on Thursday a package of proposed punitive measures aimed at China that include tariffs on imports worth at least $30 billion. But the tariffs won't be imposed immediately. Rather, U.S. industry will be given an opportunity to comment on which products should be subject to the duties. As part of the package, the White House will announce possible investment restrictions by Chinese firms in the U.S. and will direct the Treasury Department to outline rules governing investment from China.

EPA Administrator Scott Pruitt says lack of clean up of Tar Creek Superfund site is 'unacceptable'

By: Jim Myers, 3/21/18

AMERICAN OVERSIGHT

Administrator Scott Pruitt of the U.S. Environmental Protection Agency said his new push on the nation's Superfund program finally can provide clarity and accountability to the Tar Creek area, for decades one of the oldest, largest and most complex toxic sites in the nation.

"It is really unacceptable," Pruitt said as he recalled the history of the Tar Creek area in far northeastern Oklahoma, whose Superfund legacy dates back to 1983, as well as the amount of money and time deployed there.

"You don't list a site in the mid-1980s and you don't take the kind of steps we have taken historically and still have issues today in 2018."

The area in Ottawa County is contaminated by lead and other heavy metals from long-closed mining operations and is undermined with caverns that are prone to cave-ins. The Picher and Cardin communities were bought out by a federal program and are now ghost towns, but the mine wastes remain.

Pruitt blamed inconsistency, even within the EPA's 10 regions, as well as a lack of attention and focus, for slowing remediation outcomes.

"It is one of the things that seemed to be languishing as we arrived," Pruitt said, making it clear that the lack of urgency was something he found "palpable" at Superfund sites across the country.

"When it takes you 27, 28 years to make a decision — make a decision, not clean it up, not remediate, but make a decision on how you are going to remediate — that is unacceptable."

His comments came during one of several reporter roundtables he has been holding at the EPA's headquarters to mark his first year as administrator, during which he also became a leading voice in the Trump administration's major push on regulation reform.

AMERICAN OVERSIGHT

Those efforts have prompted applause from his supporters and alarm from his critics.

Recently Pruitt is rarely out of the headlines, with stories ranging from travel expenses to speculation over whether his political future might include bids for a U.S. Senate seat or even the White House.

When given the chance to comment on yet another story this week about his political options, he took a pass.

Pruitt also declined to comment when asked about a recent decision by an Oklahoma judge to allow a lawsuit filed by Campaign for Accountability to continue. The lawsuit seeks to force the release of a 2014 audit of the Lead-Impacted Communities Relocation Trust, which was created in an effort to help move residents out of communities affected by the Tar Creek contamination.

"That is during my time as attorney general," he said. "I think it is better that I just keep it focused on the EPA matters."

Pruitt, who was Oklahoma's attorney general before being tapped by President Donald Trump to lead the EPA, had declined to file charges based on the audit by state Auditor Gary Jones and also had taken steps to bar its release to the public.

According to reporting by The Oklahoman, legal action in the case continues and eventually could include an appeal to the Oklahoma Supreme Court.

Pruitt's emphasis on Tar Creek and the other Superfund sites across the country grew out of a task force he created in 2017, just months after being sworn in as administrator.

Members of the Superfund Task Force came back with a list of specific recommendations under major goals ranging from expediting cleanup and remediation to promoting

AMERICAN OVERSIGHT

redevelopment and community revitalization.

As part of that process, Tar Creek landed on a list Pruitt says he will use to keep the emphasis on the program.

EPA Ends The Use Of "Secret Science" In Crafting Regulations

By: Jazz Shaw 3/20/18

Just in case liberals didn't already have enough reasons to pin EPA Administrator Scott Pruitt's picture to their dart boards, he's just rolled out another policy change which will force the "party of science" to rely on actual science when pushing for regulatory changes. Promising to eliminate "secret science" in EPA deliberations, Pruitt is ordering all scientific studies used when considering new regulations to include publicly available data and methodologies. This was announced in an exclusive interview with The Daily Caller News Foundation.

"We need to make sure their data and methodology are published as part of the record," Pruitt said in an exclusive interview with The Daily Caller News Foundation. "Otherwise, it's not transparent. It's not objectively measured, and that's important."

Pruitt will reverse long-standing EPA policy allowing regulators to rely on non-public scientific data in crafting rules. Such studies have been used to justify tens of billions of dollars worth of regulations.

EPA regulators would only be allowed to consider scientific studies that make their data available for public scrutiny under Pruitt's new policy. Also, EPA-funded studies would need to make all their data public.

AMERICAN OVERSIGHT

"When we do contract that science out, sometimes the findings are published; we make that part of our rule-making processes, but then we don't publish the methodology and data that went into those findings because the third party who did the study won't give it to us," Pruitt added.

In other words, science is not being excluded from any EPA studies. The agency is simply ensuring that groups conducting studies publish the data used to reach the conclusions they forward to the EPA so it can be examined and potentially challenged if it's found to be faulty. Surely nobody who's really interested in following the science could object to that, right?

Wrong. Democrats were immediately arguing against such a move, saying that forcing research organizations to publish their figures "would reveal confidential patient data." That's a rather odd argument in a couple of different ways. First of all, there's a lot of data collected for various studies used by the EPA which have nothing to do with medical records. Examples include all of the groundwater studies done when the Obama administration was considering banning fracking.

But even in cases where medical information is required, the groups conducting the study were able to obtain the patient data. As Steve Milloy, the publisher of JunkScience.com was quoted as saying, California regularly makes such data available under the name, 'Public Use Death Files.' Other medical information can be compiled and have the patients' names and other identifying personal information scrubbed. This is already done on a regular basis.

In fact, barring some subject which might compromise national security – such as the handling of tactical weapons materials – it's difficult to imagine many true, scientific studies which couldn't publish their underlying data, making it available for peer review. So if you're still opposed to federal agencies wanting to see such data, the next logical question to ask is precisely what it is that you're hiding.

The Detroit News

AMERICAN OVERSIGHT

EPA chief wants to eradicate lead from drinking water

By: Melissa Nann Burke, 3/20/18

The head of the Environmental Protection Agency says eradicating lead from drinking water is one of his top priorities three years after the Flint water crisis, and he's worried Americans aren't "sufficiently aware" of the threat.

"I really believe that we ought to set a goal as a country that, over the next 10 years, that we ought to work with respect to investments in our infrastructure to eradicate lead in our drinking water," EPA Administrator Scott Pruitt told reporters this week at the agency's headquarters.

"It can be achieved. Some of the mental-acuity levels of our children are being impacted adversely as a result of this."

Pruitt is concerned that parents and citizens don't understand the threat of lead in drinking water or toys, and "we're looking at ways we can contribute to that dialogue," he said, according to an audio recording provided by the New York Post.

"I do think that what happened in Flint is something that could happen elsewhere. We just simply need to take steps to do all that we can to address it prospectively and proactively," Pruitt said.

Pruitt said President Donald Trump's $1.5 trillion plan to bolster the nation's infrastructure over the next decade would include investments in aging water infrastructure.

AMERICAN OVERSIGHT

Pruitt didn't describe a plan for replacing the thousands of lead service lines throughout the country – a cost estimated around $40 billion to $45 billion – but stressed the need for state and local governments to invest in such upgrades, perhaps with federal grant aid.

Pruitt added he would "love" to see local governments investing more in water infrastructure.

"These water treatment facilities – they have authority to bond out, to raise fees, to invest in corrosion control, the replacement of service lines and the rest," Pruitt said. "And some of them just aren't doing it."

Gov. Rick Snyder has proposed having water customers across Michigan pay a $5 annual fee to help upgrade aging infrastructure and replace lead pipes in their local communities, but the plan hasn't gained steam in the Republican-controlled Legislature.

U.S. Rep. Dan Kildee, D-Flint Township, said what Pruitt has described isn't really a plan.

"When it comes to Mr. Pruitt, nice words don't replace pipes. It takes money. What they have proposed is really nothing when it comes to infrastructure," Kildee said of the Trump administration.

Kildee said what would help is Pruitt putting his support behind Kildee's legislation that would reduce the acceptable amount of lead in drinking water to 5 parts per billion. The current federal action limit is 15 parts per billion.

"Force federal and state governments to stare this in the face by adopting a level that is science-based that says there is no acceptable level of lead," he said.

EPA has spent a decade trying to update the rule.

AMERICAN OVERSIGHT

Snyder called the rule "dumb and dangerous" after the Flint disaster. The state has proposed draft rules to drop the acceptable amount of lead in drinking water to 10 parts per billion by 2024.

The New York Post

https://nypost.com/2018/03/21/epa-head-calls-for-coordinated-response-to-nyc-lead-crisis/

EPA head calls for 'coordinated' response to NYC lead crisis

By: Marisa Schultz, 3/21/18

EPA Administrator Scott Pruitt called for a "coordinated" response between New York State and City officials to address the ongoing lead crisis.

Asked whether federal intervention is needed to protect New York children and tenants from lead poisoning, the Environmental Protection Agency chief urged action on all fronts.

"I think a local, state and federal response that is very coordinated and collaborative is terribly important," Pruitt said in an interview. "We each play a role. I'd love to see steps taken at the local level to invest."

Gov. Cuomo already announced an emergency declaration for New York Housing Authority buildings and pledged an additional $250 million for upgrades. But heated public squabbles over resources and responsibility with rival Mayor de Blasio have complicated progress.

Pruitt declined to weigh in on the Cuomo/de Blasio feud but encouraged broad infrastructure investment from all levels to prevent children from getting sick.

AMERICAN OVERSIGHT

"I think the governor's call for that is important and it's something we think is important as well and we need to contribute to it along with the states, local cities and towns," Pruitt said.

While the problems in NYCHA are centered on lead paint, Pruitt has primarily tackled the issue of eliminating lead poisoning from water. He raised concerns over high lead levels found at certain New York City school water fountains.

"I do think that what happened in Flint is something that could happen elsewhere," Pruitt said. "We just simply need to take steps to do all that we can to address it prospectively and proactively."

Pruitt estimated it would take $40 billion – $45 billion to replace lead service lines nationwide and suggested President Trump's $1.5 trillion infrastructure plan can assist states and cities with the costs.

"I really believe that we ought to set a goal as a country that, over the next 10 years, that we ought to work with respect to investments in our infrastructure to eradicate lead in our drinking water," Pruitt said.

He added: "It can be achieved. Some of the mental-acuity levels of our children are being impacted adversely as a result of this."

The Philadelphia Inquirer

http://www.philly.com/philly/health/pruitt-epa-smog-philadelphia-ozone-20180320.html

Philly has a smog problem. Will Scott Pruitt's EPA say so?

By: Frank Kummer, 3/20/18

AMERICAN OVERSIGHT

Mollie Michel of South Philadelphia keeps her children inside some days because of air pollution, so she's particularly irked by a long delay by the U.S. Environmental Protection Agency to say officially whether Philadelphia has a smog problem. That designation could mean more regulation to help clean up the dirty air, she said.

"You have a city with a childhood asthma rate twice as high as the national average," Michel said to bolster her argument. A member of Moms Clean Air Force, she gathered Tuesday with a few dozen other activists and local officials at City Hall to mark the first day of spring by protesting Trump administration policies.

Whether Philadelphia is violating the federal Clean Air Act remains in bureaucratic limbo. Despite deadlines, the EPA has refused to say whether Philadelphia and some other cities, including Pittsburgh, have met a 2015 benchmark of 70 parts per billion or less of ground-level ozone in the ambient atmosphere. Being out of compliance, or in "nonattainment," has a real-world impact on the state, city, businesses and industry, and even motorists through increased regulation and funding.

The EPA was supposed to state whether Philadelphia was in compliance by last Oct. 1. Last week, a federal court ruled that the EPA, under its administrator, Scott Pruitt, broke the law by missing the deadline, and gave the EPA until April.

On Monday, Pruitt's office said it would meet the deadline.

Pruitt said during a meeting with reporters at EPA headquarters in Washington that the scope of monitoring required to answer the smog question had caused the delay.

"The agency has been running behind for a number of years," said Pruitt, who took office a year ago.

AMERICAN OVERSIGHT

Pruitt, who said he didn't have data specific to Philadelphia in front of him, also took issue with how the monitoring program has been carried out in the past, saving money by "modeling" — using data from one area and applying it to another.

"Real data is terribly important," Pruitt said. "When we go forward, we need to focus more on monitoring as opposed to modeling … You shouldn't get data from one monitor and extrapolate it over a whole area because you're not dealing with real data at that point."

He said his office is "exploring ways" to pay for monitoring.

If Philadelphia is declared to have a smog problem, the Pennsylvania Department of Environmental Protection would be responsible for crafting a plan to reduce ground-level ozone. Ozone is formed when volatile organic compounds and nitrogen oxides — created by burning fossil fuels, and power plants and other industries — combine in sunlight. Long, hot, humid days act as smog factories, so smog is expected to increase as the climate warms up.

James Garrow, a spokesman for the city's Department of Public Health, said, "Philadelphia is indeed out of compliance" as of March 1. He said the trend for ground-level ozone has been going down for years and Philadelphia expects to meet requirements within a few years.

At the protest, Flora Cardoni, an organizer with PennEnvironment, joined Democratic State Reps. James R. Roebuck Jr. and Brian K. Sims, as well as members of Deep Green Philly and the Clean Air Council, in speaking out. Cardoni said it's already been too long a wait for action.

"Philadelphians want to walk along the Schuylkill, play in Fairmount Park, and wander the historic city without worrying about choking on smog and soot," she said.

Congress struggles to clinch spending deal

By: Burgess Everett, Rachel Bade, Sarah Ferris and Heather Caygle, 3/20/18

Congressional leaders are racing to finalize a spending bill by the end of Tuesday but find themselves still at odds over a host of controversial issues — delaying plans to unveil the proposal and raising the prospect of weekend votes to avoid a shutdown.

Democrats, Republicans and the White House battled late into the night Monday and into Tuesday afternoon over whether to include provisions on President Donald Trump's border wall, a massive New York infrastructure project and the special counsel's Russia investigation, according to lawmakers and aides in both parties.

There were still a number of unresolved issues as of Tuesday evening, and multiple sources were pessimistic that negotiators would reach a deal in time to release the bill before Wednesday.

Asked how confident he was that the Senate would avoid weekend work, Sen. John Thune (R-S.D.) replied: "I'm not real confident at this point."

Dragging the talks into Wednesday would increase the chance that lawmakers pass a short-term spending bill to prevent a temporary shutdown when funding lapses Friday evening.

Several issues remain open after administration officials participated in a lengthy meeting Tuesday afternoon with top leadership and appropriations staffers that did little to break the logjam.

AMERICAN OVERSIGHT

“Everything that remains is going to be pulling teeth to resolve,” said a senior congressional aide with knowledge of the meeting, which included representatives from the White House and the Office of Management and Budget.

The New York-area Gateway project is a primary issue for the White House, according to the aide, but several other provisions are also still up in the air.

Trump is likely to support the bill if the Gateway project is excluded, the military receives a major budget boost and there is a significant infusion of border security funding, White House legislative affairs director Marc Short said at the Capitol Tuesday.

House Speaker Paul Ryan (R-Wis.) told his conference that he is planning to pass the massive, $1.3 trillion omnibus on Thursday, according to House Republicans.

"I'm hoping today," Ryan told reporters when asked Tuesday morning when leaders would wrap up negotiations. He said lawmakers were not yet considering a short-term funding patch to buy more negotiating time. "There are some unresolved issues. We're working through them as we speak."

Senate Majority Leader Mitch McConnell (R-Ky.) said he would keep the Senate in until the bill is passed.

"We anticipate the House filing later today, which will give the Senate plenty of time to take a look at it and see what’s in it," McConnell said on Tuesday afternoon.

Still, on the House's current schedule, the Senate would have just a day to pass the bill before government funding runs out on Friday evening — allowing for any one senator to shut the government down briefly. Sen. Rand Paul (R-Ky.) caused such a shutdown last month in protest over a budget deal.

AMERICAN OVERSIGHT

Paul would not rule out doing everything he can to stop the spending bill if he views it as poorly as he did a budget bill in February.

“I will oppose the bill. I have to make a decision about whether or I will accept a time agreement,” Paul told reporters on Tuesday.

Senate leaders are already entertaining a short-term spending bill in preparation for any antics by Paul.

"We're going to be here into the weekend, perhaps. But I think there could be some measures taken to keep the lights on. But we'll get it done," said Senate Majority Whip John Cornyn (R-Texas). "Anything can happen around here."

Congressional leaders had hoped to file the bill, which would fund the government through the end of September, on Monday night with a House vote on Wednesday. But Congress is bogged down over policy provisions that various congressional factions are trying to attach to the must-pass bill. Many lawmakers view the legislation as their last chance to get their priorities signed into law before the midterm elections.

“Negotiations continue between the four leaders. A few sticking points remain, but we are very close," said Senate Minority Leader Chuck Schumer (D-N.Y.). "I think it will be a fair compromise."

Lawmakers and aides estimated there were as many as 20 provisions still being debated. One of the most controversial is $900 million in funding for the Gateway tunnel project in New York, a key priority of Schumer and New York-area Republicans and Democrats.

Gateway supporters are trying to include language that would allow the project to apply for competitive grant money and prevent the Trump administration from squashing the project. Trump has told Republicans he will veto a bill that funds the project specifically. Schumer and GOP leaders were still battling over the provision as of Tuesday afternoon, and the New Yorker said the tunnel is of national significance despite Trump's complaints.

AMERICAN OVERSIGHT

The White House remains unmoved, however.

“The secretary of transportation has explained if you put that much money in one project it’s going to crimp projects across the country she needs to fund. It‘s also a project that a majority of House Republicans… voted against," Short said. “The president has made his wishes well known so I think we’re going to be fine."

Another sticking point: immigration. Talks to protect young immigrants facing deportation fell apart over the weekend, but congressional Democrats spent Monday and Tuesday pushing to freeze hiring of immigration enforcement officials in return for providing Trump more than $1 billion in funding on his border wall.

Democrats and Republicans are likely to agree on about $1.6 billion in border funding that would help finance some fencing and security and avoid directly funding the large concrete wall that Trump wants, according to a Democratic aide.

Republicans are seeking to fix an error in the new tax law that lowers tax bills for farmers that sell grain to cooperatives at the expense of other companies. Though Senate Democrats and some Senate Republicans are willing to rewrite the provision in exchange for a boost in Low-Income Housing Tax Credits in the spending bill, Ryan has resisted, according to people in both parties. Ryan allies say that just because he rejected an offer from Schumer to fix

the so-called “grain glitch,” it doesn't mean the issue is dead altogether.

Congressional Democrats also pushed provisions to protect special counsel Robert Mueller but have been rebuffed by GOP leaders. An attempt to shore up Obamacare's insurance markets is also stalled in a battle over abortion.

Lawmakers believe neither of those provisions will be in the omnibus.

AMERICAN OVERSIGHT

A Tuesday morning school shooting in Maryland, however, may have thrown another wild card into the mix: GOP leaders are pressing to include popular legislation that would improve the National Instant Criminal Background Check System for firearms purchases.

“We remain hopeful that Fix NICS is in the omni," Short said of the proposal to improve the FBI’s background check system.

But Democrats want a broader gun debate and note that the provision is a modest way to simply bolster existing gun laws. Meanwhile, conservatives believe it would make it more difficult for some veterans to buy a gun, which could keep that provision out as well.

"There are still some key questions. There's a NICS question, there's an Internet sales tax question, there‘s [an Obamacare] question. There's a Gateway project financing question," said Rep. Jim Jordan (R-Ohio), a conservative leader. "It looks like a lot of those things aren't gonna be in it, which is a good step, but it still spends way too much money."

The Wall Street Journal

https://www.wsj.com/articles/trump-to-ramp-up-trade-restraints-on-china-1521593091

Trump to Ramp Up Trade Restraints on China

By: Bob Davis, 3/20/18

The White House is preparing to crack down on what it says are improper Chinese trade practices by making it significantly more difficult for Chinese firms to acquire advanced U.S. technology or invest in American companies, individuals involved in the planning said.

The administration plans to release on Thursday a package of proposed punitive measures

AMERICAN OVERSIGHT

aimed at China that include tariffs on imports worth at least $30 billion.

But the tariffs won't be imposed immediately. Rather, U.S. industry will be given an opportunity to comment on which products should be subject to the duties. As part of the package, the White House will announce possible investment restrictions by Chinese firms in the U.S. and will direct the Treasury Department to outline rules governing investment from China.

Final details of the plan, including the amount of imports to be hit by tariffs, remain in flux, those involved with the discussions said. While the rough amount and rationale for the tariffs are expected to be disclosed on Thursday, the final decisions will come once U.S. industry has had its say, they said.

A White House spokeswoman declined to comment.

The effort stems from a monthslong investigation by the administration into Chinese intellectual property practices that found the damage to U.S. companies from forced technology transfer is $30 billion annually.

The administration has warned Beijing that it risked tariffs if it didn't significantly liberalize its market and eliminate practices that disadvantage foreign firms.

While the administration's plans to put tariffs on China have received most of the attention, it is considering other significant penalties, especially those aimed at state-owned Chinese firms. It plans to argue that Chinese state-owned firms buy U.S. technology not for commercial purposes, but to apply for military use and otherwise gain an edge in the race for global technological dominance.

The administration believes that Beijing, in requiring U.S. companies to form joint ventures to do business in China, then pressures them to transfer important technology to their Chinese partners. The U.S. also contends Beijing improperly subsidizes Chinese companies looking to overtake U.S. rivals in such advanced technologies as semiconductors, artificial

AMERICAN OVERSIGHT

intelligence and robotics.

Chinese officials have said that they are improving their protection of intellectual property and liberalizing their economy. They also complain that the U.S. hasn't given them a specific list of demands that they need to meet to head off tariffs.

The country's responses to challenges from President Donald Trump loomed large as China's leaders closed out an annual political gathering on Tuesday.

Premier Li Keqiang, the titular No. 2 leader, struck a conciliatory tone on trade with the U.S. At a news briefing in Beijing's Great Hall of the People, Mr. Li said "there are no winners" in a trade war between the world's two largest economies, and appealed for calm.

People involved in the planning say the Trump administration is looking at making reciprocity the core of U.S. investment relations with China, meaning that the U.S. would impose restrictions on Chinese investment similar to those that U.S. firms face in China. That could mean that the U.S. would insist that Chinese firms form joint ventures before doing business in the U.S., unless China dropped those restrictions.

The U.S. has already made it more difficult for Chinese companies to invest in the U.S. by blocking Chinese bids to purchase U.S. semiconductor firms. That is done by an interagency review of foreign acquisitions by the Committee on Foreign Investment in the U.S. Congress is looking to broaden CFIUS reviews of acquisitions so they include joint ventures too.

The expansion would include reviews of technology transfers to foreigners and could apply to joint ventures both outside and within the U.S. But CFIUS looks solely at national security concerns. The administration wants to address economic harm as well, according to these people.

Any imposition of tariffs, without going first to the World Trade Organization, is sure to prompt a chorus of criticism not just from Beijing but from U.S. industry, which has

AMERICAN OVERSIGHT

opposed tariffs as counterproductive. The WTO adjudicates trade cases and has the power to authorize tariffs in cases where a losing party doesn't change its practices. The administration is also considering bringing a case against Chinese trade practices that are covered by the WTO.

Oregon Sen. Ron Wyden, the senior Democrat on the Senate Finance Committee, said he opposes the broad imposition of tariffs. "American producers who haven't gotten a fair shake in the past aren't going to get that back by just have tariffs slapped on imports indiscriminately," he said.

Tariffs are bound to cause China to retaliate, said Clement Leung, Hong Kong's representative in the U.S. Chinese officials "cannot show any weakness" at a time when the country's leader, Xi Jinping, has just been confirmed for his second term, Mr. Leung said. Hong Kong, a trading center that operates somewhat independently from the rest of China, would be hurt by limits on trade.

Whatever the political blowback, Harvard law professor Mark Wu, a trade expert, says that the White House has authority to impose tariffs under section 301 of the Trade Act of 1974.

"In situations where the U.S. Trade Representative deems unfair trade practices to fall outside the scope of a WTO-covered agreement, then the statute permits the executive branch to take action directly without first seeking recourse through WTO dispute settlement" procedures, he said.

Frustration with Chinese trade practices has been building among both the governments and private sectors of the U.S., Japan and Europe. One reason the U.S. is considering a separate WTO case is to try to recruit allies to pressure China. But any move to impose tariffs could allow Beijing to portray itself as a victim. Coalition-building has become more complicated in the wake of a separate U.S. action to levy tariffs on steel and aluminum imports from allied nations.

For instance, finance ministers and central bankers from the Group of 20 countries, meeting

AMERICAN OVERSIGHT

in Buenos Aires on Tuesday, failed to reach any new agreement on shared principles when it comes to trade policies, as the split between the U.S. and other major economies deepened over the U.S.'s tariff policies.

The administration is considering recommendations from two other reports that would impose draconian investment restrictions on China. The U.S.-China Economic and Security Review Commission, a Congressional panel that takes a hard line on China, last year urged the administration to prohibit "the acquisition of U.S. assets by Chinese state-owned or state-controlled entities, including sovereign wealth funds."

A report for the Pentagon by its Defense Innovation Unit Experimental, which examines technology issues, has recommended that the Pentagon pursue a policy of "deterring Chinese technology transfer" by broadening CFIUS's mandate and strengthening export controls on technology to China.

China Investment Corp, Chinese sovereign-wealth fund which could get hit by sanctions, is putting together a fund targeting as much as $5 billion with Goldman Sachs Group Inc., aimed at investing in U.S. manufacturing and other sectors. CIC hopes the fund would pass muster with U.S. regulators, say those people familiar with the plans.

It is unclear how far the administration will go in pursuing these ideas. Blocking the acquisition of all purchases by Chinese state firms, for instance, would mean that Chinese state-owned airlines couldn't buy Boeing jets. Toughening export controls on, say, semiconductor production machinery could cede the market to Japanese vendors.

The administration's actions on China come on the heels of plans to levy tariffs on steel and aluminum imports. Japan, Korea and the European Union are scrambling to get exemptions from those levies, which are set to go into effect on Friday.

House Democrats ask EPA chief for details on premium travel

By Valerie Volcovici, 2/20/18, 1:01 PM

WASHINGTON (Reuters) - Democrats on the House energy committee on Tuesday asked Environmental Protection Agency chief Scott Pruitt to explain travel records that recently came

AMERICAN OVERSIGHT

to light, which showed he has taken frequent first-class flights at taxpayer expense.

The Democrats wrote a letter asking Pruitt to provide a list of all dates where he traveled in first or business class, an explanation on how he followed guidelines for obtaining waivers for premium travel and the names of other staff who also traveled in premium class.

Complaints about travel arrangements by Pruitt and other Trump administration cabinet members re-emerged last week. Last year, Health and Human Services Secretary Tom Price resigned after reports that he used private jets for routine travel.

The documents cited by the lawmakers showed that Pruitt's official travel has included first class flights for him and key staff, as well as the use of charter flights.

Pruitt did not immediately reply to a request for comment on the letter from members of the House panel. He recently said in a television interview that he was instructed to travel first class due to security threats and "uncomfortable" confrontations with other passengers.

The letter from the lawmakers asked Pruitt to explain why he believes security threats are reduced in first class cabins.

On Feb. 18, the Washington Post reported that Pruitt canceled a planned weeklong trip to Israel. A few days earlier, the newspaper had reported that he spent over $100,000 in taxpayer money for premium travel, based on records obtained by the Environmental Integrity Project.

That watchdog group on Friday obtained new travel records, shared with media, showing Pruitt and EPA employees spent upwards of $150,000 on premium commercial and chartered flights from March to August 2017.

"Americans deserve an EPA Administrator more dedicated to first class protection of human health and the environment than to luxury travel at taxpayer expense," the letter said.

AMERICAN OVERSIGHT

The letter also questioned a claim by EPA spokesman Jahan Wilcox, who told reporters Pruitt received a "blanket waiver" by ethics officials to enable him to travel first class.

The committee Democratic leaders, Representatives Frank Pallone, Paul Tonko and Diana DeGette, asked for answers by March 6.

Politico

https://www.politicopro.com/agriculture/whiteboard/2018/02/house-democrats-press-pruitt-for-more-info-on-travel-646305

House Democrats press Pruitt for more info on travel

By Eric Wolff, 2/20/18, 12:09 PM

Democrats on the House Energy and Commerce Committee are pressing EPA Administrator Scott Pruitt to clear up the "shifting explanations" around his reasons for flying first class.

Reps. Frank Pallone (N.J.), Diana DeGette (Colo.) and Paul Tonko (N.Y.), the top Democrats on the full committee, the oversight subcommittee and the environment subcommittee, sent Pruitt a letter today asking for details on the security justifications and who is involved in booking his first-class plane tickets.

"The Agency has offered shifting explanations to date regarding whether or not you have complied with federal regulations and Agency policies and procedures, raising significant questions about the veracity of information provided by your office," the letter says.

AMERICAN OVERSIGHT

Pruitt has flown first class extensively in the past year and has received an unusual number of security threats. Last week, the agency told POLITICO that it had a "blanket waiver" for Pruitt's pricey travel, but backtracked after POLITICO cited EPA regulations barring such a waiver.

Pruitt has received more threats than his predecessors, EPA has said, and faced confrontations in airports when he has traveled.

The same group of Democrats wrote last week to EPA Inspector General Arthur Elkins asking him to expand his probe of Pruitt's travel.

E&E Greenwire

https://www.eenews.net/greenwire/stories/1060074395/search?keyword=EPA

House watchdog questions Pruitt's first-class travel

By Kevin Bogardus, 2/21/18

The House's top watchdog is requesting justification for U.S. EPA Administrator Scott Pruitt's first-class travel.

House Oversight and Government Reform Chairman Trey Gowdy (R-S.C.) sent a letter yesterday to the EPA chief asking for records that back up the agency's claims that Pruitt has taken the pricier business- and first-class trips over security concerns as well as a full accounting of every trip the administrator has taken during his first year at EPA.

AMERICAN OVERSIGHT

Gowdy asked for the documents "to assist the committee's oversight of whether federal regulations regarding official travel were followed." The chairman also took issue with an EPA spokesman's statement last week that Pruitt had a "blanket waiver" to fly first class due to security threats, which was later amended to say the administrator seeks an individual waiver for each flight (E&E Daily, Feb. 15).

"Clearly, federal regulations prohibit a blanket waiver to fly first class except to accommodate disabilities or special needs. Instead, a waiver for each flight is required in order to fly first or business class when traveling on official government business," Gowdy said.

The Republican asked that Pruitt identify each flight he has taken for official business from Feb. 17, 2017, to Feb. 16 of this year, including the cost of each flight and whether it was coach, business or first class.

In addition, Gowdy asked for any waivers given to Pruitt for the more expensive flights and for him to identify all other EPA employees and security guards who traveled with him and the cost of their airfare.

The Oversight chairman asked that Pruitt respond to his request no later than March 6.

Asked about Gowdy's letter, an EPA spokeswoman told E&E News, "We will respond through the proper channels."

Pruitt's travel over the past year, including his use of first-class flights as well as charter and military planes, has come under scrutiny from lawmakers and environmental groups. The EPA inspector general has an ongoing audit of the administrator's trips, which it has expanded twice to cover all of Pruitt's travel through the end of 2017.

AMERICAN OVERSIGHT

CNN

http://www.cnn.com/2018/02/18/politics/epa-scott-pruitt-israel-travel/index.html

Pruitt postponing visit to Israel after reports of expensive travel

By Eli Watkins, 2/18/18, 1:48 PM

Washington (CNN) - Environmental Protection Agency chief Scott Pruitt has postponed a planned visit to Israel following criticism for taking expensive flights on the taxpayer dollar, an EPA spokesperson confirmed to CNN.

"We decided to postpone," EPA public affairs officer Liz Bowman said in an email. "The administrator looks forward to going in the future."

The Washington Post was first to report news of the postponement, and people in Israel briefed on Pruitt's plans told the Post he would have arrived Sunday and stayed at a five-star hotel in Jerusalem through Thursday.

The Post said an EPA official previously said Pruitt would visit Israel to tour the nation and "gain an understanding of Israel's unique infrastructure and environmental challenges."

Pruitt has faced criticism for taking expensive flights and staying at luxury hotels more often than his predecessors, but has pushed back on accusations of improper or wasteful spending.

"We've reached the point where there's not much civility in the marketplace," Pruitt said. "And it's created, you know, it's created some issues and the (security) detail, the level of protection is determined by the level of threat."

He said he did not make the decision around his security and travel, and EPA documents have

AMERICAN OVERSIGHT

outlined details of some of his travel.

Scrutiny over Pruitt's travel has built for months, making him one of several Trump administration Cabinet officials under fire for their travel practices. Tom Price resigned last year as secretary of the Department of Health and Human Services after reports emerged about his extensive use of government-funded private jets.

The Hill

http://thehill.com/homenews/administration/374715-white-house-trump-has-confidence-in-va-epa-chiefs

White House: Trump has confidence in VA, EPA chiefs

By Jordan Fabian, 2/20/18, 3:53 PM

The White House indicated Tuesday that President Trump has confidence in his Veterans Affairs secretary and Environmental Protection Agency director despite allegations of travel abuses.

“I have no reason to believe otherwise," White House press secretary Sarah Huckabee Sanders told reporters when asked if Trump still has confidence in VA Secretary David Shulkin and EPA Administrator Scott Pruitt.

"As we have said many times before, if somebody doesn’t have the confidence of the president, you will know.”

AMERICAN OVERSIGHT

An inspector general report found that Shulkin improperly used taxpayer dollars for a trip to Europe last year and Pruitt has come under scrutiny for flying first-class while on official business.

Politico

https://www.politicopro.com/energy/article/2018/02/pruitts-cleanup-plan-wont-win-superfund-tax-infusion-353771

Pruitt's cleanup plan won't win Superfund tax infusion

By Alex Guillen and Anthony Adragna, 2/20/18, 4:33 PM

Congress revived a tax on crude to help pay for oil spill cleanups, and President Donald Trump has kept the door open for a 25-cent increase in the gas tax to fund infrastructure projects.

But there's little chance Congress will try to resurrect a long-dead Superfund tax on oil and chemical companies to help pay for EPA Administrator Scott Pruitt's push to shrink the backlog of thousands of polluted properties around the country.

Pruitt has pledged to speed the cleanup of the nation's worst Superfund sites, but he has never raised the idea of reviving the tax that was killed in 1995 after the "Gingrich revolution" the previous year gave the GOP control of the House. And though some Democrats and green groups continue to tout the tax, Republican lawmakers aren't worried that Pruitt's Superfund cleanups will suffer.

"I don't think we have enough time to say whether the direction [EPA is] going now is good or bad or needs to change," Rep. John Shimkus (R-Ill.), chairman of the Energy and Commerce Environment Subcommittee, told POLITICO. "I think he's making a good-faith effort to do it with the resources he has."

AMERICAN OVERSIGHT

The Superfund tax killed in the 1990s had three main revenue streams that generated $1.5 billion annually: 9.7 cents per barrel of crude oil produced or imported; a tax on certain chemicals and metals that went as high as $4.87 per ton depending on the substance; and a 0.12 percent tax on corporate profits exceeding $2 million.

By 2002, the Superfund had run dry, forcing Congress to tap into the government's general fund for its annual budgets. Under the Obama administration, Congress approved an average of $1.17 billion each year for Superfund cleanups. The Trump White House's proposed 2019 budget originally allocated just $762 million, although a last-second spending cap boost passed by Congress brought the proposed Superfund levels back up to $1.09 billion, on par with the previous couple of years.

Republicans are wary of imposing any new tax burdens, and many said they weren't familiar enough with the lapsed excise tax to evaluate it. And they said the revived oil spill tax, which imposes a 9-cent-per-barrel tax on oil that goes into the Oil Spill Liability Trust Fund, was not a good comparison.

"The Oil Spill Liability Trust Fund is so specific in its purpose," Senate Energy and Natural Resources Chairwoman Lisa Murkowski (R-Alaska) told POLITICO. "I haven't given thought to [the Superfund tax] and why this would be the right approach."

Others suggested the Superfund tax warranted further study.

"I don't know how much of a [funding] deficit exists in the Superfund sites," Sen. Dan Sullivan (R-Alaska) told POLITICO. "I certainly would look into it."

Democrats have argued the Superfund needs a dedicated funding stream outside of annual appropriations to pay for cleaning up hundreds of contaminated sites, and restoring the lapsed tax would show the administration's commitment to addressing the problem.

AMERICAN OVERSIGHT

“I do think there would be an opportunity for Congress to empower the resources to deal more effectively with brownfield sites and Superfund sites that have been identified,” Sen. Ben Cardin (D-Md.) said.

If EPA can identify the culprit behind a site, known as a “potentially responsible party,” it can force them to pay for cleanups, which happens at around 70 percent of sites.

The Trump administration has not proposed reviving the tax, and an EPA spokesman said that Pruitt "will continue to work with the funding provided by Congress to expedite remedies at all sites listed on the National Priorities List."

Pruitt has said that private money should be responsible for remediation, and he has downplayed the need for federal money, telling "Fox & Friends" last year "it's not a matter of money, it's a matter of leadership and attitude ad management."

Earlier this month, EPA proposed requiring subsidiaries of Republic Services and Exelon to foot part of the $236 million bill for a cleanup of radioactive waste at a St. Louis landfill. And last fall, EPA approved a $115 million plan to remove most of the dioxins at the submerged San Jacinto waste pits near Houston, though that decision is being opposed by the Waste Management.

But nearly one-third of the time, Superfund sites are known as “orphans,” with no clear responsible party. In those cases, the taxpayers are on the hook.

Some green groups say the responsibility for those 314 orphaned sites sites should fall on the overall polluting industry — the way the Superfund tax was funded.

“The whole idea of Superfund is responsible parties pay. If there’s an orphaned site, shouldn’t the industries likely to have caused the problem pay rather than the regular taxpayer?” said Scott Slesinger, legislative director for the Natural Resources Defense Council.

AMERICAN OVERSIGHT

Former President Barack Obama campaigned on reinstating the Superfund tax, and his budget proposals placed 10-year revenues at $23.5 billion, though it was never implemented. EPA even took the unusual step in 2010 of sending a letter to Congress urging them to reinstate it.

Sen. Bob Menendez and Rep. Frank Pallone of New Jersey — which is home to more Superfund sites than any other state — have repeatedly pushed legislation to revive the tax over the years to no avail. At a January Energy and Commerce Committee hearing, Pallone lamented the inaction on reinstituting the tax, saying "many endangered communities are being ignored, even as Administrator Pruitt declares the Superfund to be his top priority."

Industry groups oppose reviving the tax, and the American Petroleum Institute argues that the oil industry paid an outsize share into the original Superfund compared with its share of Superfund sites.

A 2008 Congressional Research Service report said that of the nearly $9.2 billion that went into Superfund in the five years before the tax expired, more than 25 percent came from the petroleum tax, while 12 percent came from the chemical tax. The corporate tax contributed 28 percent. The remaining 35 percent came from congressional appropriations, reimbursements from polluters and interest generated by the trust fund.

Congress could consider tweaking the formula to include other industries, but the funding burden should remain on the polluters, not the taxpayers, said Mathy Stanislaus, the former EPA assistant administrator who oversaw the Superfund program under Obama.

"The bottom line question is whether Congress and this administration are going to make the decision of whether the taxpayers pay for the mismanagement of worst actors in whatever sector, or should it be the various sectors that are most associated with creating products that can be associated to Superfund sites?" Stanislaus said. "Congress … has chosen to have the taxpayers pay versus those manufacturers."

Stanislaus also noted that the Trump administration in December reversed an Obama-era proposal under the Superfund law that would have required companies that mine gold, copper,

AMERICAN OVERSIGHT

iron and other "hardrock" minerals to obtain financial assurance that they could clean up sites once done.

Pruitt, Zinke and Perry to address CPAC

By Kevin Bogardus, 2/20/18

Cabinet members versed in energy and the environment will appear this week at the Conservative Political Action Conference in National Harbor, Md.

Energy Secretary Rick Perry, Interior Secretary Ryan Zinke and U.S. EPA Administrator Scott Pruitt are listed on the annual politically right-leaning event's agenda for this week.

Pruitt is scheduled to speak at the Ronald Reagan Dinner on Friday night. He is slated to appear alongside Fox News host Judge Jeanine Pirro at the ticketed event.

Friday morning, Perry and Zinke are expected to appear together. The two Cabinet secretaries will be interviewed by former Rep. Bob Beauprez (R-Colo.).

All three have appeared at CPAC in the past, including during their earlier posts as elected officials.

AMERICAN OVERSIGHT

One of Pruitt's first public events as EPA chief was his appearance at CPAC last year, where he promised an "aggressive" rollback of agency regulations (Climatewire, Feb. 27, 2017).

Pruitt's office cancels 'active shooter' drill

By Kevin Bogardus, 2/21/18

U.S. EPA Administrator Scott Pruitt's office has canceled an "active shooter" drill that had been scheduled at agency headquarters this afternoon.

Internal emails obtained by E&E News show EPA had planned and then backed off from holding the drill at the direction of Pruitt's office. EPA is now looking to reschedule the exercise.

"Hello, please be advised that the William Jefferson Clinton North Active Shooter Response Drill (ASRD) scheduled for tomorrow has been canceled at the direction of the Administrator's Office," said the email sent to employees yesterday.

"We appreciate the support from HQ staff and EPA law enforcement in planning for this drill. We are evaluating alternate dates and locations for scheduling another occupant-focused ASRD for EPA Headquarters in the near future."

EPA press officials didn't respond to questions about why the administrator's office canceled today's active shooter drill.

AMERICAN OVERSIGHT

The drill was to be conducted at 3 p.m. on the fifth floor of the William Jefferson Clinton North Building, according to another email sent yesterday morning before it was canceled.

The drill's beginning and end would have been announced over EPA's public address system, and participants would have practiced their "run, hide, fight" training from the Department of Homeland Security in responding to a gunman on the loose. Law enforcement was also expected to be present for the drill.

"Loud noises associated with the drill, including simulated gunfire and shouting may be heard as part of the drill. Please avoid the area if you are not a participant," the email said.

EPA's cancellation of its active shooter drill comes as the country wrestles with the tragic aftermath of another mass shooting. Last week, 17 people, including students, were killed in a shooting at a Parkland, Fla., high school.

EPA also had its own recent scare with an active shooter, although reports of gunshots at the agency's headquarters turned out to be false.

This past August, several employees at EPA headquarters sheltered in place and police rushed to the scene when one worker called 911 after hearing what were thought to be gunshots, later suspected to be the sound of a door slamming shut. Agency officials vowed to learn from the incident while acknowledging it was upsetting for some employees (E&E News PM, Aug. 22, 2017).

Obama EPA chief: Trump regulation rollbacks won't hold up legally

By Miranda Green, 2/20/18, 11:56 AM

Former EPA Administrator Gina McCarthy says that regulations struck down by the Trump administration simply because they were issued under President Obama won't carry weight in court.

McCarthy, who led the Environmental Protection Agency from 2013 to 2017, called the recent political targeting of regulations at the agency a "real problem."

"I think the important thing is none of them should be touched unless the administration has a real reason to touch them, other than it was done under the Obama administration, and that is the real problem that we see," McCarthy on Tuesday told BuzzFeed's morning livestream program, "AM to DM."

The former administrator, who has been an outspoken opponent of changes made under current EPA head Scott Pruitt, specifically mentioned the administration's desire to change the Clean Water Rule, also known as the Waters of the United States rule.

"We see the Clean Water Rule being proposed to be repealed, all that rule really did was do what the Supreme Court and what science told us to do to make sure we are protecting the rivers and streams that are necessary to ensure safe drinking water and fishable and swimmable waters," McCarthy said.

"That is being challenged just because the president told them to do that in an executive order. That's legally not going to hold up."

President Trump had made it a campaign trail promise to repeal the controversial 2015 Clean

AMERICAN OVERSIGHT

Water Rule. He signed an executive order in February 2017 formally asking Pruitt to consider repealing the rule and replacing it with a more limited one.

Last June, the EPA made its first steps to repeal the Clean Water Rule, and last month Pruitt formally suspended the Obama-era rule for two years while the administration works on a replacement draft rule.

McCarthy also touched on another hot point in environmental regulations, the Clean Power Plan, which she called one of the Obama administration's "premiere" steps.

Under Obama, the rule was met with many hurdles and has yet to be implemented. Prior to Trump taking office, the rule was awaiting final word from a federal appeals court.

Repealing the plan was part of Trump's promise to eradicate Obama's environmental legacy.

In October, the EPA formally announced plans to scrap the Obama administration's signature climate change rule for power plants. Pruitt signed the plan saying the rule exceeds the agency's authority under the Clean Air Act.

"I don't understand the reason why they'd want to delay decision in the DC Circuit over that, that are charging the legality of the rule," McCarthy said of the EPA's delay tactic. "Let them play out. Let us see whether we did it right. I think we did and I think they will hold up under court even if this administration wants them to go away."

When asked about recent news that Administrator Pruitt flies all work-related trips in either business or first class, frequently racking up thousands of dollars in tax-payer expenses, McCarthy said she always flew coach.

"It was comfy for the people in my family, it's comfy for me and the people that I serve," she said. "It's perfectly appropriate and that's how we travelled because our job was to make sure we

AMERICAN OVERSIGHT

were protecting public dollars as best we could and making sure that every public dollar we could was being spent on the real mission of the agency, not the luxury of the administrator who was leading it."

'I never imagined this would happen' — ex-EPA staffer

By Niina Heikkinen, 2/21/18

Former U.S. EPA staff members who worked on the Clean Power Plan are urging the Trump administration to back off its plans to kill the rule.

In public comments submitted yesterday, a volunteer group of retired and former agency staff called Save EPA said it should be up to a federal appeals court — not the Trump administration — to decide whether the Obama administration's signature climate regulation should proceed as originally written. The group includes ex-EPA staffers who helped craft that rule.

EPA is currently seeking comments on its proposed repeal of the Clean Power Plan. The agency is also in the process of developing a plan for a rule replacement.

Save EPA billed the repeal process as "an enormous waste of time," given that the U.S. Court of Appeals for the District of Columbia Circuit has already been fully briefed and heard legal arguments on the case in September 2016. The case has been on ice since, at the request of EPA, to allow the agency the opportunity to review the rule.

AMERICAN OVERSIGHT

Save EPA's comments come as the agency prepares to host its second listening session today on repealing the rule. Today's session is slated for Kansas City, Mo., and another is planned for next Wednesday in San Francisco.

"We urge the EPA to halt this repeal action, to obtain a court decision in the CPP litigation and if the rule is upheld based on the strong legal arguments presented in court, to implement the CPP without further delay," the commenters wrote.

The Obama administration's rule faced fierce legal pushback for setting systemwide rather than facility-level regulations on carbon emissions. The current EPA administrator, Scott Pruitt, was among a cadre of state attorneys general to file lawsuits against implementation of the rule. The agency under Pruitt's leadership is widely expected to rewrite the regulations to focus on controlling emissions at the power plant level.

Today's listening session will focus on the prospect of repealing the rule and will mainly feature speakers from environmental and public health groups such as the Natural Resources Defense Council, the Sierra Club, GreenLatinos, Citizens' Climate Lobby, the American Lung Association and Moms Clean Air Force. Save EPA is planning on sending a representative to the fourth and final listening session in Gillette, Wyo., next month.

The Federal Register currently has over 17,000 public comments on the proposal, many of them also critical of a repeal.

Save EPA members slammed EPA for not adequately taking into account the impacts of climate change on the American public. They argue the Clean Power Plan as it was first written was an "appropriate way" to limit carbon emissions, considering the interconnectedness of the country's electricity system. They noted the agency's revised cost-benefit analysis significantly underestimated the costs associated with a warming planet. According to the agency's 2015 analysis, the rule would yield between $31 billion and $54 billion in benefits, and $5.1 billion to $8.4 billion in costs once the rule was fully implemented in 2030.

"They are taking away tools the EPA administrator would have to reduce emissions substantially. The tack they are taking legally means it will be possible only to get a small fraction of the emissions reductions from a new replacement rule than could be gotten from the

AMERICAN OVERSIGHT

CPP. That's not the kind of position I'd hope an EPA administrator would take," said Jim Ketcham-Colwill, former EPA air policy analyst who helped to write the Clean Power Plan.

While Save EPA has focused on the negative impacts of allowing greater carbon emissions, other critics of the Clean Power Plan repeal have focused on how the rule could have helped to create renewable energy jobs if states chose to reduce their carbon emissions under the plan by turning to other energy sources.

Ashok Gupta, the senior energy economist at NRDC, wrote in a recent blog post that Midwest utilities are increasingly interested in cheap wind energy.

"In the Midwest, the trend is clear; the transition to clean energy is underway and will only intensify in the future. Having a strong national strategy to cut carbon pollution that provides states the flexibility to implement their own plans based on their resources is our best chance at fighting climate change and creating a path towards cleaner, cheaper and more reliable energy," Gupta wrote.

Ketcham-Colwill noted EPA had given a wide range of groups, including state energy regulatory agencies and governors' offices, ample opportunity to offer input on the climate rule.

"The agency got all kinds of plaudits that this was the most extensive stakeholder outreach process that the agency has perhaps ever done," said Ketcham-Colwill.

Ellen Kurlansky, another former air policy analyst at EPA who helped develop the Obama-era rule, said that in addition to public hearing and comments, a range of groups were involved in developing the rule from the very early stages until it was being finalized.

"People often want to talk to us and tell us what they think. We really had an open door," she said.

AMERICAN OVERSIGHT

Kurlansky warned that delaying carbon emission reductions from power plants could have serious implications for rural and low-income Americans most impacted by climate change. For example, changing weather patterns, temperatures and season length can affect which crops are viable in specific parts of the country. Isolated communities could have a hard time getting aid in the event of climate-driven severe weather.

Meanwhile, low-income communities are often least able to financially prepare for or recover from environmental disasters. Many live in closer proximity to power plants and bear a higher brunt of the public health impacts. Indigenous communities also suffer from the loss of traditional cultural practices.

Kurlansky said she had not considered the prospect of a future administration seeking to undo the rule while she was working on it.

"I never imagined this would happen, it's really sad to see," she said.

Justices pass on challenges to EPA's Clean Water Act power

By Amanda Reilly, 2/20/18

The Supreme Court won't revive a pair of lawsuits challenging U.S. EPA's authority under the Clean Water Act. Justices today passed on taking up cases related to stormwater policies and permits for water reclamation plants.

AMERICAN OVERSIGHT

As with a recent litigation over the Obama-era Clean Water Rule, the Supreme Court petitions centered on the correct legal venue to bring lawsuits. In both instances, a lower court tossed out the suit after finding it did not have jurisdiction.

At issue in the stormwater case were EPA policies guiding whether cities may dilute stormwater before discharging it into rivers and streams, and the treatment of wastewater during heavy rains.

The 8th U.S. Circuit Court of Appeals in 2013 found EPA illegally created rules in letters to Sen. Chuck Grassley (R-Iowa), instead of going through the formal rulemaking process.

EPA, though, continued to apply the policies on a case-by-case basis everywhere but the 8th Circuit, which runs down the center of the country from North Dakota to Arkansas.

The Center for Regulatory Reasonableness, which represents municipalities and industrial entities, filed suit in the U.S. Court of Appeals for the District of Columbia Circuit to halt the disputed policies nationwide.

The group specifically challenged a pair of 2014 letters to industry associations in which EPA conveyed how it would respond to the 8th Circuit decision.

But a three-judge panel of the D.C. Circuit tossed out the case last year after finding the group should have brought its challenge to federal district court — not the appeals court — under the Clean Water Act (Greenwire, Feb. 28, 2017).

The Supreme Court issued a similar decision in the Clean Water Rule litigation, rebuffing the federal government's arguments that litigation belonged in appeals courts.

The Clean Water Act routes challenges to effluent limitations, other limitations and permitting decisions to appeals courts; other cases go to district courts (Greenwire, Jan. 22).

AMERICAN OVERSIGHT

In its petition to the Supreme Court, the Center for Regulatory Reasonableness argued the D.C. Circuit's decision has "powerful consequences" for the 43 states outside the 8th Circuit.

EPA is "free to impose even vacated" water permitting modifications, "with little fear of the immediate judicial review," the petition said.

The Justice Department had urged the court to decline the case. Government attorneys said the D.C. Circuit correctly concluded EPA's letters interpreting the 8th Circuit decision weren't actions that could be challenged in appeals court under the Clean Water Act.

Challenging the 'puppet master'

At issue in the second case was a Southern California Alliance of Publicly Owned Treatment Works (SCAP) suit challenging EPA's objections to state-issued permits for two water reclamation plants in El Monte and Pomona, Calif.

EPA in 2014 sent a formal objection letter to the Los Angeles Regional Water Quality Control Board threatening to veto the permits. The agency said the approvals, which the Los Angeles board later modified, didn't include necessary daily and monthly limits.

But the alliance argued that EPA used the objection letter to create new rules about permitting without formal notice and comment.

The 9th U.S. Circuit Court of Appeals, however, ruled that it couldn't hear the case because the letter in question was just an "interim step in a complex statutory scheme" and not subject to review by federal court. The 9th Circuit directed the alliance to pursue its case either administratively or in a state court.

The alliance appealed, arguing that the court failed to differentiate between EPA's objections to the permit and the permit itself.

AMERICAN OVERSIGHT

"U.S. EPA continues to use its objection powers to unlawfully push states to adopt measures beyond the requirements of federal regulations," SCAP said. "The 9th Circuit's decision ... relegated SCAP to challenging the puppet, when SCAP seeks to directly challenge the actions of the puppet master."

The Justice Department asked the Supreme Court to pass on the case. DOJ said the EPA letter in question did not set out any binding effluent limitations.

Other cases

At their weekly conference Friday, justices are scheduled to consider a third Clean Water Act petition asking them to overturn a decision that reinstated EPA's contentious "water transfers" rule. They could announce whether they're taking up that case early next week (Greenwire, Sept. 21, 2017).

Along with the water disputes, the Supreme Court today also declined a handful of other environment- and energy-related cases.

Justices won't review a lower court's split decision that North Carolina lacked sovereign control over 45 miles of riverbed where Alcoa Power Generating Inc. had built and operated four hydroelectric dams.

The Tar Heel State argued the company had illegally continued to use the Yadkin River for hydroelectric plants without permission after shuttering an aluminum smelting plant that drew power from the dams (Greenwire, Nov. 15, 2017).

Greens' efforts to halt a hydroelectric project in North Carolina likewise dead-ended. American Rivers and the city of Rockingham had challenged the Federal Energy Regulatory Commission's approval of a license for Duke Energy Progress' Tillery development on the Yadkin and Pee Dee rivers (Greenwire, Jan. 12).

AMERICAN OVERSIGHT

The court also won't hear claims by a group of plaintiffs who allege they developed cancer after being exposed to radiation emissions at Nuclear Materials and Equipment Corp.'s facility in Apollo, Pa. The site processed uranium and provided enriched uranium for naval reactors from the 1950s to the early 1980s.

The Hill

Hundreds of mayors unite against Trump reversal of Obama-era climate plan

By John Bowden, 2/21/18, 9:46 AM

Hundreds of mayors representing cities in 47 states and territories have signed a letter opposing the Trump administration's move to roll back the Obama administration's Clean Power Plan (CPP).

In a letter addressed to Environmental Protection Agency (EPA) chief Scott Pruitt, 236 U.S. mayors wrote that the Trump administration's attempt to roll back the environmental restrictions would have "devastating health and economic impacts on their communities."

"We strongly oppose the proposed repeal of the Clean Power Plan, which would put our citizens at risk and harm our efforts to address the urgent threat of climate change," the letter to Pruitt reads.

"The legal authority of cities and other municipalities generally extends only as far as their state governments and federal law allow, and as a result, our local efforts to address climate change

AMERICAN OVERSIGHT

are highly sensitive to national policies like the Clean Power Plan, which shape markets, steer state action, and have large direct impacts on nationwide emissions," it continues.

The EPA has been considering a plan to repeal the Clean Power Plan, the centerpiece of former President Obama's environmental agenda, since at least October.

"The Obama administration pushed the bounds of their authority so far with the CPP that the Supreme Court issued a historic stay of the rule, preventing its devastating effects to be imposed on the American people while the rule is being challenged in court," Pruitt said in a statement last year.

"We are committed to righting the wrongs of the Obama administration by cleaning the regulatory slate. Any replacement rule will be done carefully, properly, and with humility, by listening to all those affected by the rule."

The final version of the CPP was unveiled in 2015, and aimed to reduce carbon dioxide emissions from electrical power generation by 32 percent by 2030. President Trump signed an executive order last March ordering the EPA to review the rule for a possible repeal.

OMB greenlights bid to scrap Obama oil and gas guidelines

By Sean Reilly and Niina Heikkinen, 2/20/18

The White House Office of Management and Budget has cleared U.S. EPA's proposal to scrap

AMERICAN OVERSIGHT

pollution-reduction guidelines for existing oil and gas operations, setting the stage for the rollback of another piece of the Obama administration's environmental agenda.

OMB's Office of Information and Regulatory Affairs finished a standard interagency review of the proposed withdrawal notice for the "control techniques guidelines" on Friday, according to the Reginfo.gov website. Once the notice is signed, EPA will put the proposal out for public comment, an agency spokeswoman said in an email today.

The guidelines, issued in October 2016, were a key part of EPA's strategy then for reducing emissions of volatile organic compounds (VOCs) from existing oil and gas facilities. In sunshine, VOCs react with nitrogen oxides to form ozone, a lung irritant that is the main ingredient in smog.

Although not a regulation, the guidelines are technical recommendations for states to consider for areas deemed in "moderate" nonattainment or worse for EPA's 2008 ozone standard of 75 parts per billion. They also apply in the Ozone Transport Region, which encompasses 11 Northeastern states, the District of Columbia and Northern Virginia.

"It is addressing sources that you wouldn't otherwise get at from ozone regulation," Joanne Spalding, senior managing attorney at the Sierra Club, said in a recent interview.

States can use "reasonable cost" technological fixes to control the pollutants, such as replacing high-bleed pneumatic controllers with low-bleed controllers. At the time, EPA billed the recommendations as a way to also reduce emissions of methane, a potent greenhouse gas, and save the industry money in lost product.

While EPA officials have so far not formally laid out their rationale for now seeking the guidelines' repeal, that step would mesh with the Trump administration's goal of easing requirements that would be seen as hindering domestic energy production (Greenwire, Dec. 15, 2017). The oil and gas industry, citing the potential price tag for smaller producers, had opposed the guidelines' adoption.

AMERICAN OVERSIGHT

The guidelines — often known by their acronym, CTGs — were released as part of an Obama-era suite of requirements aimed at controlling a range of pollutants from the oil and gas industry. This included landmark regulations to reduce methane releases from new and modified sources, according to Spalding.

EPA Administrator Scott Pruitt's decision to withdraw the CTGs comes on the heels of efforts to roll back or delay parts of those methane regulations. EPA plans to release a notice of proposed rulemaking on changes to the new source rule in August and anticipates the release of a final rule in 2019.

EPA had sent the proposed notice of withdrawal of the control techniques guidelines to OMB in mid-December (Greenwire, Dec. 18, 2017).

Judges hear arguments over 2 EPA listing decisions

By Amanda Reilly, 2/20/18

An appeals court today considered U.S. EPA decisions to add sites to a list of the nation's most contaminated areas, including a large mining district that contains the Gold King abandoned mine.

EPA put the Bonita Peak Mining District and nine other sites on its national priorities list of Superfund sites in September 2016.

AMERICAN OVERSIGHT

Sunnyside Gold Corp. has filed a lawsuit challenging EPA's decision to list the mining district. In a separate suit, a pair of companies argue that the agency broke the law in adding the site of a former dry cleaner and auto shop in Indiana.

The U.S. Court of Appeals for the District of Columbia Circuit today heard back-to-back arguments in the cases.

While not directly related, the 2015 Gold King abandoned mine rupture is part and parcel of the Bonita Peak Mining District challenge.

In August of that year, EPA contractors accidentally triggered the rupture at the Gold King site, sending 3 million gallons of toxin-laced water into the Animas and San Juan rivers, which then flowed through a corner of New Mexico into Utah.

A little more than a year later, EPA added the abandoned mine to its national priorities list as part of the larger 100,000-acre Bonita Peak Mining District. The larger district has been a "hotbed of hardrock mining activity for gold, silver, lead and copper" since the 1870s, according to EPA, and includes three drainage areas that converge in the Animas River.

Sunnyside Gold Corp., which operates the Sunnyside mine, sued. The company argues that EPA — faced with lawsuits and recrimination over the 2015 rupture — issued an "overly broad listing" that sets a "terrible precedent."

The company says EPA failed to evaluate all the sources within the mining district — including Sunnyside mine and other sites it owns — under the Hazard Ranking System. EPA used the system to score only 19 of the individual contamination sources within the Bonita Peak Mining District; the site includes another 27 sources that weren't scored.

"If you're going to put property on the [national priorities list], you need to score it," Neil Westesen, an attorney representing Sunnyside, argued today in the courtroom.

AMERICAN OVERSIGHT

He added that the owners of nonscored properties would potentially be faced with steep cleanup costs under the national Superfund law.

Sunnyside says it's already spent more than $15 million remediating multiple locations within the mining district. It installed bulkheads in tunnels of the Sunnyside Mine network, including one in a tunnel that connected Sunnyside Mine to the Gold King abandoned mine. New Mexico and the Navajo Nation both named Sunnyside as a plaintiff in their litigation over the 2015 blowout, but the company says it's not responsible for the incident in any way.

For its part, EPA argues it was not required to score all the pollution sources within the broader mining district. It says that the 19 sites it chose to score were representative of the mining operations in the area and that acid mine drainage from all the sources within the district "commingled" as it flowed into waterways.

The mining district is a "single site" encompassing multiple sources, said Meghan Greenfield, a Justice Department attorney representing EPA.

She warned of the consequences of the court ordering EPA to "nitpick" each individual source within a larger site.

At an industrial site, Greenfield said, "their approach would have EPA score every barrel of leaking substances."

In court documents, EPA also says it did not separately evaluate the 2015 blowout at the mine in its decision to list the Bonita Peak Mining District. The agency says it would have placed the district on the national priorities list regardless of the incident.

At today's arguments, Judge Harry Edwards, a Carter appointee, said EPA's approach appeared to be "consistent" with the regulations guiding the use of the Hazard Ranking System. He said Sunnyside was "conflating" the terms "source" and "site" in EPA's regulations.

AMERICAN OVERSIGHT

"The regulation absolutely distinguishes between a site and a source," he said.

Senior Judge Douglas Ginsburg, a Reagan appointee, also appeared at times to side with EPA, saying the Sunnyside mine wasn't completely mitigated despite the company's efforts.

He expressed some concern, though, about the practical consequences of the listing.

A listing on the national priorities list is akin to a "roach motel" in which a company gets caught up in the system and doesn't come out, Ginsburg said.

Indiana site

EPA is facing a separate lawsuit over its September 2016 decision to place an industrial site in Indiana on the national priorities list.

But while the case involves the same topic, it raises different legal issues.

At issue is the West Vermont Drinking Water Contamination site in Marion County, Ind. At the site, a former dry cleaner discharged wastewater containing perchloroethylene into a leaky sewer system that then migrated into groundwater, according to court documents. A carburetor and brake remanufacturing facility operated between 1956 and 1973 also contributed to contamination.

EPA based its decision on findings that aquifers within 2 miles of the sites are "interconnected" and that municipal well fields 4 miles away could be affected by contamination.

Aimco Michigan Meadows Holding LLC, which was formed in 1999 to acquire the apartment and shopping center on the site, and Genuine Parts, the successor to the car repair shop,

AMERICAN OVERSIGHT

challenged the listing under administrative law.

Catherine Stetson, an attorney representing the companies, today argued that EPA made a "fundamental" failure by not responding to comments and studies contained in the record, including evidence showing a "confining layer" of clay or till that prevented contamination from reaching water supplies.

She also argued that EPA neglected to pay heed to the direction of groundwater flows.

"Groundwater flows away from the well fields that are of interest to EPA," Stetson said.

Edwards said he had some issues with EPA's analysis.

"It isn't clear to me that the agency has given substantial evidence in this record with respect to hydrologic interconnection," Edwards said, adding, "You're assuming it all the way through, and I don't see it."

InsideEPA

https://insideepa.com/daily-news/epa-names-chemical-company-lawyer-waste-offices-deputy-slot

EPA Names Chemical Company Lawyer To Waste Office's Deputy Slot

2/21/18

AMERICAN OVERSIGHT

EPA has named Steven Cook, corporate counsel for one of the world's largest plastics and chemical companies, to be the deputy assistant administrator in the agency's waste office, making him the highest-ranking political official in the office even as a long-time confidante to Administrator Scott Pruitt continues to lead the office's high-profile Superfund reform effort.

Cook, who served as in-house senior counsel for LyondellBasell, started as deputy assistant administrator for the Office of Land & Emergency Management (OLEM) Feb. 20, according to an email sent to staff from Principal Deputy Assistant Administrator Barry Breen. The slot does not require Senate confirmation.

Breen, a long-time career official, has effectively been heading the office in the absence of a political appointee at OLEM, since the Trump administration took office. Typically, a career official occupies the position of principal deputy assistant administrator, while the deputy assistant administrator is a political appointee.

Patrick Davis, President Donald Trump's Colorado campaign director, filled the deputy slot for part of 2017.

And Albert Kelly, a controversial former Oklahoma banker who has known Pruitt for years, has been leading the administrator's Superfund reform push.

While Cook will bring an industry perspective to the office, it is unclear if he will be able to address industry concerns that Pruitt is adopting costly excavation remedies at some Superfund sites.

In addition to his role at LyondellBasell, Cook also served as vice chair of the board of directors of the Corporate Environmental Enforcement Council (CEEC), a cross-industry coalition whose members include a host of major energy, chemical, aerospace, transportation, pharmaceutical, food processing and transportation companies.

Of the more recent public comments filed by CEEC are comments submitted in 2016 on EPA's proposed Risk Management Programs rule for preventing accidental chemical releases, a

AMERICAN OVERSIGHT

measure that Pruitt is now seeking to withdraw.

In its comments, CEEC strongly criticized the Obama administration's proposed version of the rule, including its call for third-party audits and EPA's failure to coordinate the rulemaking with other agencies.

According to LyondellBasell's website, the company is one of the largest plastics, chemical and refining companies in the world. It is the leading producer of oxyfuels in the world, and is the top producer in North America and Europe of polypropylene, its website says.

Cook holds both a law degree and chemical engineering degree from Brigham Young University, as well as a masters of business administration degree from the University of Texas at Austin, according to his LinkedIn profile.

'Lean' training this spring — operations chief

By Kevin Bogardus, 2/20/18

Training in U.S. EPA's streamlined management techniques will begin soon, the agency's No. 3 official said in an internal email to employees today obtained by E&E News.

Assistant Deputy Administrator Henry Darwin wrote that "deployment training" for EPA's "Lean" management system for teams of agency employees is happening this spring. It comes as the agency looks to boost employee engagement.

AMERICAN OVERSIGHT

Darwin noted in his email that while engagement has increased in the Federal Employee Viewpoint Survey, which polls government workers' morale and committment to their jobs, EPA still ranks in the bottom half of large federal agencies.

Darwin cites a speaker at last month's conference for senior leaders — John Kamensky, a senior fellow with the IBM Center for the Business of Government — who said engagement goes up when employees have latitude to improve their jobs, the training to accomplish that goal and good communication with their bosses.

"Through [Lean management], EPA will achieve these three elements of engagement," said Darwin. "Weekly huddle meetings around visual management boards will provide teams — staff and management alike — the means to see how work is flowing and to identify ways of improving the work process.

"[Lean] deployment training for teams across the agency will begin this spring, and coaching will always be available to help with the new approaches," he said.

In addition, managers are expected to check in with their subordinates every day to boost communication and resolve issues, said Darwin.

"Finally, our expectations of agency managers will include short, daily, one-on-one check-ins with staff members to increase communication and, as always, solve small problems before they become big problems," Darwin said, concluding, "I realize that the work we've done so far feels top down, but that will soon change. Thank you in advance for joining me on this journey."

The Lean system is essentially the foundation for EPA's "reform plan" to streamline operations, which was called for under an executive order signed by President Trump last year.

The agency has also set up a steering committee of career officials and political appointees,

AMERICAN OVERSIGHT

which Darwin has tasked with drafting a vision for EPA (Greenwire, Feb. 6).

IG to examine emergency-response gear

By Kevin Bogardus, 2/21/18

U.S. EPA's inspector general plans to take stock of equipment used to respond to natural disasters and terrorist attacks.

In a notice dated yesterday, the internal agency watchdog said it plans to begin "preliminary research" on how EPA manages equipment used in counterterrorism activities and emergency response.

"The OIG's objective is to determine whether the EPA has the needed and required counter terrorism and emergency response equipment and whether the equipment is efficiently managed, tracked and available for potential counter terrorism or emergency response incidents," said the notice signed by Michael Davis, director of the Efficiency Directorate in the IG's Office of Audit and Evaluation.

The IG initiated the project on its own and plans to work in several program offices, including the Office of Land and Emergency Management and the Office of Homeland Security, as well as regional branches for the agency.

The watchdog also asked for many documents, such as a list of all such equipment as well as any

AMERICAN OVERSIGHT

interagency agreements related to the buying and management of the equipment.

The probe comes after last year's devastating hurricane season, which saw EPA respond to major storms in Texas, Florida and Puerto Rico.

As part of its emergency-response function, EPA works on oil spills, chemical and radiological accidents or attacks, as well as natural disasters. Some of the agency's equipment for the job includes aircraft to detect chemical and radiological leaks and a mobile laboratory, as well as protective gear like hazmat suits.

Oil spill cleanup underway in suburban Oklahoma City

2/20/18

YUKON, Okla. (AP) — A spokesman for the Environmental Protection Agency says cleanup is underway in suburban Oklahoma City where about 2,000 barrels of oil spilled from a ruptured pipeline.

EPA on-scene coordinator Mike McAteer said Tuesday workers are skimming oil off the surface of a 7-acre pond near a neighborhood outside Yukon, about 17 miles (27 kilometers) west of Oklahoma City.

McAteer says oil bubbled into the pond early Sunday from a pipeline operated by Centurion

AMERICAN OVERSIGHT

Pipeline L.P. He says crews will tunnel beneath the pond to inspect the ruptured pipeline and prevent further releases.

McAteer says cleanup efforts have been slowed by rain and sub-freezing temperatures in the area.

Centurion spokesman Eric Moses says the company is making progress "and will continue to work safely and efficiently until our work is complete."

Reuters

https://www.reuters.com/article/us-missouri-lawsuit/missouri-residents-sue-over-radioactive-material-storage-sites-idUSKCN1G50AZ

Missouri residents sue over radioactive material storage sites

2/20/18, 11:09 PM

(Reuters) - Residents living near landfill sites in the St. Louis area where radioactive waste has been stored filed lawsuits on Tuesday seeking compensation, claiming negligence in handling materials they said were some of the most dangerous on Earth.

Two lawsuits seeking class action status were filed at St. Louis County court for sites that included the West Lake Landfill in Bridgeton, Missouri, and an area near the Coldwater Creek in the county.

Among the 10 defendants are Republic Services, Exelon Corp and the Cotter Corp. Officials from those companies were not immediately available for comment.

AMERICAN OVERSIGHT

"Defendants treated these hazardous, toxic, carcinogenic, radioactive wastes with about the same level of care that a reasonable person might give to common household garbage, dumping it without authority from the State of Missouri and in violation of law," the lawsuits contend.

The suits did not state an amount being sought by the plaintiffs.

The history of nuclear waste in the St. Louis area dates back to the U.S. atomic bomb program from World War Two and spans an array of nuclear processing facilities, storage sites, material transfers and suspected leaks along the way.

The U.S. Environmental Protection Agency has deemed some of the St. Louis-area places that were a part of that history "Superfund" sites, placing them among highly polluted areas that are a national priority for clean-up.

The West Lake site, originally used for agriculture, became a limestone quarry in 1939. But starting in the 1950s, portions of the area were used to dispose of municipal refuse, industrial wastes and construction debris, the EPA said.

In 1973, some 8,700 tons of leached radioactive barium sulfate from the Manhattan Project, the World War Two-era atomic bomb-development program, were mixed with 38,000 tons of soil used to cover trash dumped at the site, according to the EPA.

In 1990, the landfill and neighboring waste-disposal facilities occupying a total of 200 acres (80 hectares) were designated by the EPA as a single Superfund site.

IG report discounted Tar Creek Superfund fraud claims

By Mike Soraghan, 2/21/18

An investigation by U.S. EPA's watchdog agency in 2013 discounted allegations of fraud at the Tar Creek Superfund site in 2013.

The findings of EPA's inspector general run counter to those of Oklahoma State Auditor Gary Jones, who says his audit found criminal violations at the site.

But they track with the decision of then-Oklahoma Attorney General Scott Pruitt, who declined to bring charges after receiving Jones' audit.

"This investigation revealed no evidence to support any allegations by the complainants," states the EPA IG report, first reported by the newspaper Tulsa World.

Pruitt, now EPA administrator, and his replacement, Mike Hunter, kept the audit secret. So it is not clear how similar the investigations might have been.

Daniel Stevens, who heads a group suing to get the audit made public, said people should be able to compare the two reports.

"It sure seems like Pruitt and his allies are worried about the conclusions contained in the state auditor's report," said Stevens, executive director of Campaign for Accountability. "Pruitt should be held accountable for how he responded to the findings of his own state's auditor."

AMERICAN OVERSIGHT

A hearing in the case has been set for Friday in Oklahoma County District Court.

Tar Creek is a 40-square-mile site in the far northeastern corner of Oklahoma where land and water were contaminated by decades of lead and zinc mining that ended in the 1950s. In the early 1980s, EPA deemed it the most contaminated site in the country.

As part of the cleanup, the federal government provided money in 2009 to buy out homeowners and demolish the homes. The work was overseen by a board of prominent residents called the Lead-Impacted Communities Relocation Assistance Trust.

But companies that sought demolition work complained that contracts were being unfairly steered to companies favored by board members. Jones has said his audit showed the government paid six times more than needed.

The investigation by EPA's IG was prompted by a federal whistleblower lawsuit filed in 2012. The suit alleged the trust board and contractors tapped into a "good ole boy network" and hatched a "sophisticated conspiracy" to rig bids and pay for work that was not done.

But the IG report says there were valid explanations for what the whistleblower suit called violations.

For example, the suit alleged that one of the contractors billed for demolition of the Picher, Okla., house where baseball slugger Mickey Mantle got married in 1951, even though the house is still standing at a location in the nearby town of Commerce. The IG report said after the house was moved that the contractor still had to clear debris and other items from the site, and deserved to be paid.

The redacted IG report is available on EPA's Freedom of Information Act release website. It was requested in 2015 by former trust chairman Mark Osborn.

AMERICAN OVERSIGHT

Several entities, including E&E News, have requested Jones' Tar Creek audit and related documents. The requests have been rejected. Campaign for Accountability sued in November.

Hunter, the attorney general, is fighting the suit, citing grand jury secrecy (Energywire, Jan. 19). But Jones, the state auditor, responded by seeking a court order to release the audit. Jones has also said Pruitt "acted improperly" when, as attorney general, he sent a copy of the audit to the attorney for the trust.

Hunter's office filed a pleading last week countering some of Jones' claims and asserting that the audit is "shot full" of grand jury evidence.

Subject: POLITICO Magazine: Tar Creek, Oklahoma

Hi, I'm a contributing writer with POLITICO magazine. I'm requesting an interview with EPA administrator Scott Pruitt for an upcoming story. **My deadline is Tuesday, October 10**.

The story will be focusing on the EPA Superfund site at Tar Creek, Oklahoma, and the narrative would greatly benefit from Mr. Pruitt's input. There have been many suggestions coming from within the EPA and the White House that Tar Creek has been identified as an example of how Mr. Pruitt will approach Superfund sites across the country. In a January 2017 story for *Bloomberg BNA*, a few days before Mr. Pruitt was confirmed, a White House spokesperson cited a buyout program that took place at Tar Creek as an example of Pruitt's guiding philosophy: "national standards; neighborhood solutions." In August, senior advisor Kel Kelly was touring the site.

Given the prominence that Tar Creek — an EPA Superfund site since the 1980s — has recently taken on, I'd like to discuss Mr. Pruitt's views on the buyout program and overall job the EPA has done there.

AMERICAN OVERSIGHT

Please let me know who I can reach out to directly within the Administrator's office regarding my request.

Thank you,

Malcolm Burnley

Washington Examiner: EPA Appoints Region Head to Cover Home of Lead-Contamination Crisis

Environmental Protection Agency Administrator Scott Pruitt appointed Cathy Stepp to become regional administrator for Region 5, which includes the home of the lead contamination crisis in Flint, Mich., the agency announced Tuesday. Stepp will oversee EPA efforts in Indiana, Illinois, Michigan, Minnesota, Ohio, and Wisconsin. The Region 5 office has become of critical political importance in recent years after the Flint drinking water crisis captured national attention during last year's presidential election.

AMERICAN OVERSIGHT

Brownfield Ag News: EPA says Glyphosate does not cause cancer in humans

The Environmental Protection Agency has released a draft human health risk assessment stating that weed-killer glyphosate likely does not cause cancer in humans. The assessment concluded there are no meaningful risks to human health when the pesticide label is followed, and it should be classified as "not likely to be a carcinogen for humans." The EPA says the findings are consistent with the 2017 National Institute of Health Agricultural Health Survey, which found "no statistically significant associations with glyphosate use and cancer at any site."

Portland Business Journal: EPA, Four Companies Reach Key Portland Harbor Superfund Cleanup Deal

The Environmental Protection Agency and four major industrial polluters have agreed on a key next step in the Portland Harbor Superfund site cleanup, the federal agency announced on Tuesday. The agreement between Arkema Inc., Evraz Inc. NA, Schnitzer Steel IndustriesInc., the Marine Group LLC and the EPA sets the framework of a $14 million sampling plan that will be used to guide and assess the cleanup of the polluted 10-mile stretch of the Willamette River.

The Californian: Salinas Oil Company Penalized for Environmental Violations

In September 2016, the EPA inspected the company and found there was a violation of the Clean Water Act's Oil Spill Prevention, Control and Countermeasure, according to an EPA press statement. The inspection found that there was a lack of secondary containment to keep oil that had been spilled from leaking into nearby water, a lack of safe and appropriate containers for the storage of oil, a failure of regular inspections and tank integrity testing and failure to provide and maintain records from the company's compliance with requirements, according to the press release.

Joplin Globe: John Berrey: Politico Got It Wrong on Tar Creek

After decades of exploitation, environmental devastation, mismanagement of natural resources and broken promises, the Quapaw tribe, with the help of Sen. Inhofe, Pruitt and the EPA, and the state of Oklahoma, has taken a leadership role at the Tar Creek site. With all due respect to the former residents of the Tar Creek area and Politico, the real story at Tar Creek is this: The members of an Indian tribe were promised land as a place to be Quapaw. Now they are taking it back one truckful of mine waste at a time.

AMERICAN OVERSIGHT

Missourinet: Missouri Lawmakers Differ on Fixing St. Louis Area Landfill before EPA Head Decides

EPA head Pruitt told a U.S. House committee in early December that he'll release a decision next month on what will be done at West Lake Landfill. The site will either be capped, as Kehoe and the group of Republican State Senators want, or it will be excavated. Meanwhile, Democratic State Senator Maria Chappelle-Nadal of University City refiled the same measure she put forth last session to assist homeowners in contaminated areas. Under the plan, if a federal or state environmental or state health agency determined a home to be uninhabitable due to contamination from certain radiation, the owner would be eligible to sell the home for fair market value through the Missouri contaminated home acquisition program administered by the state Department of Natural Resources.

National Morning News Highlights 12.20.17

Politico: Senators, White House Lay Groundwork for Dreamers Deal

Top senators and White House officials are laying the groundwork for a major immigration deal in January to resolve the fate of young undocumented immigrants whose legal protections were put in limbo by President Donald Trump. At a Tuesday afternoon meeting with nearly a dozen senators deeply involved in immigration policy, White House chief of staff John Kelly pledged that the administration will soon present a list of border security and other policy changes it wants as part of a broader deal on so-called Dreamers, according to people who attended the meeting. The plan could come in a matter of days, senators said.

Bloomberg: Christmas Comes Early for Trump with Tax Win

After a year of infighting, frustration and failure, President Donald Trump and his Republicans finally have something to celebrate. The Senate early this morning passed the largest U.S. tax overhaul in more than three decades with barely a vote to spare, bringing Trump to the brink of his first big legislative win. One more (likely routine) vote in the House and the bill could be on his desk as soon as this afternoon.

Yahoo! Congress Discloses 3 More Sexual Harassment Settlements

The Office of Compliance of the U.S. House of Representatives revealed on Tuesday three

AMERICAN OVERSIGHT

additional sexual-harassment settlements it paid out, totaling $115,000, the Hill reports. The disclosure comes just one month after the Washington Postrevealed the Office paid more than $17 million since 1997 to settle 264 workplace complaints (including harassment allegations).

The Oklahoman: Incentive Review Shows Value of Tax Simplicity

This year, the state's Incentive Evaluation Commission reviewed 12 state economic tax incentives and ultimately voted to repeal five. Revenue increases associated with those repeal votes will be relatively minor. Instead, the biggest impact of the commission's work may be that it reinforces the fact that politicians have a poor record when it comes to identifying and nurturing job creation via targeted tax breaks.

Washington Examiner

http://www.washingtonexaminer.com/epa-appoints-region-head-to-cover-home-of-lead-contamination-crisis/article/2643923

EPA Appoints Region Head to Cover Home of Lead-Contamination Crisis

By: John Siciliano, 12/19/17

Environmental Protection Agency Administrator Scott Pruitt appointed Cathy Stepp to become regional administrator for Region 5, which includes the home of the lead contamination crisis in Flint, Mich., the agency announced Tuesday.

Stepp will oversee EPA efforts in Indiana, Illinois, Michigan, Minnesota, Ohio, and Wisconsin.

The Region 5 office has become of critical political importance in recent years after the Flint drinking water crisis captured national attention during last year's presidential election.

The drinking water crisis in the working-class city north of Detroit also became a focal point in congressional oversight last year and in major spending bill fights. The crisis started after Republican Gov. Rick Snyder appointed a project manager to find more cost-effective ways of supplying water to Flint.

AMERICAN OVERSIGHT

The appointee signed off on a plan to divert the city's water supply from Lake Michigan to the Flint River, which caused the drinking water pipes in the city to corrode, sending large amounts of lead into residents' drinking water.

Stepp is coming from the EPA Region 7 office, where she serves as principal deputy regional administrator. Region 7 serves Iowa, Kansas, Missouri, Nebraska and nine tribal nations.

She previously served in the Midwest region as the secretary of the Wisconsin Department of Natural Resources from 2011 to 2017. She also served as a state senator in Wisconsin.

Pruitt said her experience brings "a fresh perspective to EPA as we look to implement President Trump's agenda."

Susan Hedman, the Region 5 head who served under the Obama administration's EPA, resigned over the Flint water crisis after it was reported that she refused to provide information on the lead contamination crisis after being contacted by the mayor.

Brownfield Ag News

EPA says Glyphosate does not cause cancer in humans

By: Amie Sites, 12/19/17

The Environmental Protection Agency has released a draft human health risk assessment stating that weed-killer glyphosate likely does not cause cancer in humans.

AMERICAN OVERSIGHT

The assessment concluded there are no meaningful risks to human health when the pesticide label is followed, and it should be classified as "not likely to be a carcinogen for humans."

The EPA says the findings are consistent with the 2017 National Institute of Health Agricultural Health Survey, which found "no statistically significant associations with glyphosate use and cancer at any site."

The findings contradict the advisory by the World Health Organization's International Agency for Research on Cancer (IARC), which concluded in 2015 that glyphosate is "probably carcinogenic." The state of California plans to add glyphosate to its list of cancer-causing chemicals, which requires that products containing or grown with glyphosate carry warnings that it is a known carcinogen.

The EPA will open a 60-day comment period on the draft human health and ecological risk assessment.

Portland Business Journal

https://www.bizjournals.com/portland/news/2017/12/19/epa-four-companies-reach-key-portland-harbor.html

EPA, Four Companies Reach Key Portland Harbor Superfund Cleanup Deal

By: Pete Danko, 12/19/17

The Environmental Protection Agency and four major industrial polluters have agreed on a key next step in the Portland Harbor Superfund site cleanup, the federal agency announced on Tuesday.

The agreement between Arkema Inc., Evraz Inc. NA, Schnitzer Steel IndustriesInc., the Marine Group LLC and the EPA sets the framework of a $14 million sampling plan that will be used to

AMERICAN OVERSIGHT

guide and assess the cleanup of the polluted 10-mile stretch of the Willamette River.

In a joint statement, Schnitzer (NASDAQ: SCHN) and the Marine Group said the agreement "will expedite the cost-effective cleanup of the site in a way that is protective of public health and the environment, while ensuring that this waterway that is so vital to Oregon's economy continues to be a working harbor."

Yet environmentalists and state environmental regulators say the agreement falls short of their hopes.

The Oregon Department of Environmental Quality's Sarah Greenfield, in-water coordinator on the cleanup project, said that while the sampling plan would provide "a lot of necessary data," there "are a few data gaps and a few additional pieces of information that we hoped to see."

The agreement represents one of the first major steps in implementing the 13-year, $1.05 billion cleanup plan unveiled by the Obama administration in January.

In October, DEQ and local officials, tribal leaders and environmental organizations had criticized the EPA over a draft agreement between the EPA and four then-unnamed companies, saying it threatened to undo the Obama administration's record of decision.

Gov. Kate Brown described the EPA draft agreement in October as a "significant setback" that "undermines the progress we've made."

On Tuesday, Bob Sallinger, conservation director for Portland Audubon, said the latest deal might not be as bad as that October version, but it's not what environmentalists hoped to see, nor what the EPA had been talking about earlier in the year.

In addition to sampling the contaminated river bottom, those earlier drafts called for sampling numerous "potential wildlife receptors," which could give further insight into the effectiveness

AMERICAN OVERSIGHT

of the cleanup.

The settlement, Sallinger said, calls for sampling only one species, smallmouth bass.

“This sampling plan is significantly weaker than the draft plans that the EPA had sent out in June,” Sallinger said.

The DEQ's Greenfield said the agency was also hoping to see additional fish tissue sampling, particularly of carp, one of the more commonly eaten fish from the river.

Schnitzer defended that part of the plan.

"We had prepared our proposal prior to the release of EPA's proposal and our sampling plan focused on the smallmouth bass because in the record of decision that is the primary species of concern for fish consumption risk," a company spokesperson said. "EPA agreed with this approach and agreed that it could do additional sampling including other species in the future.”

Sallinger, however, said it was disappointing that only four polluters — out of several dozen potentially responsible parties — had been allowed to define the baseline sampling plan.

The Californian

Salinas Oil Company Penalized for Environmental Violations

By: Cristian Ponce, 12/19/17

Encore Oils and Ottone-Salinas, Inc. have been penalized for several federal Clean Water Act

AMERICAN OVERSIGHT

violations.

The U.S. Environmental Protection Agency reached a settlement Tuesday with both companies in an effort to prevent the risk of oil spills from their biodiesel processing facility in Salinas to the Monterey Bay Watershed.

The settlement includes a $31,893 penalty and resolves several Clean Water Act Violations, according to the press release from the EPA.

Ottone-Salinas, Inc. owns the property that Encore Oils, also known as SeQuential, operates on, located ten feet from Alisal Creek which flows into the Salinas River.

In September 2016, the EPA inspected the company and found there was a violation of the Clean Water Act's Oil Spill Prevention, Control and Countermeasure, according to an EPA press statement.

The inspection found that there was a lack of secondary containment to keep oil that had been spilled from leaking into nearby water, a lack of safe and appropriate containers for the storage of oil, a failure of regular inspections and tank integrity testing and failure to provide and maintain records from the company's compliance with requirements, according to the press release.

These regulations are put in place to reduce the risk of having oil reach nearby waters and to make sure there is adequate containment of oil spills, according to the press release.

Under the agreement with the EPA, SeQuential has put in place different safeguards to make sure oil spills will not reach nearby waterways, which include closing tanks that are failing.

John Berrey: Politico Got it Wrong on Tar Creek

By: John Berrey, 12/19/17

As the longtime chairman of the Quapaw Tribe of Oklahoma, I take strong exception to the Dec. 6 article by Politico's Malcom Burnley ("The Environmental Scandal In Scott Pruitt's Backyard"), which showed Burnley to be an accomplished ax-grinder.

This piece indicated that Oklahoma Sen. Jim Inhofe bears significant blame for the complicated nature of the cleanup of the Tar Creek Superfund site located on Quapaw land in Northeast Oklahoma.

Even casual observers know that the complications at Tar Creek existed long before the tenure of Sen. Inhofe. When mining companies discovered lead and zinc ore on Quapaw lands in the early 1900s they were required to acquire mining leases through the federal Bureau of Indian Affairs. Many Quapaw tribal members refused to lease their land to the mining companies. Perhaps not unsurprisingly, the BIA responded by declaring those tribal members "incompetent" and went ahead and executed the mining leases on their behalf.

When the Environmental Protection Agency declared Tar Creek a national priority list Superfund site in 1983, the EPA considered the BIA, along with the mining companies, a "responsible party" because of BIA's participation in leasing the land for mining and its management of mining practices on Indian leases.

For most of the 30-plus years since being declared a responsible party by EPA, and therefore liable for the cleanup, BIA has refused to accept responsibility for the cleanup or provide any cleanup funds. In fact, because of its fear of past and future liability, the BIA fought every effort by the EPA to clean up mine waste on Quapaw tribal lands. This — not anything Sen. Inhofe did or didn't do — is the primary reason that cleanup of Tar Creek has languished for over most of the last 35 years.

AMERICAN OVERSIGHT

In reality, Sen. Inhofe and his staff, including his former chief of staff Ryan Jackson, should get significant credit for ending the deadlock between EPA and BIA, thereby allowing the start of the cleanup of the mountains of heavy metal-laden mine waste (called "chat") that dominate the landscape on Quapaw land. In the early 2000s, Sen. Inhofe, using his influence as chairman of Environment and Public Works Committee in the Senate and working with Quapaw tribal leaders, brought upper management of the EPA and the Department of the Interior together by facilitating an agreement and sponsoring legislation that would ease fear of liability and allow the EPA to finally begin cleanup of mine waste on tribal lands. Since then, there has been more mine waste cleaned up at Tar Creek than in the previous 30 years combined.

More than once in the article the author states that the Quapaw tribe has been "contracted" to perform cleanup at Tar Creek. This represents a fundamental misunderstanding of the facts and the nature of tribal sovereignty. Under the Superfund law, Indian tribes have the same status as states where Superfund sites are concerned. The EPA cleanup funds that the Quapaw tribe's Environmental Office receives to clean up mine waste on tribal lands are channeled through an inter-agency cooperative agreement — a funding method identical to EPA funding provided to state agencies that participate in Superfund cleanups.

This method of cleanup funding has significant advantages over "contracting" out Superfund cleanup work. By funding a tribe or state agency to perform the work themselves, it allows work to be performed by local entities that know the communities in which they work, not to mention the lower costs that result from avoiding the usual markups of multilayered contractors.

This local control and funding of the cleanups at Superfund sites is consistent with Pruitt's change in the focus of the Superfund program nationwide.

It should be noted that Tar Creek is the first Superfund site in the nation where an Indian tribe has been given the lead by the EPA in site cleanup. It may be news to Malcom Burnley, but the Quapaw tribe has scientists and engineers on staff to provide technical oversight and the tribe has a construction division with heavy equipment and numerous tribal employees with construction and earth moving equipment and experience. These enhancements were a direct result of tribal leaders, the EPA and Sen. Inhofe and his staff working together for over a decade to ensure that the tribe had the capacity and ability to perform this work.

AMERICAN OVERSIGHT

It is reasonable to expect that the tribe, the most adversely affected stakeholder at Tar Creek, should benefit from the cleanup of its own lands. Accordingly, the Quapaw tribe has cleaned up more waste and returned more acres to productive use since 2013, than was cleaned up in the previous 30 years at Tar Creek.

The article states that "(a)s EPA administrator, he (Scott Pruitt) has assumed full responsibility for the still-faltering cleanup." As I pointed out above, the cleanup is far from "faltering," and in fact the state of Oklahoma — seeing how the tribe has achieved unprecedented progress in the cleanup at Tar Creek — has entered into its own inter-agency agreement with the Quapaw tribe to perform cleanup of contaminated nontribal land.

This state/tribe agreement is another nationwide first at a Superfund site. Not surprisingly, after Pruitt sent his senior staff to visit Tar Creek this past summer and report back to him, they reported that because of the tribe's more than adequate capacity to perform the work at a lower cost, and because of the tribe's longstanding relationships with landowners and the local communities, the current remediation work at Tar Creek should be a model for bringing new approaches to large legacy Superfund sites.

Most of the article derides the Lead Impacted Communities Relocation Assistance Trust for alleged mismanagement of the relocation of residents of the Tar Creek area. Although I am not familiar with all of the inner workings of the LICRAT or the nature and validity of all of the grievances of the relocated residents, I do know that all of the residents have been removed from the hazards of the inevitable mine cave-ins that occur at the site on a regular basis.

Members of the LICRAT have also endeavored to see that the tribe ultimately receives the land that was purchased so that the tribe can ensure that the land is remediated and eventually converted into some form that can be safely used as a part of its land base.

It should also be noted that many residents living in the Tar Creek area were living on Quapaw tribal land, and in many cases, did not know it because the BIA had not been collecting rent for decades as it was required to. This resulted in some of the residents' evident resentment toward the LICRAT's proposed buyout offers.

After decades of exploitation, environmental devastation, mismanagement of natural resources

AMERICAN OVERSIGHT

and broken promises, the Quapaw tribe, with the help of Sen. Inhofe, Pruitt and the EPA, and the state of Oklahoma, has taken a leadership role at the Tar Creek site. With all due respect to the former residents of the Tar Creek area and Politico, the real story at Tar Creek is this: The members of an Indian tribe were promised land as a place to be Quapaw. Now they are taking it back one truckful of mine waste at a time.

John Berrey is the chairman of the Quapaw Tribe of Oklahoma.

Missouri Lawmakers Differ on Fixing St. Louis Area Landfill before EPA Head Decides

By: Jason Taylor, 12/19/17

There are competing ideas among Missouri lawmakers for cleaning up the West Lake Landfill Superfund Site west of St. Louis.

Environmental Protection Agency (EPA) administrator Scott Pruitt said earlier this month that the government's taken too long to address the issues while declaring that a decision would be announced in January.

"There's proposals that I'm looking at this month to make a decision on West Lake. It's a very important issue to the people of St. Louis," says Pruitt.

Back in May, bipartisan legislation was introduced by Missouri members of Congress to transfer management of the site from the EPA to the Army Corp of Engineers.

AMERICAN OVERSIGHT

Republican Roy Blunt and Democrat Claire McCaskill teamed up on a measure in the Senate, while GOP member Ann Wagner and Democrat William Lace Clay, both St. Louis area Congress members, file a companion bill in the House.

In October, Republican state Senator Mike Kehoe of Jefferson City sent a letter to the EPA's regional office in Kansas City, asking the agency to follow its own 2008 recommendation to physically cap and isolate the material at the landfill forever.

Kehoe said in his letter that there continues to be no evidence of health risks to individuals living or working near the West Lake site, and that excavating the waste would present unintended hazards.

17 other Republican State Senators signed onto Kehoe's letter, which claims excavation and transportation of waste would create unnecessary exposure and public safety risks on roadways and railways.

The correspondence also points out there's concern among wildlife and aviation experts that excavation would lead to the risk of bird strikes to aircraft approaching and leaving St. Louis' Lambert Airport.

Kehoe's letter expressed sympathy to those who worry their health may have been compromised by the legacy of the Manhattan Project, a World War II nuclear bomb development program which led to the dumping of contaminated waste at the West Lake site in the 1970's.

An underground fire at the nearby Bridgeton Landfill, which has been burning since at least 2010, is making its way toward the radioactive material at West Lake.

While Kehoe's letter dismisses the existence of health risks at West Lake, it states that circumstances at nearby Coldwater Creek have been found to be wholly different.

AMERICAN OVERSIGHT

Kim Visintine of the Coldwater Creek group told Missourinet earlier this month people living in that area have reported a list of health battles, including cancer, autoimmune disease, some cannot have children and some children born with deformities.

EPA head Pruitt told a U.S. House committee in early December that he'll release a decision next month on what will be done at West Lake Landfill. The site will either be capped, as Kehoe and the group of Republican State Senators want, or it will be excavated.

Meanwhile, Democratic State Senator Maria Chappelle-Nadal of University City refiled the same measure she put forth last session to assist homeowners in contaminated areas.

Under the plan, if a federal or state environmental or state health agency determined a home to be uninhabitable due to contamination from certain radiation, the owner would be eligible to sell the home for fair market value through the Missouri contaminated home acquisition program administered by the state Department of Natural Resources.

Chappelle-Nadal's bill calls for up to $12.5 million to be dedicated to achieving the goal.

Senators, White House Lay Groundwork for Dreamers Deal

By: Seung Min Kim, Heather Caygle and Elana Schor, 12/19/17

Top senators and White House officials are laying the groundwork for a major immigration deal in January to resolve the fate of young undocumented immigrants whose legal protections were put in limbo by President Donald Trump.

At a Tuesday afternoon meeting with nearly a dozen senators deeply involved in immigration

AMERICAN OVERSIGHT

policy, White House chief of staff John Kelly pledged that the administration will soon present a list of border security and other policy changes it wants as part of a broader deal on so-called Dreamers, according to people who attended the meeting. The plan could come in a matter of days, senators said.

About a half-dozen senators have been negotiating a bipartisan package prompted by Trump's decision to kill the Deferred Action for Childhood Arrivals program, an Obama-era executive action that granted work permits to nearly 800,000 undocumented immigrants who came here as minors. Yet the senators could not fully flesh out a deal before they knew what Trump was willing to sign.

"We couldn't finish this product, this bill, until we knew where the administration was," Sen. Jeff Flake (R-Ariz.), who has been negotiating a DACA compromise for weeks, said in an interview after the meeting with Kelly. "And that's why this meeting was so important."

Congressional Republicans and the White House have long said any DACA deal would need to be paired with security and other enforcement measures. Democrats say that's fine as long as the provisions weren't too onerous. But the border security question has been a sticking point for weeks, as senators swapped proposals without cutting a deal, so far.

And while liberal Democrats and grass-roots activists are pressuring Congress to enact permanent legal protections for Dreamers this year, both Democrats and Republicans at the meeting with Kelly said there was a consensus that legislation wouldn't pass before lawmakers leave Washington. It was one of the clearest sign yet that a Dreamers agreement won't, to the chagrin of liberals, come before 2018.

"Our belief is that if this matter is not resolved this week — and it's not likely to be resolved — that come the omnibus and the caps, that we have another chance to finally come up with a bipartisan package of things to include" by mid-January, said Sen. Dick Durbin (D-Ill.), who also attended the meeting. "The closer we get [to the March deadline], the more nervous I get, not to mention the way these young people feel. I'm sorry that it's taken this long."

Flake said he believes he has a commitment from Senate Majority Leader Mitch McConnell (R-Ky.) to hold a cloture vote on the floor on an immigration deal by mid-January, before the next

AMERICAN OVERSIGHT

likely deadline to fund the government, Jan. 19.

A spokesman for McConnell did not immediately return a request for comment. But the majority leader said during a Fox News interview that he has talked about the immigration issue with his counterpart, Senate Minority Leader Chuck Schumer of New York.

"No, we'll not be doing DACA … this week," McConnell said. "That's a matter to be discussed next year. The president has given us until March to address that issue. We have plenty of time to do it."

At the Tuesday meeting, Kelly and other administration officials went into detail about how much of the southern border is currently fenced and how much more the White House would want in exchange for a DACA deal, according to people who attended.

Senators also pressed the White House on other immigration demands, such as an overhaul of the nation's asylum system or a change in policy toward unaccompanied minors who are apprehended at the southern border, and whether they needed to be included in the current DACA talks.

"Which of those policy items, or immigration law changes, do we need to make as part of this and what can wait for something else?" Flake said, summing up the questions from senators. "There's a lot of nice things we need to do as part of broader comprehensive reform, but we need to have a bill in January and we need to know what has to be in it and what the administration will support."

The bipartisan group of senators — Flake and Durbin, Michael Bennet (D-Colo.), James Lankford (R-Okla.), Thom Tillis (R-N.C.), Lindsey Graham (R-S.C.) and Cory Gardner (R-Colo.) — has discussed a legalization plan that would marry the DREAM Act, drafted by Durbin and Graham, with a more conservative proposal for Dreamers written by Tillis and Lankford, Flake said.

Those seven senators attended Tuesday's meeting with Kelly, as did Senate Majority Whip John

AMERICAN OVERSIGHT

Cornyn (R-Texas), and Republican Sens. Tom Cotton of Arkansas and David Perdue of Georgia.

"I think what we're trying to do is to get some clarity from the administration on what they require by way of border security and other enforcement measures," Cornyn said as he left the meeting. "We got a promise to provide it to us and hopefully we'll get that in short order. Maybe even this week."

Republicans' commitment to taking up a DACA deal next month won't spare Democrats the fury of liberal groups that have demanded that any spending bill this year include a solution for Dreamers.

Democratic leaders have signaled that they won't risk a government shutdown this month to secure relief for the Dreamers, though some lawmakers have vowed to withhold their votes for any must-pass funding measure without an immigration fix.

Durbin, the influential second-ranking Senate Democrat, is firmly in the camp of senators who won't vote for a spending bill without help for Dreamers. That group also includes liberal Sens. Bernie Sanders (I-Vt.), Kamala Harris (D-Calif.), Kirsten Gillibrand (D-N.Y.), and Elizabeth Warren (D-Mass.).

Durbin was asked by reporters Tuesday if there was a divide between him and Schumer over where to draw the line on the issue, and acknowledged that there "may be."

Schumer, for his part, put Republicans on notice Tuesday that they shouldn't count on Democratic votes for a short-term funding package that includes just some of Democrats' priorities — such as children's health insurance — while leaving immigration for next year.

In the House, lawmakers, including several in the Congressional Hispanic Caucus, privately say they don't see a path to secure a legislative fix for Dreamers before the end of the year. They acknowledge that the sides are now positioning themselves for a fight in January.

AMERICAN OVERSIGHT

House Minority Leader Nancy Pelosi (D-Calif.) touched on dynamics during a private leadership meeting Monday night.

"We need to stick [together] and show that they need us," said one Democratic member with knowledge of the strategy going into January. Republicans "are not going to be able to keep going on with the CRs. ... Then we're at an inflection point in January."

That hasn't stopped some members from making a last-ditch effort to reach a bipartisan agreement, in hopes Democrats can use it as leverage in the House if Republicans need their votes to pass a short-term funding bill later this week.

"I believe that my leadership is gonna close the deal and I have to believe that," said CHC Chair Michelle Lujan Grisham (D-N.M.), noting she's canceled all Christmas travel to stay in Washington and work on a legislative fix.

Reps. Will Hurd (R-Texas) and Pete Aguilar (D-Calif.) are behind one effort that would pair a proposal similar to the DREAM Act with border security, according to several members.

And the Problem Solvers Caucus, a bipartisan group of 48 moderate Democrats and Republicans, is preparing to publicly embrace a specific proposal in the next day or two. A subset of the group has been working for weeks to hammer out an agreement and the entire caucus planned to meet again Tuesday night.

"There's certainly scenarios where this could get done this week. I'm not an expert on how all these pieces could unfold," said Rep. Josh Gottheimer (D-N.J.), a co-chairman of the group. "But everything is clearly on the table, which is why we think it's important we move and move quickly here."

Christmas Comes Early for Trump with Tax Win

By: Kathleen Hunter, 12/20/17

After a year of infighting, frustration and failure, President Donald Trump and his Republicans finally have something to celebrate.

The Senate early this morning passed the largest U.S. tax overhaul in more than three decades with barely a vote to spare, bringing Trump to the brink of his first big legislative win. One more (likely routine) vote in the House and the bill could be on his desk as soon as this afternoon.

The legislation - passed before Christmas, as Trump urged just two months earlier - quiets questions about the fractious party's ability to govern. The measure's repeal of the Obamacare insurance mandate also helps salve the wounds from Republican struggles to repeal the broader law earlier this year.

But the celebration may be short-lived. Congress must quickly pass a spending bill by Friday to avoid a holiday government shutdown.

The new year will bring more spending showdowns, Russia probe revelations and a midterm election in which the Democrats are increasingly favored to take back at least one house of Congress. The tax bill, with most of its benefits going to corporations and the rich, will provide ample fodder for the campaigns ahead.

Congress Discloses 3 More Sexual-Harassment Settlements

By: Lisa Ryan, 12/19/17

The Office of Compliance of the U.S. House of Representatives revealed on Tuesday three additional sexual-harassment settlements it paid out, totaling $115,000, the Hill reports. The disclosure comes just one month after the Washington Postrevealed the Office paid more than $17 million since 1997 to settle 264 workplace complaints (including harassment allegations).

According to the Hill, the three payments were made between fiscal years 2008 through 2012. Yet, the disclosure doesn't include any information about the recipients of the settlements, or from which offices the complaints originated.

Representative Gregg Harper, the chair of the House Administration Committee, released a statement, saying that his group had asked for a breakdown of the $17 million total amount paid to settle the aforementioned complaints. Harper added that the committee still hasn't received all of the requested information.

"We must create a culture within our Capitol Hill community that instills in every employee and employer, new and old, that there is no place for sexual harassment in the halls of Congress," Harper said.

However, on Monday, the Senate's Office of Compliance rejected a bid by Senator Tim Kaine to

AMERICAN OVERSIGHT

release information about that chamber's sexual-harassment settlements, claiming it would violate confidentiality rules. "The [Office of Compliance] shares your concern over the issue of sexual harassment in Congressional workplaces, and we stand ready to work with Members, Committees, and other employing offices to promote awareness and prevention of this problem," the office wrote in a letter, per the Hill.

The Oklahoman

Incentive Review Shows Value of Tax Simplicity

By: Editorial Board, 12/20/17

THIS year, the state's Incentive Evaluation Commission reviewed 12 state economic tax incentives and ultimately voted to repeal five. Revenue increases associated with those repeal votes will be relatively minor. Instead, the biggest impact of the commission's work may be that it reinforces the fact that politicians have a poor record when it comes to identifying and nurturing job creation via targeted tax breaks.

In some instances, breaks have been designed to support companies that are producing fewer jobs than those produced by non-taxpayer supported industries. The commission found this was the case even for the Quality Jobs Act, generally considered one of the state's better business-incentive programs.

The commission's final report notes, "Industries incentivized by Quality Jobs have shown slower growth in employment and annual average pay over the last five years, compared to the State as a whole. Employment in incentivized industries contracted by 2.9 percent, while the State as a whole expanded by 2.5 percent."

The report reveals that Quality Jobs payments during the past five years "have gone to industries lagging behind State growth in employment and annual average pay." In fact, only 27 percent of payments went to establishments with growth in employment, total wages and average annual

AMERICAN OVERSIGHT

wage that exceeded state averages.

The commission reached similar conclusions regarding the Small Employer Quality Jobs program. “The industry group decreased employment over the last five years, as overall State employment expanded.”

Since 1987, Oklahoma has offered a Home Office Tax Credit to insurance companies that establish home or regional home offices in Oklahoma and meet certain employment levels. The Incentive Evaluation Commission's final report notes, “The credit appears to have had little impact on the State's insurance industry employment in recent years. Insurance industry employment in Oklahoma has declined by 4.2 percent since 2001, while neighboring states, most of which do not have a similar home office incentive, have experienced growth ranging from 6 to 30 percent.”

Other credits fared worse, or lacked sufficient data to even measure their worth.

Oklahoma has had a High Impact Quality Jobs program since 1994. The commission found the incentive “has never been used” and the state Department of Commerce “no longer promotes the program on its website due to lack of interest.”

The debate over Oklahoma's capital gain deduction was marred by what the commission deemed a “dearth of data.” The group also reported there is “insufficient data to accurately estimate or verify the total economic or tax revenue impacts of the clean-burning fuel vehicle credit.”

Then there's the Ethanol Fuel Retailer Tax Credit. The commission reports, “Based on the economic and fiscal impact analysis, it appears the annual incentives offered under this program exceed the tax revenue generated by additional household spending by Oklahoma residents.”

The commission's work reinforces the value of tax simplicity. Keeping tax rates low, applying them evenly across the board, and then letting market forces determine individual companies' success or failure works better than depending on politicians to somehow “guide” the process.

John Berrey: Politico got it wrong on Tar Creek

Joplin Globe
John Berry: Chairman of Quapaw Tribe of Oklahoma

As the longtime chairman of the Quapaw Tribe of Oklahoma, I take strong exception to the Dec. 6 article by Politico's Malcom Burnley ("The Environmental Scandal In Scott Pruitt's Backyard"), which showed Burnley to be an accomplished ax-grinder.

This piece indicated that Oklahoma Sen. Jim Inhofe bears significant blame for the complicated nature of the cleanup of the Tar Creek Superfund site located on Quapaw land in Northeast Oklahoma.

Even casual observers know that the complications at Tar Creek existed long before the tenure of Sen. Inhofe. When mining companies discovered lead and zinc ore on Quapaw lands in the early 1900s they were required to acquire mining leases through the federal Bureau of Indian Affairs. Many Quapaw tribal members refused to lease their land to the mining companies. Perhaps not unsurprisingly, the BIA responded by declaring those tribal members "incompetent" and went ahead and executed the mining leases on their behalf.

When the Environmental Protection Agency declared Tar Creek a national priority list Superfund site in 1983, the EPA considered the BIA, along with the mining companies, a "responsible party" because of BIA's participation in leasing the land for mining and its management of mining practices on Indian leases.

For most of the 30-plus years since being declared a responsible party by EPA, and therefore liable for the cleanup, BIA has refused to accept responsibility for the cleanup or provide any cleanup funds. In fact, because of its fear of past and future liability, the BIA fought every effort by the EPA to clean up mine waste on Quapaw tribal lands. This — not anything Sen. Inhofe did or didn't do — is the primary reason that cleanup of Tar Creek has languished for over most of the last 35 years.

In reality, Sen. Inhofe and his staff, including his former chief of staff Ryan Jackson, should get significant credit for ending the deadlock between EPA and BIA, thereby allowing the start of the cleanup of the mountains of heavy metal-laden mine waste (called "chat") that dominate the landscape on Quapaw land. In the early 2000s, Sen. Inhofe, using his influence as chairman of Environment and Public Works Committee in the Senate and working with Quapaw tribal leaders, brought upper management of the EPA and the

AMERICAN OVERSIGHT

Department of the Interior together by facilitating an agreement and sponsoring legislation that would ease fear of liability and allow the EPA to finally begin cleanup of mine waste on tribal lands. Since then, there has been more mine waste cleaned up at Tar Creek than in the previous 30 years combined.

More than once in the article the author states that the Quapaw tribe has been "contracted" to perform cleanup at Tar Creek. This represents a fundamental misunderstanding of the facts and the nature of tribal sovereignty. Under the Superfund law, Indian tribes have the same status as states where Superfund sites are concerned. The EPA cleanup funds that the Quapaw tribe's Environmental Office receives to clean up mine waste on tribal lands are channeled through an inter-agency cooperative agreement — a funding method identical to EPA funding provided to state agencies that participate in Superfund cleanups.

This method of cleanup funding has significant advantages over "contracting" out Superfund cleanup work. By funding a tribe or state agency to perform the work themselves, it allows work to be performed by local entities that know the communities in which they work, not to mention the lower costs that result from avoiding the usual markups of multilayered contractors.

This local control and funding of the cleanups at Superfund sites is consistent with Pruitt's change in the focus of the Superfund program nationwide.

It should be noted that Tar Creek is the first Superfund site in the nation where an Indian tribe has been given the lead by the EPA in site cleanup. Some believe Scott Pruitt is eyeing U.S. Senate campaign from his seat as EPA head

By: Randy Krehbiel, 8/9/17

Former Oklahoma Attorney General Scott Pruitt's foray into the federal bureaucracy as Environmental Protection Agency administrator doesn't seem to have diminished speculation that his ultimate goal is the U.S. Senate.

Although he remains mum about his long-range plans, Pruitt has long been seen as a potential successor to U.S. Sen. Jim Inhofe, who would be up for re-election in 2020, when he turns 86.

Inhofe has not said whether he'll seek another term, but he has always been very complementary of Pruitt and, publicly at least, seems to regard Pruitt as a worthy protege.

In a piece published Wednesday morning, Politico suggests some of Pruitt's EPA initiatives are regarded as political theater. His proposed televised debates on climate change are viewed with particular skepticism, according to the piece.

"The man's running for Senate (in 2020)," says David Bookbinder of the Niskanen Center, a libertarian-leaning policy institute that favors federal regulation of greenhouse gases. "Everything he says is calculated toward securing the Republican nomination in Oklahoma and

AMERICAN OVERSIGHT

then winning the general election there."

Pruitt has been and continues to be the subject of intense scrutiny in Washington. Most recently, reporters have been reexamining Pruitt's handling five years ago of a state auditor and inspector's report on a trust created to administer relocation of residents in the area of Tar Creek in Ottawa County.

Pruitt, who was attorney general at the time, took the report to the state's multi-county grand jury, but no action was taken. Pruitt subsequently refused to release the report, saying he believed it might cast private citizens in an unfavorable light.

At the time, Auditor and Inspector Gary Jones, now a candidate for governor, disagreed with Pruitt.

More recently, as a result of Open Records Act requests for the audit, Jones' office asked current Attorney General Mike Hunter for guidance on the matter.

In a letter dated Aug. 3, Senior Deputy Attorney General Tom Gruber told Jones' office "this audit shall remain a confidential criminal investigatory file in the Office of the Attorney General and will not be released."

A long record in public office can be fertile ground for political foes. The Politico piece says that while Pruitt's energy allies want a more favorable regulatory environment, they don't necessarily want a showdown on environmental science, because that's a fight they could lose.

And if they lose, so does Scott Pruitt.

Brietbart: Exclusive—Talgo: EPA Administrator Scott Pruitt Should Be Applauded, Not Attacked

Environmental Protection Agency (EPA) Administrator Scott Pruitt has unquestionably been the most effective official in President Donald Trump's administration. He has laid waste to Barack Obama's radical environmental legacy, which is why Democrats, the mainstream media, academia, environmentalists, and left-wing advocacy groups are in full-panic mode. Out of desperation, these zealots (aided by the media) are resorting to unwarranted character assaults to challenge Pruitt's integrity and diminish his authority.

AMERICAN OVERSIGHT

Gulf Live: EPA Administrator Signs $107.6 Million Memorandum to Clean Mississippi Phosphates Site

The Environmental Protection Agency administrator Scott Pruitt signed an Action Memorandum for $107.6 million on Wednesday, accelerating the cleanup of the former Mississippi Phosphates Corporation (MPC) Site in Pascagoula. In January, Pruitt and his team added MPC to its Superfund Priorities List after the agency announced in August 2017 their intentions to recommend the site for the list because of the environmental hazard it posed to marine and human life in the City of Pascagoula. The Action Memorandum signed Wednesday selects a $71.6 million cleanup that will take place from 2018 through 2020, plus $36 million for ongoing wastewater treatment during the three-year cleanup period.

Daily Caller: Associated Press Publishes Misleading Headline on Scott Pruitt's Travel Arrangements

The Environmental Protection Agency is pushing back against The Associated Press' reporting on Administrator Scott Pruitt's private travel. The AP released a report on Wednesday titled: "EPA chief sat in coach when not flying on taxpayer's dime." The headline — and the opening lede — suggested that the leader of the EPA makes more economical decisions when taking personal flights, as opposed to his travel when conducting official business. Pruitt has received criticism for flying first class on the taxpayers' dime, an arrangement he says is made for security reasons. The AP story centered on how Pruitt flew coach on Southwest Airlines when he made personal trips to Oklahoma in August and September.

Tulsa World: Scott Pruitt Showed Penchant for Travel, Drivers Even Before Being Named EPA Head

Scott Pruitt's penchant for travel and concerns about security were notable even before he became head of the Environmental Protection Agency, according to newly obtained records that show that as Oklahoma's attorney general he frequently traveled out-of-state for appearances before conservative groups and used an office investigator as a driver. As Oklahoma's top prosecutor from 2011 to 2016, Pruitt was raising his profile nationally as a conservative in favor of rolling back regulation and federal authority.

Indiana to Get EPA Money for Lead Cleanup, Water Upgrades

By: David Schultz, 4/19/18

The EPA is giving the Hoosier State a loan of nearly half a billion dollars to upgrade its water systems, with plans to spend additional money to clean up a lead-contaminated site in the northwestern part of the state.

EPA Administrator Scott Pruitt on April 19 visited Whiting, Ind., home of a former Federated Metals plant that is now a Superfund site. Pruitt said his agency would spend $1.7 million to

AMERICAN OVERSIGHT

address lead contamination at the former copper, lead, and zinc smelter.

Pruitt also highlighted a $436 million loan from the Environmental Protection Agency to Indiana through the agency's Water Infrastructure Finance and Innovation Act program, which provides low-cost financing for drinking water and wastewater infrastructure upgrades. The agency first announced last summer it had accepted Indiana's application for this loan as part of its first-ever round of financing under the program established in 2014.

The EPA said in an April 19 statement that the money would flow through to the state "once all needed processes are complete." The loan cleared a preliminary EPA environmental review earlier this year. This loan is one of 12 that the EPA granted through its first $2.3 billion round of financing through this program.

The agency's press office did not immediately respond to Bloomberg Environment's request for comment on what specific actions the EPA took on April 19 on the Indiana loan or about whether the loan has been finalized.

Pruitt Talks to Residents

The announcement came after Pruitt personally visited Whiting, which is on Lake Michigan, and spoke with people living near the contaminated Federated Minerals site.

"There was a woman who was a property owner waiting for them," Thomas Frank, an activist with the East Chicago, Ind.-based Community Strategy Group, an environmental justice advocacy coalition, told Bloomberg Environment. "Apparently her property tested high in lead and she was showing them where the tests had occurred,"

Pruitt was at the Indiana site about 10 or 15 minutes, Frank said.

Pruitt also made a stop lasting less than 20 minutes at the EPA's Region 5 headquarters in Chicago, Mike Mikulka, president of American Federation of Government Employees Local 704 union, told Bloomberg Environment.

Exclusive—Talgo: EPA Administrator Scott Pruitt Should Be Applauded, Not Attacked

By: Chris Talgo, 4/19/18

Environmental Protection Agency (EPA) Administrator Scott Pruitt has unquestionably been the most effective official in President Donald Trump's administration.

He has laid waste to Barack Obama's radical environmental legacy, which is why Democrats, the mainstream media, academia, environmentalists, and left-wing advocacy groups are in full-panic mode. Out of desperation, these zealots (aided by the media) are resorting to unwarranted character assaults to challenge Pruitt's integrity and diminish his authority.

The disingenuousness of these attacks is made evident by the silence of these same groups when several Obama-era federal agencies engaged in illegal and/or unethical activities. The fact very few Americans know the name "Richard Windsor" is proof of selective outrage by "good government" groups and the media. (Windsor is the name of a fake EPA employee created by former EPA head Lisa Jackson to skirt public-records laws.)

Thankfully, Pruitt is not letting ad hominem attacks distract him from his mission of implementing a "back to basics" agenda for EPA. Unlike most of his predecessors at EPA and his opponents on the left, Pruitt believes, "We can and we will achieve clean air and clean water and we will also have strong economic growth and job creation at the same time."

To accomplish these long-overdue reforms, Pruitt has focused on and been incredibly successful at implementing a "three E's" strategy: concentrating on the environment, economy, and engagement with state and local governments.

1. **Protecting the Environment**

AMERICAN OVERSIGHT

2.

Under Obama, the EPA became a highly politicized agency, one that had been captured by radical environmental groups. When Pruitt took office, he vowed to refocus the agency on its core mission: protecting the environment and staying out of politics.

In May 2017, Pruitt created the Super Fund Task Force "to provide recommendations for improving and expediting site cleanups and promoting redevelopment." As of this writing, EPA has already completed seven Super Fund site clean-ups.

Additionally, EPA is prioritizing drinking water problems, including the egregious lead problem that arose during the Obama era in Flint, Michigan.

2. **Sensible regulations that encourage economic growth**

Obama's two EPA administrators, Jackson and Gina McCarthy, instituted an unprecedented era of unnecessary, costly, burdensome rulemaking, undermining personal property rights and economic growth.

Fortunately, Pruitt has put an end to this. His highlights, which are many, include announcing that the United States will pull out of the Paris climate accord.

In 2016, Obama pushed the United States into the Paris climate agreement, which analysts found would reduce U.S. gross domestic product by more than $2.5 trillion and result in an average annual job loss of nearly 400,000 by 2035 compared to jobs projections without the accord.

Pruitt has been a staunch advocate of withdrawing from this fake "treaty," and his support for the idea surely contributed to Trump's decision to pull back from the Paris accords.

In October 2017, Pruitt proposed repealing Obama's Clean Power Plan, a set of regulations that economists estimated would cost U.S. taxpayers $40 billion per year and produce no effect on global carbon dioxide levels.

AMERICAN OVERSIGHT

Also in October, Pruitt issued a directive to end EPA's "sue and settle" practices, a scheme in which radical environmental groups sue EPA to impose their agenda and EPA chooses not to fight the lawsuit in order to satisfy radical environmentalists' demands.

Putting the interests of ordinary Americans ahead of special-interest groups, Pruitt declared in October 2017 "the days of regulation through litigation are over."

In another measure designed to protect consumers, Pruitt announced in March 2018 the EPA will no longer use "secret science" in crafting regulations. Going forward, EPA rulemaking will be transparent and based on good data—not ideology.

Most recently, Pruitt suspended for review the onerous Corporate Annual Fuel Economy (CAFE) standards Obama's regime rushed through near the end of his final term. These burdensome regulations mandated unachievable fuel economy standards and would have forced carmakers to produce vehicles Americans don't want—and for an extra $3,800 per vehicle and negligible environmental benefits.

3. **Engaging with state and local partners**

For decades, EPA has usurped power from state and local governments. Pruitt is reversing this disturbing trend by instituting "cooperative federalism." Under this program, EPA will coordinate with state and local governments, rather than dictating edicts. His track record so far includes his revision of the definition and implementation of Obama's 2015 Waters of the United States rule (WOTUS), which was overly broad and abusive. WOTUS effectively granted to the federal government jurisdiction over every puddle and tiny body of water on private land.

"EPA is restoring states' important role in the regulation of water," Pruitt stated when announcing the end of the rule.

EPA is also establishing Compliance Assistance Centers to "help businesses, colleges and universities, local governments, tribes and federal facilities understand and comply with environmental requirements and save money," and it's introducing Next Generation Compliance standards to "reduce costs and saves time and resources, while improving compliance."

AMERICAN OVERSIGHT

Under Pruitt, the EPA is no longer imposing onerous rules that stifle economic growth and bankrupt the country. Instead, Pruitt is enacting levelheaded regulations that strike a proper balance between protecting the environment and maintaining consumer freedom.

After little more than a year on the job, Pruitt has transformed EPA's culture and restored its mission. The EPA Swamp has been substantially drained, a huge setback for power-grabbing leftists. And it's primarily for that reason the left and mainstream media have succumbed to attacking Pruitt's character. Just imagine how apoplectic they will get if Pruitt is allowed to continue his record of success in the years ahead!

Gulf Live

EPA Administrator Signs $107.6 Million Memorandum to Clean Mississippi Phosphates Site

By: Tyler Carter, 4/19/18

The Environmental Protection Agency administrator Scott Pruitt signed an Action Memorandum for $107.6 million on Wednesday, accelerating the cleanup of the former Mississippi Phosphates Corporation (MPC) Site in Pascagoula.

In January, Pruitt and his team added MPC to its Superfund Priorities List after the agency announced in August 2017 their intentions to recommend the site for the list because of the environmental hazard it posed to marine and human life in the City of Pascagoula.

The Action Memorandum signed Wednesday selects a $71.6 million cleanup that will take place from 2018 through 2020, plus $36 million for ongoing wastewater treatment during the three-year cleanup period.

AMERICAN OVERSIGHT

"In just over a year, EPA has taken multiple important actions to accelerate the remediation of the Mississippi Phosphates Superfund Site," Pruitt said. "This memo reflects my commitment to addressing Superfund sites as quickly and safely as possible to ensure human health and economic activity in the surrounding areas are fully protected."

The cleanup plan identified in the Action Memorandum focuses on the closure of the East Gypsum Stack and the North Ponds at the West Gypsum Stack. The cleanup will eliminate storage of more than 500 million gallons of contaminated water on site and reduce the volume of water requiring treatment by an estimated 98 percent.

Design of the closure system is underway. EPA is evaluating the possible use of local dredge spoil to cap and close the East Gypsum Stack.

In response to comments received during the public comment period, EPA is also evaluating the use of engineered geosynthetic turf products as an alternative cap/cover system in its design.

The MPC Site is a former diammonium phosphate fertilizer plant that began operation in the 1950s. The facility ceased operations in December 2014 under Chapter 11 bankruptcy protection, leaving more than 700,000,000 gallons of acidic, nutrient-rich wastewater stored at the facility.

The wastewater--if improperly discharged--may be toxic to fish and other forms of marine life and can also cause algal blooms. Previous releases of untreated wastewater from the site (before EPA took over wastewater treatment operations) resulted in fish kills.

EPA currently oversees wastewater treatment at a rate of approximately 2-4 million gallons per day--at a cost of over $1 million per month--due to the high volume of wastewater requiring treatment. EPA has expended approximately $17 million to treat wastewater at the site.

EPA assumed control of wastewater treatment operations at the former MPC fertilizer facility

AMERICAN OVERSIGHT

once the MPC Environmental Trust, which owns the property, ran out of funds in February 2017.

"Pascagoula has lived with this catastrophic issue for years with no response," Mayor Dane Maxwell said. "Since President Trump took office and under Administrator Pruitt not only have we had a response, but it has been from the highest levels. Making Mississippi Phosphates cleanup a priority is very important for the entire Gulf Coast."

Daily Caller

http://dailycaller.com/2018/04/19/associated-press-scott-pruitt-travel/

Associated Press Publishes Misleading Headline on Scott Pruitt's Travel Arrangements

By: Jason Hopkins, 4/19/18

The Environmental Protection Agency is pushing back against The Associated Press' reporting on Administrator Scott Pruitt's private travel.

The AP released a report on Wednesday titled: "EPA chief sat in coach when not flying on taxpayer's dime." The headline — and the opening lede — suggested that the leader of the EPA makes more economical decisions when taking personal flights, as opposed to his travel when conducting official business.

Pruitt has received criticism for flying first class on the taxpayers' dime, an arrangement he says is made for security reasons. The AP story centered on how Pruitt flew coach on Southwest Airlines when he made personal trips to Oklahoma in August and September.

AMERICAN OVERSIGHT

However, there is one major detail included about Southwest Airlines: They do not offer first-class travel. This detail was included in the body of the AP article, but the headline and angle of the report framed Pruitt as a hypocrite when it comes to personal travel.

"Despite their misleading headline, the Associated Press knowingly reported that that there are no premium-class seats on Southwest Airlines," read a Wednesday statement from the EPA. "The fact is: Administrator Pruitt consistently follows the same security measures, which is not about sitting in first class but sitting near the front of the plane. It's impossible to fly first-class on Southwest Airlines, however Administrator Pruitt always sat in the first few rows of the aircraft."

This was not the only detail the EPA took issue with. The AP claimed on Twitter that it confirmed their story with the agency.

However, EPA spokesperson Jahan Wilcox said this tweet is false and that the agency never confirmed their report. "The same security procedures are followed whether Administrator Pruitt is on official or personal travel," the official statement provided to the AP read. The statement neither confirmed nor denied the story.

Pruitt, who has racked up thousands of dollars in travel expenses since taking the helm of the EPA, has received immense criticism for taking first-class flights on taxpayer dollars. Democrats and other Pruitt opponents have used news of his expensive flights to push for his ouster. The EPA, however, maintains more expensive flights are necessary for his safety.

Pruitt has been the target of aggression and profane language at airports since leading the agency.

"He was approached in the airport numerous times, to the point of profanities being yelled at him and so forth," Henry Barnet, director of the EPA's Office of Criminal Enforcement, told Politico in a Feb. 15 report. "We felt that based on the recommendation from the team leader, the special agent in charge, that it would be better suited to have him in business or first class, away from

AMERICAN OVERSIGHT

close proximity from those individuals who were approaching him and being extremely rude, using profanities and potential for altercations and so forth."

Tulsa World

http://www.tulsaworld.com/news/usworld/scott-pruitt-showed-penchant-for-travel-drivers-even-before-being/article_4aa07e53-b8ff-5241-a223-58d1829655d2.html

Scott Pruitt Showed Penchant for Travel, Drivers Even Before Being Names EPA Head

By: Ellen Knickmeyer and Sean Murphy, 4/20/18

Scott Pruitt's penchant for travel and concerns about security were notable even before he became head of the Environmental Protection Agency, according to newly obtained records that show that as Oklahoma's attorney general he frequently traveled out-of-state for appearances before conservative groups and used an office investigator as a driver.

As Oklahoma's top prosecutor from 2011 to 2016, Pruitt was raising his profile nationally as a conservative in favor of rolling back regulation and federal authority.

Records obtained by The Associated Press show Pruitt traveled extensively as Oklahoma's attorney general, taking 18 out-of-state trips in 2015 and 2016, for example, including 11 to Washington, D.C. Although some travel expenses were reimbursed by conservative think tanks where Pruitt spoke, records show no sign of reimbursement for several trips involving appearances before them.

Immediately after taking office as attorney general, Pruitt started using a full-time driver who chauffeured him in a large black SUV from his home in Tulsa to the office in Oklahoma City, about 90 miles away.

Pruitt's daily calendars show the driver — variously shown on the records as "driver" or "agent" — was often an office investigator, a licensed law enforcement officer who typically investigates crimes for the agency.

AMERICAN OVERSIGHT

"It appears he created his own security detail," said Gary Jones, Oklahoma's state auditor and a fellow Republican.

As EPA administrator, Pruitt has been under intense scrutiny since it was first revealed last month that he had stayed last year in a bargain-priced Capitol Hill condo tied to a fossil-fuels lobbyist. Multiple investigations have been launched by government watchdogs and congressional committees looking into luxury travel expenses, outsized security spending and massive raises awarded to political appointees.

Lincoln Ferguson, a former spokesman for the attorney general who now serves as a senior adviser to him at the EPA, said if Pruitt's out-of-state travel was strictly for political purposes, it would have been paid for by campaign funds. But travel records show the trips were arranged through a state-contracted travel agency, and few show any reimbursement was made.

In Oklahoma, Pruitt routinely made the three-hour commute from his home in Tulsa to the state Capitol in Oklahoma City during the working day, according to the calendars.

The entry for Dec. 7, 2015, for example, shows the entry: "8:15 to 9:45, depart Tulsa for OKC" and "3:30-5, depart OKC for Tulsa."

That was despite Pruitt expanding his office's Tulsa branch during his time. The AP reported in December 2016 that the move to bigger, pricier offices in Tulsa were part of a 40 percent increase in his office's expenses as attorney general. Pruitt also added nearly 60 employees to the attorney general's office.

By contrast, Pruitt's predecessor, Democrat Drew Edmondson, who held the attorney general post for 16 years, said he typically used a four-door sedan and drove himself to events.

Ferguson, the senior adviser to Pruitt, said "there was no wasted time" on Pruitt's commutes between Tulsa and Oklahoma City.

AMERICAN OVERSIGHT

"He was working, reviewing documents, on the phone," Ferguson said.

Overall spending on travel by Pruitt's office averaged about $270,000 a year in his last four years as Oklahoma's attorney general, up 26 percent from his predecessor's final year in office. The figures do not include a total for Pruitt's trips alone. The attorney general's office spent $201,000 on travel during his predecessor's last year in the office.

The calendars are heavily redacted and entire days are blacked out.

But the records do show Pruitt frequently traveled to Washington to speak to groups including the Federalist Society; the Club for Growth, a free-enterprise advocacy group; and an anti-abortion rally. He also made similar appearances elsewhere, such as one before the small-government FreedomWorks group in Cleveland on "Battling the Regulatory State."

"If it's not state-related, then the state should not be responsible for" the cost, said Jones, the state auditor. "You can't use any public assets for personal or political reasons."

Records show many of the trips occurred during the workweek, when Pruitt was drawing a state salary of $132,000. Oklahoma broadly bans first-class tickets for state employees. The travel records show only one first-class flight for Pruitt, with a scrawled note on it showing Pruitt's campaign paid for it.

Edmondson, who is now running for governor, said his travel expenses as attorney general typically covered national and regional conventions of attorneys general.

"I think you'll find that his out-of-state travel would far exceed any other attorney general" in Oklahoma, said former Gov. David Walters, a Democrat, who recalled Pruitt speaking before local clubs on topics such as the Obama administration, rather than crime or consumer fraud in Oklahoma.

AMERICAN OVERSIGHT

Conservative groups hosting Pruitt appeared to reimburse most of Pruitt's flights and some other direct state travel expenses after 2015, and some beforehand.

But on one trip in January 2016, Pruitt billed taxpayers more than $1,000 for a trip to Washington in which he held separate meetings with executives of three conservative think tanks: the APP Foundation, The Federalist Society and Club for Growth. There was no record of reimbursement for that trip. Three weeks later, Pruitt spent the weekend in California for a dinner and a speech to The Federalist Society, which reimbursed the state for his travel.

Associated Press

https://apnews.com/e29d5563fc0c45caa4faa6b3749405a6/Comey-memo:-Trump-complained-about-Flynn's-'judgment-issues

In Comey memos, Trump fixates on 'hookers,' frets over Flynn

By: Mary Clare Jalonick, Eric Tucker, and Chad Day, 4/20/18

In a series of startlingly candid conversations, President Donald Trump told former FBI Director James Comey that he had serious concerns about the judgment of a top adviser, asked about the possibility of jailing journalists and described a boast from Vladimir Putin about Russian prostitutes, according to Comey's notes of the talks obtained by The Associated Press on Thursday night.

The 15 pages of documents contain new details about a series of interactions with Trump that Comey found so unnerving that he chose to document them in writing. Those seven encounters in the weeks and months before Comey's May 2017 firing include a Trump Tower discussion about allegations involving Trump and prostitutes in Moscow; a White House dinner at which Comey says Trump asked him for his loyalty; and a private Oval Office discussion where the ex-FBI head says the president asked him to end an investigation into Michael Flynn, the former White House national security adviser.

AMERICAN OVERSIGHT

The documents had been eagerly anticipated since their existence was first revealed last year, especially since Comey's interactions with Trump are a critical part of special counsel Robert Mueller's investigation into whether the president sought to obstruct justice. Late Thursday night, Trump tweeted that the memos "show clearly that there was NO COLLUSION and NO OBSTRUCTION."

The president also accused Comey of leaking classified information. The memos obtained by the AP were unclassified, though some portions were blacked out as classified. Details from Comey's memos reported in news stories last year appear to come from the unclassified portions.

In explaining the purpose of creating the memos, which have been provided to Mueller, Comey has said he "knew there might come a day when I would need a record of what had happened" to defend not only himself but the FBI as well.

The memos cover the first three months of the Trump administration, a period of upheaval marked by staff turnover, a cascade of damaging headlines and revelations of an FBI investigation into potential ties between the Trump campaign and Russia. The documents reflect Trump's uneasiness about that investigation, though not always in ways that Comey seemed to anticipate.

In a February 2017 conversation, for instance, Trump told Comey how Putin told him, "we have some of the most beautiful hookers in the world" even as the president adamantly, and repeatedly, distanced himself from a salacious allegation concerning him and prostitutes in Moscow, according to one memo.

In another memo, Comey recounts how Trump at a private White House dinner pointed his fingers at his head and complained that Flynn, his embattled national security adviser, "has serious judgment issues." The president blamed Flynn for failing to alert him promptly to a congratulatory call from a world leader, causing a delay for Trump in returning a message to an official whose name is redacted in the documents.

"I did not comment at any point during this topic and there was no mention or acknowledgment of any FBI interest in or contact with General Flynn," Comey wrote.

AMERICAN OVERSIGHT

By that point, the FBI had already interviewed Flynn about his contacts with the Russian ambassador, Sergey Kislyak, and the Justice Department had already warned White House officials that they were concerned Flynn was vulnerable to blackmail.

Flynn was fired Feb. 13, 2017, after White House officials said he had misled them about his Russian contacts during the transition period by saying that he had not discussed sanctions. The following day, according to a separate memo, Comey says Trump cleared the Oval Office of other officials, encouraged him to let go of the investigation into Flynn and called him a good guy. Flynn pleaded guilty to lying to the FBI and is now cooperating with Mueller's investigation.

The memos reveal that days before Flynn's firing, then-White House chief of staff Reince Priebus asked Comey if Flynn's communications were being monitored under a secret surveillance warrant.

"Do you have a FISA order on Mike Flynn?" Priebus asked Comey, according to the memos, referring to an order under the Foreign Intelligence Surveillance Act.

Comey said he "paused for a few seconds and then said that I would answer here, but that this illustrated the kind of question that had to be asked and answered through established channels."

Comey's response is redacted on the unclassified memos.

The memos also show Trump's continued distress at a dossier of allegations — compiled by an ex-British spy whose work was funded by the Democratic National Committee and the Clinton campaign — examining potential ties between him and his aides and the Kremlin. Comey writes how Trump repeatedly denied to him having been involved in an encounter with Russian prostitutes in a Moscow hotel.

AMERICAN OVERSIGHT

"The President said 'the hookers thing' is nonsense," Comey writes, noting that Trump then related the conversation with Putin about the "most beautiful hookers." Comey says Trump did not say when Putin had made the comment.

The documents also include the president's musings about pursuing leakers and imprisoning journalists. They also provide insight into Comey's personal and professional opinions. He judges the administration's travel ban to be legally valid, and he takes a swipe at former Attorney General Loretta Lynch, calling her predecessor, Eric Holder, "smarter and more sophisticated and smoother."

The memos were provided to Congress earlier Thursday as House Republicans escalated criticism of the Justice Department, threatening to subpoena the documents and questioning officials.

In a letter sent to three Republican House committee chairmen Thursday evening, Assistant Attorney General Stephen Boyd wrote that the department was sending a classified version of the memos and an unclassified version. The department released Boyd's letter publicly but did not release the memos. The chairmen issued a statement late Thursday saying the memos show that Comey clearly never felt threatened, and Trump didn't obstruct justice.

Justice officials had allowed some lawmakers to view the memos but had never provided copies to Congress. Boyd wrote that the department had also provided the memos to several Senate committees.

Boyd wrote in the letter that the department "consulted the relevant parties" and concluded that releasing the memos would not adversely affect any ongoing investigations. Mueller is investigating potential ties between Russia and Trump's 2016 campaign as well as possible obstruction of justice by the president.

Comey is on a publicity tour to promote his new book, "A Higher Loyalty." He revealed last year that he had written the memos after conversations with Trump.

AMERICAN OVERSIGHT

He said in an interview Thursday with CNN that he's "fine" with the Justice Department turning his memos over to Congress.

"I think what folks will see if they get to see the memos is I've been consistent since the very beginning, right after my encounters with President Trump, and I'm consistent in the book and tried to be transparent in the book as well," he said.

Trump hires Giuliana, Two Other Attorneys Amid Mounting Legal Turmoil Over Russia

By: Robert Costa, Josh Dawsey and Rosalind Helderman, 4/19/18

Former New York mayor Rudolph W. Giuliani and two other former federal prosecutors joined President Trump's legal team Thursday following weeks of turbulence and struggles to find attorneys who would agree to represent the president in the ongoing federal probe into Russian election interference.

The reshuffling comes at a particularly tense juncture for Trump, who aides said is increasingly frustrated by special counsel Robert S. Mueller III's investigation and with the senior officials at the Justice Department.

The entry of Giuliani, an experienced attorney with a combative reputation, immediately raises questions about how Trump will engage with Mueller and the leadership at Justice. Some Trump advisers are concerned that the president could use his -executive authority to close or diminish the special counsel probe, which has spawned a parallel investigation in New York targeting his personal attorney.

AMERICAN OVERSIGHT

"I'm doing it because I hope we can negotiate an end to this for the good of the country and because I have high regard for the president and for Bob Mueller," Giuliani said in an interview Thursday.

Trump said in a statement that Giuliani "wants to get this matter quickly resolved."

In recent days, the president has been regularly venting and speculating to aides about his legal status and the expected timeline for the Russia investigation to end, according to associates briefed on the discussions.

Rudolph W. Giuliani was an ardent supporter of President Trump during the 2016 campaign, and the former New York mayor was considered for the post of attorney general. (Mike Segar/Reuters)

Trump also loudly and repeatedly complained to several advisers earlier this week that former FBI director James B. Comey, former deputy FBI director Andrew McCabe and former Democratic presidential nominee Hillary Clinton, among others, should be charged with crimes for misdeeds alleged by Republicans, the associates said.

Although White House officials said Thursday that Trump has not called Justice Department officials or taken any formal action, the persistent grousing has made some advisers anxious, according to two people close to the president. A publicity tour by Comey to promote his book critical of Trump, "A Higher Loyalty," has attracted particular attention from the president, who has disparaged Comey publicly and privately.

Trump also complained this week about Supreme Court Justice Neil M. Gorsuch, saying the judge had proved too liberal in recent cases, according to administration officials who heard about the complaints. Associates said he was incensed that Gorsuch had voted against the administration on an immigration case and said it renewed his doubts that Gorsuch would be a reliable conservative. One top Trump adviser played down the comments as unhappiness with Gorsuch's decision rather than with Gorsuch broadly.

Giuliani, 73, brings a familiarity with several of the legal fronts that Trump is navigating. He is a former associate attorney general and a former U.S. attorney for the Southern District of New

AMERICAN OVERSIGHT

York, which is the office overseeing an investigation of Trump's personal attorney, Michael Cohen.

Trump counsel Jay Sekulow said Thursday that former federal prosecutors Jane Serene Raskin and Marty Raskin, a couple who manage a Florida-based law firm, have also agreed to join the legal team.

Giuliani is certain to come under intense scrutiny for his role. His own pre-election activities two years ago have been the subject of criticism from Democrats, especially television interviews in which he suggested he had sources providing him inside information about the FBI's investigation of Clinton's private email server when she was secretary of state.

A Justice Department Inspector General report on the department's handling of the Clinton investigations is expected to be released in coming weeks and will probably include results of leak investigations regarding the Clinton probe.

Numerous other challenges face the attorneys who will work alongside Sekulow and counsel Ty Cobb — who have functioned as Trump's legal nucleus for weeks following the resignation of John Dowd, a legal veteran and the team's former leader. Dowd stepped down in March amid clashes over strategy and whether Trump should sit for a voluntary interview with Mueller. The legal team has often been beset by infighting.

"The big question is, how's he going to play with everybody else?" said a lawyer involved with the investigation who was not authorized to speak publicly. "Will he be combative Rudy, or will he play well with Mueller's team? Will he try to walk . . . back from the brink and answer the big question, which is whether the president will sit for an interview? And will Trump listen to him?"

Giuliani declined to say whether Trump has made a final decision on whether to sit for an interview with federal investigators. Trump has been mulling it for weeks, moving away from the idea after the home, offices and hotel room of Cohen were raided this month. Trump reacted angrily, calling it "disgraceful."

AMERICAN OVERSIGHT

"It's too early for me to say that," Giuliani replied, when asked whether a Trump interview is unlikely to happen.

Giuliani also declined to discuss whether Deputy Attorney General Rod J. Rosenstein, who has been under fire from conservatives and oversees the Russia probe, could be fired by the president in the coming weeks.

"I'm not involved in anything about those issues. My advice on Mueller has been this: He should be allowed to do his job. He's entitled to do his job."

Giuliani said he formalized his decision in recent days, including over dinner last week at Trump's Mar-a-Lago resort in Florida. Giuliani and Trump spoke Thursday about the legal plan moving forward, along with Sekulow, whom he has known for years and called a friend. He added that he and Cobb also spoke, on Wednesday.

Giuliani — who will take a leave from his law firm, Greenberg Traurig, and is in the midst of a divorce from his third wife — said he would spend a "great deal of time" in Washington working with Trump but would continue to live in New York. He has been frequently been seen holding court at the Trump International Hotel in Washington, dining and drinking with friends and browsing for gourmet cigars.

Trump had considered Giuliani for attorney general and has said in recent weeks he needs a New York-based attorney. Many leading white-collar lawyers, such as former solicitor general Theodore Olson, have declined Trump's entreaties, often citing conflicts or expressing unease about the high-profile case.

Trump is also known to be a difficult client who does not always listen to his attorneys' advice, according to lawyers who know him. And Giuliani, once a top adviser, grew frustrated with his treatment during the transition and had receded from the inner circle.

As he has closely monitored cable-news programs chronicling his presidency and the Mueller

AMERICAN OVERSIGHT

probe, Trump has swatted away the notion that he cannot attract prominent attorneys. He has also spoken about his desire for a bolstered team and wondered aloud about the damage that Cohen's legal proceedings could bring, according to the associates briefed on the discussions, who requested anonymity to talk about them.

Giuliani's arrival is part of a broader shift in Trump's inner circle toward the core allies and brusque and brutal style that defined his outsider presidential campaign and his business career. Beyond Mueller, aides said everyone and everything around Trump feels liable to become a target for his wrath as he grapples with difficult issues at home and abroad, in Syria and North Korea.

"What we've been seeing with the president is that he is picking A-level people that he knows are experienced but also know him well," said Trump ally Christopher Ruddy, the president and CEO of Newsmax Media, a conservative outlet. "One of the problems in the first year was that people didn't work out because they didn't know him and they didn't have experience for the position."

Subject: Comment on employee survey results
Efficient EPA Survey Results_Final REDACTED B6 PW.xlsx

Hello all,

I'm writing a story based on results released to me under FOIA of an anonymous employee survey EPA conducted in May on ways to better achieve the agency's mission. With more than 1,400 responses, I'll be focusing on the broad themes raised after we conducted a search for key terms in the responses — budget shortfalls, Superfund, state outreach, teleworking, etc. I also plan to highlight some of the smaller number of answers that criticized the political leadership of EPA and the president.

The survey was announced in the staff-wide May 2 email from Ryan Jackson titled "Creating a More Efficient, Effective and Accountable EPA." I've attached the responsive records for your reference.

In addition to any comment EPA may want to provide on the results, I wanted to ask if you can tell me how the results have been or will be used — to inform new streamlining initiatives, advocate for more funding, etc.

We plan to publish a story on the results late this afternoon.

Thank you,

Alex Guillén

2	1	5/2/2017	Why are there 4 SES people on the Environmental Appeals Board? Plus a staff of 12. **[REDACTED B6]** did this job for many years as the Chief Judicial Officer with 2 attorneys and one assistant. The docket is small and it appears this has become an SES dumping ground for the likes of **[REDACTED B6]**. YOU WANT TO STREAMLINE? START HERE!	Stop the "Mother May I approach." Clean up CONFUSING REGULATIONS. MAKE STATES REAL PARTNERS.				
3	2	5/2/2017	Nothing I can think of	More money for travel to meet with states and tribal members	Continue what I'm doing - phone calls, webinars, and travel	Holding more webinars. To do that - more training on how to conduct a webinar	Provide apps onto government phones and IPADs	Get the word out onto our website of our good work
4	3	5/2/2017	PNET - I've worked for other agencies that do not have this level of approval for purchases					
5	4	5/2/2017	Limited ability to connect with the people we are charged with protecting.	More face to face time with tribes, states and community.	See #2 above.	Getting closer to community so that we know what protections are understood and valued.	It's obvious	Again, more collaboration with sister agencies to identify synergies which will maximize our efficiencies and effectiveness.
6	5	5/2/2017	I have not identified any administrative requirements, management procedures, or organization processes that prevent me from doing my job.	EPA grants to states, tribes, and local communities are vital to forming these partnerships. There does not seem to be a guarantee that these groups will get this support from any other area of the government without sacrificing other state priorities	Ensuring EPA grants to states, tribes, and local communities are maintained are very important. Continued support for EPA public involvement is also very important as EPA has the technical knowledge and history of working with the public and is best positioned to offer customer service.	It is important to keep all current EPA offices open since closing them would result in huge inefficiencies in working with state partners. Closing offices would burden communities, particularly poor and minority neighborhoods.	Increasing telecommunication capabilities (virtual meetings/conferences).	Understanding that shared responsibility often means one party cannot replace another. Instances were responsibilities were completed shifted to another agency had resulted in issues when states do not fully understand federal regulations. The EPA needs to maintain oversight roles even when there are state-authorized programs.
7	6	5/2/2017	Hire people with science degrees who actually UNDERSTAND science. Fire all of #45's team.	SEE #1	For the new administration to quit being racist and pretending to care. HIRE PEOPLE WHO CARE ABOUT THE COMMUNITIES WE SERVE.	It doesn't matter because you don't really give a shit.	Does the new staff know what accountability is? If so, get ready to poison more people!	Quit being morons
8	7	5/2/2017	The current Administration should avoid the appearance of denying the fact that humans are a primary contributor to climate disruption.	Adopt the most effective means for addressing climate disruption.	Ask these various entities how EPA should address climate disruption.	EPA staff should receive extensive education about the dramatic impacts of climate disruption.	Reestablish EPA's climate change (disruption) webpage.	Expand the cooperation between EPA and other Agencies/Departments on climate disruption.

9	8	5/2/2017	Since the new administration has come in, we are required to get approval for every facebook post, tweet, as well as every response to every single reporter inquiry across the country. This process is burdensome and results in an agency that is NOT AT ALL responsive to the media. We rarely make deadlines, rarely are able to accept interview requests. The public is the loser in this scenario. The media plays an important role in getting information to the public about the GOOD WORK WE DO. It is time for the White House to trust the agency to do the GOOD WORK WE DO and have done for a long time. Regional public affairs offices have been handling media from the states in our regions with great skill for ages and the new process PREVENTS US FROM DOING OUR JOB EFFICIENTLY AND EFFECTIVELY.		Decentralize public affairs and let us do our jobs.			
10	9	5/2/2017	none	Strong support of EPA staff provides for more leverage in negotiating with the private sector. This does not mean always take punitive enforcement actions, but you can't successfully negotiate from a position of weakness.	Improve web pages to make more information easily available.		Improve web pages to make more information easily available.

11	10	5/2/2017	Having to still do paper copies of packages for review through the various layers of management. It would be much more efficient if things were forwarded electronically. Also things can "sit" with the IO for a very long time and it is often hard to determine whether things are even signed or not. We need better electronic tracking of things that are being reviewed.	We need to consider using the regions more efficiently. I work in the TSCA program and I honestly don't really know what the regions are doing to support our program. Because a lot of TSCA isn't delegated, what I would like them to do is to do enforcement even with program office FTEs. That would be the biggest bang for the buck. They should do multi-media inspections looking at TRI, RCRA and TSCA CDR at the same time.	I think we need to first ask them, as they are our customers, what they thing we should be doing a better job at. We used to have in the TSCA program regular meetings with states but those were discontinued. Perhaps we need to reopen those communication lines so that we learn more about what they need from us.	Yes. EPA has a tendency to start a "boutique" program and keep it going forever without evaluating whether it is still producing results. For example, the Compliance Assistance Centers in the Office of Compliance were established almost 20 years ago, are they working? Are they helping the states with their compliance assistance efforts? Are there parts of EPA that should be privatized, such as the Energy Star program. If industry does the LEED program, why can't they do Energy Star on their own? We need to get back to our statutory obligations, including enforcement of the law.	We have way too many separate databases within the various program offices. I am certain that HUGE efficiencies would be created and tons of funds saved if we joined together thru OEI's leadership on cloud support.	TSCA must by statute work more with OSHA. But we could still do more here. Similarly with CPSC. We need to look at how we can jointly address chemicals of concern.
12	11	5/2/2017	There are no process that prevent me from doing my job efficiently and highly effectively. Our whole office works together like a team.	Communication between our state partners is key. Many states do not have the experience or employees to get the job done without federal oversight.	Once again better, communication and outreach.	Our office just consolidated space to save money on our operating budget. We were able to lower costs internally without sacrificing experience or employees.	Our office has reliable technological tools.	A common complaint from the States is that they do not have enough workers or budget thus relaying on the experience of EPA employees.
13	12	5/2/2017	Reducing the number of timekeeping systems and forms would save a considerable amount of time. Also, forms and systems for travel purposes are redundant and inefficient. They could also be streamlined so that management would not have to approve the same item multiple times along the process.				Reducing the number of timekeeping systems and forms would save a considerable amount of time. Also, forms and systems for travel purposes are redundant and inefficient. They could also be streamlined so that management would not have to approve the same item multiple times along the process. Also, creating an electronic library (Wikipedia like?) for our processes, subject experts, and resources would save a lot of time.	

AMERICAN OVERSIGHT

	I
11	Personally, I think our Chemical Data Reporting (CDR) database is an excellent example of a program that is really working. Industry is happy with it and OPPT consistently asks the American Chemistry Council and others for feedback for improvements. How many programs regularly do that? We need to think about further consolidation with other similar reporting tools like the TRI program. Why should industries report to two different databases?
12	The employee review process lets EPA employees identify areas of weakness and then presents a plan to improve on those weakness.
13	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
14	13	5/2/2017				We are the EPA! Why don't we have more people teleworking from home regularly to help lower emissions and reduce office costs? Programs now allow for accountability measures to be taken to ensure employees are still achieving a productive job performance that is beneficial to the EPA and tax payer dollars. Not having to rent facilities from GSA or others to provide working space for employees could potentially save millions of dollars, lower emissions, paper waste, office supply waste, e-waste, save the roads, peoples time, quality of life, happier employees, etc. Huge cost savings to be had with telework.	Yes, employees working full time telework and doing business through virtual meeting places. Time for EPA to get with the times and save dollars and the environment too!	
15	14	5/2/2017	I think we should improve the Performance Appraisal Review process. In my opinion, it does not often reflect all the work an individual completes, or their entire portfolio of accomplishments. I think PARs should be based more on direct supervisor interaction with their staff, and supervisors need to be empowered to immediately provide feedback, positive or negative. They could be asked to maintain portfolios of performance. These portfolios could provide notes from meetings, products delivered, feedback from peers, etc.	Eliminate been counting exercises and focus on measuring environmental results. This might require more monitoring.	One thing we have to consider are the hours of operation. Regulated entities may operate around the clock, but we tend to only be available during normal business hours (e.g., 8am - 6pm EST). We need to be able to have support available on weekends, after hours, etc. This would also accommodate stakeholders located across all time zones.			Develop web services that are mutually beneficial for reporting/sharing information and data.

17	16	5/2/2017	Duplication of efforts when it comes to document management. I would address this issue by ensuring everyone is educated and actively using the computer systems we have in the agency.	Better Collaboration through the use of technology. Using Share Services available from other agencies, e.g., MAX Portal managed by OMB.	Continue to do what we have been put focus more on partnerships with customers.	Yes, Yes, Yes. We need to utilize technology better. We have an IT department that focus more on themselves than providing technology support to staff. We do have SharePoint, but we need folks in the region to be more astute about the capabilities of the system as well as have IT folk support the building of applications with the system. The application that would be developed would enhance our relationship with our stakeholders.	More plugins for SharePoint. Microsoft recently discontinued supporting InfoPath - a software program that allows us to create input forms to collect information from our customers with our in depth programming skills. InfoPath is still available but not supported as such by Mir	utilize shared services from other federal agencies, like GSA and OMB.
18	17	5/2/2017	Having the Comrade in Chief as President and Scott " What Climate Change" Pruitt as EPA Administrator. Get rid of them and then maybe we can do our job of protecting the environment instead of polluting it.	Keeping environmental laws and regulations instead of getting rid of them	Actually using science to make decisions instead of grade school talk.	Getting rid of the administrator would help		
19	18	5/2/2017						
20	19	5/2/2017						
21	20	5/2/2017						
22	21	5/2/2017						
23	22	5/2/2017	The entire contract structure within EPA is completely broken. It takes over two months to make adjustments to WA. Several of my contract mechanisms are over the performance period by 2-3 years. I find this completely unacceptable and an incredible waste of FTE and extramural funds. If you were able to streamline that structure, I believe that you could easily increase the level of effort by 20-30% of extramural funds. Another issue that I would like to bring up is the insane amount of middle management that has been in the past 10 years. One great example is the National program directors in ORD. Why is there a need for two complete set of management structures? It was supposed to help serve the program offices better, but it has only resulted in putting money into the NPDs pet projects. Please do a robust evaluation of any programs like the NPDs. It will be an immediate addition by subtraction.	I think you should explore more in the CRADA area and offer limited NAA in order to push measurement and control technologies. We need to research these areas but credible evidence makes it very hard. Also, please do not assume that private sector, s/t/l can fix the problems alone. While the cost of regs look high, the market is relatively small and cannot support the necessary research and development for implementation. Even in the large markets (telecom, computer, car, energy, etc), the US govt supports a LARGE amount of the research through DOD, NSF, etc.	Better customer service would be a great thing, but we are really stretched so thin that I think those stakeholders are the ones that generally take the brunt.	I would take a serious look at the wasted FTEs (commonly inflated grades) at the IO levels of most divisions and office level. Most of these people are failed management that are maintained there as they have no skills of use to the agency. Reduction of middle management.	There are always new technologies and processes out there, but rarely does one size fit all work and we are not nimble enough to quickly adopt the new tech/processes. Please consider the time loss and the expertise available on any changes before making those changes.	It practice we should do this a lot more on the federal level. It reality there is rarely shared responsibility and mutual interest between the agencies as they have different goals and statutory limitations. I commonly work on interagency projects in which the two depts/agency are working to different end, thus wasting amazing amounts of federal monies.

24	23	5/2/2017	Region 1 is pretty efficient and non-bureaucratic about document approvals and organizational processes. The primary barrier to more effective/efficient work is a lack of case developers, inspectors, and lawyers. With too many priorities to handle, it is hard to them to move matters efficiently, and matters can get bottle-necked when only one or two people are experts in a subject matter. Additionally, I am quite worried about the adequacy of succession planning.	Regular meetings have worked well. We have a good relationship with the trade association in my primary area, which provides helpful communication between regulators and regulated parties.	More personnel to handle the work. For example, when one person is handling too many matters, it is really hard to drop everything and be responsive to the time demands of a redevelopment deal that could ultimately provide the resources to clean up a site.	I think that one of the work week options should be a 35 hour week (7 hours per day, 5 days per week). Right now there is a big gulf between working full time (40 hours) and the 32 hour part-time option. I think many parents, retirees, and others would be interested in a 35-hour part-time option, and it would save the government money. People would probably get the same (or close to the same) amount done as they would in 40 hours.	There is a certain amount of time wasted in the review and editing of people's work. Some people just can't write well. Any technology that could help non-writers write better would be appreciated.	States should be convinced to take over the TSCA RRP program (although most don't want to). The regulated entities are just too small for our big federal penalties. For our chemical safety work, we should go over inspection targets with OSHA. We do a lot of coordination with OSHA, which has helped reduce inefficiencies. BUT neither agency should give up their focus on chemical safety. We have different focuses, penalties, and time frames for completing the work.
25	24	5/2/2017						
26	25	5/2/2017	I have no complaints.	I think the EPA is doing fantastic work as is.	In our office I think we do a fantastic job of meeting the public's needs as far as customer service is concerned.	Give us back some of the people we have lost so we can all do better work and not have to rush through everything.	I have no idea.	I have no idea.
27	26	5/2/2017	The People Plus system is hard to use/understand and I often make mistake that need later fixing.	I do not have any.	More efficient communication between divisions working on the same project will improve efficiency.	More standard operating procedures that are easy to understand by staff and prevent waste of time because we do not know the next step, or who to contact for something. And staff should be held accountable for adhering to the SOPs.	I do not know	Not sure, because my area does not share much responsibility with other US agencies. We already collaborate with international agencies that do same job, sometimes even share the workload; for example with Canada.

	A	B	C	D	E	F	G	H
28	27	5/2/2017	update IGMS grants management system. Its outdated and slow.	More regular face to face contact. This helps build partnerships and allows EPA staff to offer technical assistance to states tribes and territories.	Help them more, go see them, when they are stuck on an issue due to resources, lack of expertise or time be able to get on the ground to assist them.	If we had more resources we would be better able to serve our public and keep Americans safe. The budget cuts we have already faced have crippled some of the work we could do.	The grants management system needs to be updated.	We need to learn who is doing what at other federal agencies and have workgroups so we aren't duplicating efforts, and we can pool resources to help the public on various issues that multiple agencies are addressing. For example the Pollinator Protection is a cross-cutting issue for multiple agencies, and if we were able to work together at the regional level we could make a larger impact. .
29	28	5/2/2017	The multiple layers of management review/scrutiny of agency decisions in the Superfund program (in particular the emergency response and removal program) is a major hindrance to getting cleanups underway and completed. As an example, it is not at all unusual for there to be 2 or 3 (and sometimes 4) "pre-briefings" with varying levels of lower-middle management spread over weeks before the people most involved in the issue/situation are allowed to bring the matter to the actual decision maker (typically the Division Director). There is little to no value added by all these pre-briefings that also require briefing papers, slide shows, and power point presentations. There are simply too many levels of management that are "required" to review/approve (nit-pick) through the matters-at-hand just to get them to the decision maker.... it's the ultimate in "paralysis by analysis"					

AMERICAN OVERSIGHT

	I
28	We need to keep morale up. It takes a certain type of person to want to invest their life to public service, and we should foster that type of will, and keep it up. As an EPA staffer i get to work with some of the smartest and most dedicated individuals in our country. We care about the public, and should have our leadership promote the great work that we do every single day to make life possible for the American public. Not to let politicians demonize the basic human needs we address every single day.
29	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
30	29	5/2/2017	There is no reason for us to have to maintain two timekeeping systems in both PeoplePlus and LotusNotes; complete waste of time. I am a lawyer and I spent significant portions of my time performing administrative tasks, like putting together binders, mailers, formatting, etc., because we have very little administrative support. We need funds to hire competent administrative staff.	It is essential to maintain the regional offices. We can't partner with states and local communities if we don't actually meet with them. More operations offices would be helpful. Also, stop this rhetoric of Pruitt coming in and rescuing the states from EPA's grasps. EPA has been partnering with states for decades; maybe the Administration could learn about those partnerships by actually talking to EPA employees. Finally, our focus must remain on SCIENCE and PROTECTING HUMAN HEALTH AND THE ENVIRONMENT. This is the EPA.	Increased budget to talk to the regulated community about how they can comply with their permits. We need resources in order to provide customer service.	FOIA requires a tremendous amount of staff resources. We need a centralized FOIA office so the rest of us can focus on our primary responsibilities.		
31	30	5/2/2017						
32	31	5/2/2017						
33	32	5/2/2017	Employee forms for admin tasks (schedule changes, teleworking, etc.) must still be printed, signed by multiple people, scanned, and provided to the office timekeeper. It would be more efficient to have automated forms embedded within our timesheet software, since our managers have to review our hours in that software anyway.	My office works hard to partner with states and other stakeholders, but we need more staff and more funding in order to be effective. The best way to partner with public and private sector stakeholders is to attend meetings in person, hold webinars, create useful marketing materials, and travel to regions where there is increasing interest in partnering with EPA. We could achieve better results if we had more communications and stakeholder engagement staff and if we afforded them the ability to travel to stakeholder meetings when appropriate.	We need to be able to communicate with the public articulately, and to provide information that is relatable to everyone's daily lives.	Yes. We could reduce costs and inefficiencies over time by updating our databases and IT systems, and by providing our staff with continuous, relevant training opportunities (as opposed to borrowing training from other agencies that isn't very relevant). However, we don't seem to have the funding to do this.	We need updated IT systems.	We already engage with other federal agencies and states on a regular basis.
34	33	5/2/2017						
35	34	5/2/2017						
36	35	5/2/2017	We need a NARA-approved electronic document management system. Once implemented, it would simplify and make more effective many processes.	Public sector: Continue grants that are needed for all infrastructure improvements. Incentivize private sector to address pollution and waste problems.		More money and autonomy in the Regions, with HQ giving guidance for broad overall strategy but not needing to review / be involved in so many specific processes and decisions.	See response to #1. A user-friendly, integrated NARA-approved electronic document management system. To be efficient and effective, it would need to be something that can be searched by individuals and can feed into systems like FOIA etc.	More money and autonomy, staff in the Regions instead of so much control and staff at HQ would allow the Regions to better communicate with and partner with corresponding state agencies.

37	36	5/2/2017	Arbitrary limits on the number of accomplishments that we can do in a given fiscal year and how it appears to be a significant problem if we exceed our targets by even a small amount. I would recommend far more flexibility in setting GPRA targets and allowing us to exceed them without having to justify increased productivity or having that increase cause problems.	Increased funding for cooperative agreements and community grants.	Increased funding and staff levels. Not being able to effectively respond to major incidents or problems (like Flint, MI or East Chicago), without having to make significant sacrifices in other areas of EPA's programs, is a very big problem. Certain programs, like the Removal Program in Superfund, are constantly strapped for funding, which makes it extremely difficult to do the necessary work, especially emergency clean-ups. Regular budget cuts makes it all the more difficult to provide good customer service, especially for the public.		Continuing to increase adoption of electronic deliverables and communication.	Increased funding. Along with that, allow EPA more flexibility in working together with other federal agencies, such as perhaps allowing EPA to take a lead role (or co-lead role) in the assessment of federal facilities.
38	37	5/2/2017	Enforcement cases with consent decrees need not be routed through the White House for approval.	Encourage renewable able energy projects, waste minimization and reducing water/electricity use of private sector by being more innovative, competitive and forward thinking.	Provide BMP for industry sectors via their trade associations,e.g., waste minimization of generators, substitutions of toxic chemicals with green ones, reducing water use	Streamline permitting with on-line help	Citizen should be able to correct our environmental data on Envirofacts via a two-way communication, correct acuuracy or timeliness, location of facilities.	NOAA on ocean health and BIG waste maelstrom in Pacific, NPS and noise/air pollution/ozone in non-attainment areas, lead in housing with HUD, California and LCFS and better mileage requirements for cars
39	38	5/2/2017	The timing between receiving funds from accounting and the self imposed procurement deadlines is consistently off. We run into funds expiring before we can get them obligated onto contracts. Seems like the folks at these offices need to get together and rectify this. It wastes quite a bit of time and risks funds getting swept that could be used for good work by contractors.				We should be purchasing the best versions of software. The versions we receive often lack the few features that make them worthwhile. Examples include Outlook, which is not reliably searchable for replying to FOIAs and SharePoint which is rather clunky to use.	

AMERICAN OVERSIGHT

40	39	5/2/2017	The various databases for travel arrangements, such as "CONCUR", are very non-intuitive. A better system would significantly reduce the administrative work involved in making travel plans, authorizations, and vouchers - if it was truly better. If, however, it is only marginally better it would not be worth doing because those who travel more often have likely learned their way through the system and learning a new system will have its own downsides, even if it is marginally better. Similarly, the FPPS system is very nonintuitive - although again by now those who already have used it have learned work arounds to remember what to do.		Many State rely extensively on EPA toxicity assessments, such as the IRIS assessments, and multiple other EPA guidance documents on best management practices and risk assessment practices. Continuing to provide those would allow us to continue to provide good customer service.			
41	40	5/2/2017	Having to triple report to Washington on all media inquiries and wait for proposed responses to be approved by Washington, in writing, is terribly wasteful. The messages are not getting out. Reporter deadlines are not being met. One or two people in the Office of Public Affairs managing the approval of all media responses, press releases and social media for the entire agency is bad business practice and inefficient.	We need to understand what is meant by "respecting state's rights". What does that mean? What is a great model of success? What does great look like? No one at HQ has been able to clearly articulate to the regions what the management objectives are and what great looks like. Does giving more power to states mean agreeing with them on everything. Does it mean agreeing with California or New York governors on all positions, or some?	Get political appointees in place and get them familiar with the great work that their staff can do to achieve the president's agenda. The current skeletal staff of appointees aren't communicating with career EPA professionals. Priorities haven't been set. Goals and objectives haven't been laid out. How can we provide better customer service if our agency (career staffers and political appointees) don't, can't or won't work together.	Using Lean principles is a great way to reduce costs and inefficiencies. EPA embraced Lean in the previous administration, as has private industry and corporations world wide. Continuous improvement - invest in the people that can lead the Lean teams.		We need a fully staffed and functioning EPA team of political appointees (Asst. Administrators, Deputies, Regional Administrators, etc.) and staff to work as a team. Until that's put in place, we can't accomplish more, we can't accomplish anything!
42	41	5/2/2017	Stop requiring us to use ethanol blended gasoline (E10) in government vehicles. It has been proven that it is not better for the environment, it reduces fuel efficiency, and it requires us to waste time and money driving extended distances to find appropriate gas stations. What a waste!			During work related travel, allow employees to book housing through www.Airbnb.com in order to save money. It can be considerably cheaper than conference hotels.		
43	42	5/2/2017	Your current time and attendance system is very resource intensive the agency needs to look into going to shared services for time and attendance services. Such as the interior business	Involve states and decision-making decision	Solicit input from states and tribes	Doing more shared services with other agencies	Time and attendance	

AMERICAN OVERSIGHT

44	43	5/2/2017	- Complex, burdensome, confusing and redundant timekeeping systems - Not being permitted to use tools that would enable us to be more efficient/streamlined (i.e. using Concur to it's fullest extent; using the TripIt app/site; several different phone apps	- Our state, tribal, local, private and federal partners need more money to get what we need from them. Without the funding, the work falls onto EPA, and we're being slashed.	- communicate, communicate, communicate. - Focus on positive stories about how we're making a visible, positive difference, where staff are actively protecting human health and the environment - Be proactive with press releases and media stories - tow	Yes! Put all of our processes (contracts, travel, payroll, HR, permits, etc) through a lean process review! There's SO much waste, redundancies , rework, and systems/tools that don't meet the needs of our work.	- Move to Macs. - Increase internet/network speeds for the Regions...it's SO slow!!	
45	44	5/2/2017	Stop the newly-instituted OP over-review and scrutiny of simple FR notices and let program offices do their jobs.	Grant programs need funding in order to create meaningful partnership opportunities with public entities. Do not cut funding for lead prevention or enforcement. Be realistic about state ability to pick up enforcement duties -- most are not properly equipped. Take lead out of water, wheel weights, aviation gas, soil, and dust. Keep the RRP rule and move on the soil and dust standards. Finish the lead and copper rule. Do not soften lead or ozone or any of the naaqs. Do not kill popular voluntary and low cost programs such as Energy Star.	Listen to them. The docket for OA 2017 0190 is clearly telling EPA to continue its work, to protect air and water quality. The public may not know how to identify specific regulations to modify, but they do not want EPA to relax rules that are in place. The public likes the Clean Power Plan and clearly supports EPA's mission to protect human health and the environment. It is not EPA's job to create jobs, though our rules often do just that. Keep all regional offices open.	Commit to environmental health literacy for all. Support environmental education programs -- they pay off in many ways. Consolidate space in DC offices.		Support interagency task force work and do not shirk responsibility for problems off onto other agencies. Communities do not experience issues in a vacuum and they do not make much distinction between federal agencies.
46	45	5/2/2017	Anything surrounding federal register notices, Redundancies within processes, for example having to make 6 paper copies of a federal register notice when we are also turning in a digital copy. I would solve that by overhauling the entire federal register process. Another issue is when dealing with FACAs especially if you have new members the process is way too long and burdensome. I would have a LEAN event on that process alone and analyze what steps can be eliminated and implement the changes.	To achieve better environmental results with partnering states, tribes, private sector, and local communities, I think we need to rebuild trust with each of those stakeholders. States view us as their enemies instead of their partners and we both need to work together to achieve results. We also need to use our role as a convener to bring other stakeholder groups together so we can definitely reach the nexus of environmental results and positive economic impacts.	I think one way to provide better customer service is to provide more staff at headquarters the opportunity to work more with states, local communities, the regulated community, an the public at large. Too often HQ staff are viewed as the rule makers that don't know what happens when the rubber meets the road and we need to change that so we can better serve our stakeholder's needs.	One of the biggest untapped opportunities is to allow for maximum use of telework. Most offices don't grant employees the full use of the teleworking agreements mandated by OPM. By doing this, we could decrease the amount of office space needed through the introduction of hoteling. Also, our technology has improved over the past couple of years but it seems they always pick the cheapest contract which in return provides poor results so what seemed like a cost savings initially really ends up costing more money due to the inexperience and inefficiency of our IT contractor EZ Tech.	We could definitely make some existing software like SharePoint so much better if we had the full working version of it. Also, we need more access to programming and even journal articles. Also getting training should not be as difficult as it is, for example EPA will not pay for certifications which is unfair particularly for those of us that are project managers and would like to have a Project Management Professional Certification which would make us more efficient in program management and other areas. Where there is a need and a willing staff member ready to become and expert, that should be encouraged.	We could accomplish more by allowing the federal family to break out of the stovepipes. For instance, sharing funding between agencies should not be as hard as it is now. Also there are agencies where we have overlapping duties and we need to work with them better.

AMERICAN OVERSIGHT

49	48	5/2/2017	There are too many people recreating the wheel without working with other Regions to use one method of data storage and analysis for a variety of media and uses. Using too many different programs leads to redundancy and waste across the EPA and within the grants department who are usually awarded money to manage various databases or create new ones. In order to do our jobs more effectively and efficiently, we need to streamline our data warehouses and keep them consistent across Regions. We need to examine why we use the databases we're using and who is the end user of the data. Some data warehouses serve little function to an end user and some are obsolete, but everyone is afraid to let go or transfer records because the purpose of that database is now unknown or not understood. There are way too many databases to list here but there are a multitude of databases in every office in every Region that could be consolidated and/or transferred to more efficient databases that are used in	We need to realize that achieving better results costs money. You can't cut EPA and then expect better results to occur. Our funding is already low. Protecting the environment doesn't make money for businesses. You can't trade it on Wall Street. Protecting the environment has to be a priority of the federal government in order to protect the air we breathe, the water we drink, and the land we live off of. There has to be more funding available to states, tribes, and local communities in order to pay people and processes and activities that will help protect our environment at the local level. Upper level management also likes to impose action items on the states to prioritize their work for them. This is a hinderance to the specific needs of each state, tribe and local community. Let them decide when the priorities	I think we should be working more closely with non-profit organizations and coordinating with them to help magnify the impact we have at the state and local levels. HQ deals with grandiose large organizations, but the smaller groups that are on the ground getting work done need to be coordinated with as well. Regional representatives work the best to communicate and work efficiently and effectively with states, tribes, and local communities. We get more face to face contact, we know and understand the area and states' individual needs. We know the culture(s). We know the people. We go to bat for our states and communities and we care about them. They know we care about them and want to help them and I think that is the most important aspect of customer service and buoys our states and communities up to accomplish difficult tasks.	Having a centralized HR system has been the WORST idea ever implemented at EPA. It is atrociously inefficient and ineffective. The HR reps going through resumes and applications have no understanding of what they are reading or looking at. The system they use to weed out applicants is horrid and ends up delivering a limited pool of applicants that aren't necessarily fit for the job because they are bogged down too much in education course titles or degree titles that they don't understand. We need regional HR representation so that staff and managers can help HR pull together a pool of applicants to interview that we'd actually want to hire. Really invest in a good

51	50	5/2/2017	Time cards at EPA make no sense. When I worked in the private sector, what you entered into your timecard was not important as long as you delivered on the tasks assigned to you. At EPA timecards are considered to be as important as actually doing the work you are assigned. Currently, I am required to account for my official time in three different places: An excel spreadsheet, PeoplePlus (An Oracle software product), and Webforms. I have to manually copy my time from People Plus into an Excel spreadsheet and then email this to three people for review, my first line supervisor and two administrative assistants. The administrative assistants make sure that the excel spreadsheet and People Plus time cards match up. Multiple people are comparing two spreadsheets with several lines to make sure they match.This is onerous and a recipe for human error. Furthermore it serves no purpose to protect against fraud, which is the alleged reason why					
52	51	5/2/2017	Lack of leadership: My office has been playing musical chairs with managers. I had no manager for two months, when mine went on detail. Right now, I report to an acting branch chief, who reports to an acting division directory (we have no deputy division director). Because we've had so much turnover, no one has the knowledge or willingness to make the decisions that Transfers have to be approved by our Acting AA -- this is ridiculous and a waste of time.	Communication.	Develop more decision support tools that our stakeholders can access, so we can support and educate them, but also make our processes more transparent.	Move forward with more high throughput toxicological screening and incorporation of that data into regulatory decision making. Develop more predictive models for exposure and toxicity, and allow us to use those as well. Apply a Lean approach: identify processes that can be automated (such as site specific risk assessments in Superfund, or literature reviews in IRIS) and work on implementing those approaches, to allow staff to focus on other tasks. We have staff who oversee contractors who basically do the jobs of the staff. Why not have staffers do their jobs themselves, and eliminate the contracts? For example, someone I work	Lean six sigma -- more process mapping and process improvement! There's an enormous amount of resistance to Lean in the government, but it does work. Maybe form a special lean team that can consult -- with people who actually know what their doing. Look at rapid application development to automate simple tasks and empower staffers to do more work better.	EPA offices often have duplicative functions -- figure out what those are, and have the same staff handle those tasks for both offices. It creates better cohesion between offices and reduces costs. Skills marketplace is a great way to have people fill those types of roles.

AMERICAN OVERSIGHT

	I
51	
52	High throughput chemical screening, predictive toxicology/cheminformatics, and high throughput exposure assessments. Use low cost and fast approaches to prioritize animal testing or expensive systematic reviews, and work on strengthening those approaches to ultimately eliminate old school approaches. EPA has some of the world's leading experts, in ORD -- NCCT and NERL, and when I worked in the private sector, we collaborated closely with them. Work on having more of the program offices understand and utilize their tools and technology.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
53	52	5/2/2017		Well-defined and publicly-shared data systems! These would help reduce duplication, and would allow EPA, states, the regulated industry and the public to work from the same set of "books."		Although establishing robust, public data systems would require an initial expenditure, the end result would vastly improve efficiency. Across the agency and the nation, we have hundreds of data systems for tracking one thing (air or water quality, for example) that do not "play well" together. This leads to a lot of duplicative effort, and a lot of confusion across the board. Public systems would also enable EPA to focus its work nationally on the most significant problems.	Yes! An IRS-style system for compliance inspections that combines targeted inspections (focused on facilities with known issues) with a separate system of random inspections (for gauging overall compliance).	Again to the data systems. States are struggling to maintain experienced environmental data staff. States and EPA have been at odds for years over data because states would like to establish and maintain their own data systems. This is completely understandable. But, if we could review and identify the best state systems, and then support states to adapt to these, it would benefit both states and EPA in the long-run.
54	53	5/2/2017						
55	54	5/2/2017						
56	55	5/2/2017		Several programs require EPA approved/accepted strategic planning documents before EPA grant dollars can be spent to meet state/tribal/local community goals. In the eyes of the community, the plan serves only the purpose of being eligible for EPA grant dollars; it's seen as overkill and often duplicative of other local planning efforts. By reducing these administrative planning burdens, states, tribes, and local communities could better focus limited resources on achieving environmental results.				Organize into interdisciplinary teams (a la "Team of Teams" by General Stanley McChrystal). Often times, the focus on ecological science often fails to recognize the value of economics, agronomy, and other science fields. Generally, employees with these backgrounds are isolated and grouped together rather than being interspersed with scientists and policy writers. As a result, ideas are often discarded before they're fully considered because they're not phrased in ecological terminology.

57	56	5/2/2017	Telework policies are archaic and make no sense. Employees should not be limited to working at a single designated Alternate Work Location. Eligibility for telework should be made on a case-by-case basis based on whether work is portable and performance history of the employee. The "business case" for telework should take into account cost savings from reduced lease space and other accomodations. Employees should either get a stipend for home office equipment or should be able to write off home office expenses.	Provide adequate grant funding for state Cooperative Agreements.	Increased funding for grantees is key. States, tribes, and communities have seen declines in funding every year since I've been employed, despite rising costs to do business.	Improve data systems across the board. One area that needs attention is time and reporting. There are huge inefficiencies in tracking our time across multiple systems. We currently have credit hours work sheets, PeoplePlus time reporting, PeoplePlus absense requests (not connected to time reporting), a Lotus Notes in/out calendar system, Webforms for reporting episodic flexiplace, a separate time sheet for tracking Guam related activities, and individual communication with my supervisor and team on a day-to-day basis regarding everyone's individual statuses in the office.	Our individual computer systems are horrific in their inadequacy. There is not enough memory in my (practically new) computer to run needed programs. Databases we use need upgrades; they run incredibly slowly even when connected to a wire. The Agency's main grants database runs on an antiquated Lotus Notes Database that barely functions. Investments in IT infrastructure are critical. On the same note, we need better options for transferring files to other agencies, contractors, and the public.	Agencies should align on the response to lead poisoning prevention and lead remediation.
58	57	5/2/2017	There are very few administrative requirements or management procedures that prevent me from doing my job (I'm a staff level engineer doing direct program work). My EPA regional office is very lean, managerially. In fact, our organizational processes are so slim that we are verging on being unable to function organizationally.	100% of my job is working with states (I work in the TMDL program, which is a "cooperative federalism" program), and I work regularly with Tribes and local communities and the private sector as well.	Because my job involves direct and regular interaction with states, tribes, local communities, the only thing that could help me do that better would be to have more time and resources. In general, I take a lunch break once per week, or less often, so that I can continue to maintain my relationships with external partners.	Actually no, I don't see any easy ways to maintain environmental protection. My state counterparts and some of the industries I work with (e.g. paper recycling facility) are requesting MORE EPA staff involvement (not less).	EPA's adoption of Microsoft products that support remote participation in meetings has been great, and has saved EPA a lot of money. Please continue supporting that kind of technology.	We are already aligning our interests with States (in the water program). Aligning our activities with federal agencies is more difficult because our missions are often very different; and we don't' have the staff or management time to establish the agreements / procedures that allow that kind of realignment.

AMERICAN OVERSIGHT

	I
57	Our Environmental Justice program (slated for elimination in the presbud) has succeeded, despite few resources,to build awareness of the differential burdens of pollution that impact minority and low-income communities.
58	It would be useful to provide project management training to staff in the Water, Air and Haz Waste programs; and to set up a workplan tracking system that allows staff and managers to easily prioritize and track the work that staff are doing.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
59	58	5/2/2017	Headquarters "oversight" of regional office activities is often disproportionate to the value added and thus, at times, just slows down the process. This can cause delays in the pace to which we can respond to states, tribes and members of the community. I recommend the HQ offices all review the actions they take to review work completed by the regions and, in association with regional staff/management determine areas where oversite is no longer needed.	Each entity has a unique and important role in attaining environmental results. It is important to recognize which entity is best suited to address each aspect of a program and allow activities to occur at that level. The closer proximity to those we partner with, the more efficient it typically is. Thus, when evaluating cuts, look first to cut the excess in the DC offices who have little to no daily contact with our partners and leave the positions in the regions funded.	In my regional office I think there is good customer service and work with our partners and regulated community. Further investment in our web space would be beneficial -- but it has to be done in a user friendly way for both EPA and the user. Our current system is not EPA friendly and there are many roadblocks to getting information posted.		Please do not introduce new technology/programs etc without fully vetting them and making sure they will work for all of EPA. LOTS of time is wasted when new "tools" are launched and we are required to learn how to use them, esp. when it seems like you have to have a book of special tips to navigate them.	We can only go as far as our individual authorities and budgets allow. When we/they don't have the budget to invest, that should be openly discussed and appropriate decisions made as to how the work will move forward with more limited input. When we have shared responsibility but somewhat differing roles or statutes, that has to be acknowledged and a path forward charted that aligns with those limitations. We won't always lie on the same side but need to work towards moving projects forward.
60	59	5/2/2017	How about an Administrator who is admittedly in hock to the Koch Brothers and the rest of the fossil fuel industry, and to avoid legitimate charges of conflicts of interest, should at least recuse himself from any more decisions connected with the 14 times he sued EPA as AG of a Petrochemical state (I think he as already granted the fossil fuel industry victories with his decision to withdraw information requirements on methane leaks from the O&G sector, and to stay the Waters of the US rule).	Fully fund State Revolving Funds to provide assistance to the States. Pushing more responsibilities onto the states while cutting EPA funding is likely to be self-defeating in protecting public health and the environment.	Respect Tribal treaty rights by supporting rights to fish, hunt, collect food and medicines at their "usual and accustomed" places of doing so. Respect responsible members of the regulated community by diligently enforcing laws against "bad apples" that have little concern for public health and ecosystem protection. Respect states and the general public by telling the Truth, speaking Truth to Corporate Power and Fox Fake News. Telling the truth is likely to increase public credibility in the Agency's actions. Recognize that EPA's "customers" should be the U.S. public, not large corporate donors who wish to destroy democracy. To paraphrase Justice Brandeis, we can have democracy, or we can have a small portion of the population with concentrated wealth; we cannot have both.	Organophosphate pesticides are left over from nerve gases developed by the Nazis. They may do a great job of killing insects, but they have side effects for workers, children and neighbors of farm families, and to adults and children through consumption of food and contaminated water; and to important non-target species. In the current regulation cutting fever in DC, each food use of a pesticide is a separate regulation. The Administration could protect public health and ecosystems by revoking all remaining tolerances for organophosphates, and cancelling their registrations.	Biological-based control for pests is already being practiced by agricultural growers. Cancelling old, dangerous pesticides will encourage the development of safer, more nature-friendly pest control measures. The atomic power industry is dying of its own economic weight. Stop supporting measures that further coddle an industry that has been subsidized to the teeth since the Manhattan project. Coal similarly is economically unsustainable, and exists only through continued subsidies and socialization of its human and environmental costs. On the other hand, renewable energy technologies already employ more peopled than the coal industry. A carbon tax will help the nation move to the	Advocate for eliminating federal subsidies for corporate polluters, such as the coal industry, the oil and natural gas industry, the atomic power industry. The economic unsustainability of atomic power, for example, is demonstrated by the bankruptcy of Westinghouse, which incurred cost overruns even on a power plant that was built only with foolish federal loan guarantees.

AMERICAN OVERSIGHT

59	Pilot test the idea on a small group first and then be open to the possibility that it might be a good idea but not right for here.
60	Well, Mr. Kusher said govt should be operated more like a business. As a public health Agency, we can increase our fund by fining corporate misfeasance, malfeasance, and nonfeasance more effectively, and protect human health and ecosystems at the same time. The nation should also not be running a deficit, nor allowing profits to be privatized but costs to be socialized. Support real reform of the tax system, with those who have had the party for decades being expected to pay their fair share for the party, and not subsidized.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
61	60	5/2/2017	There is not enough money from congress for EPA to invest into adequate and up to date IT, database, and other technical systems. Because our budget is spread so thinly, we cannot afford to invest in improving IT infrastructure. Our HR departments, contracts departments, and OEI are all spread so thin because there is not enough money, and therefore are not able to provide adequate support to the staff and programs.	EPA needs more money from congress to invest money into staff, legacy transitioning, and contracts. Staff and contract dollars are spread so thin that they cannot be focused on outcomes. We are planning from continuing resolution to continuing resolution, not allowing us to properly plan for the future. We have to be conservative with our current dollars for fear that they will be cut so heavily that we will have to stop work. This leads to poor morale internally, and also puts strain on the private sector contractors that we are paying through these contracts. the states/tribes/local communities cannot get the attention and focus they need when staff are spread so thin that only one person knows any expertise in a subject area. EPA needs to be able to hire new people regularly in order to maintain knowledge of	EPA needs more money from congress to invest money into staff, legacy transitioning, and contracts. If we had more staff to do the work of one person, rather than of 5 people that retired before them, it would be much better for EPA to be customer service advocates for the public.	The only way to increase efficiency at EPA is to increase the budget and allow room for innovative ideas. There is no time or money to focus on innovation because staff are spread too thin. EPA staff are focused on the work and committed to the mission, more than any other agency. The only thing we can do to increase efficiency is to alleviate pressure by hiring more staff, allowing for legacy transition, and introducing innovative practices into environmental protection.	Hiring processes need to happen quicker and more often. There are many, many people at EPA eligible for retirement who have worked here for their whole career. These staff need to be recognized for the amazing work they have done and the unique and invaluable knowledge they hold. We need to focus on transitioning that knowledge to the next generation, without creating a giant burden on the next generation of having to take on 3 people's jobs at once when they retire and the budget doesn't allow for hiring. Start with hiring HR staff because they are spread very thin.	The states do not want to raise their taxes to accommodate for cuts in funding from EPA. If we cut funding from state programs, the communities will suffer. there is plenty of room in the federal budget for EPA to increase its budget without taking away from other agencies. EPA is constantly audited, and is always trying to do what is best and most efficient, more than any other agency out there. Areas of "shared responsibility" are a myth that does not play out in actual practice at EPA. EPA does what is within its authority to protect human health and the environment for the public.
62	61	5/2/2017	I spend hours daily opening the mail. We are the EPA. Can companies not send things electronically? There is no reason that someone should overnight a box of bound documents only for an admin to have to open that box, code it, and then send it to the file room and it never is seen by a staff member. It's a waste of the company's money and it's a waste of EPA's money to store such documents not to mention the mountain of trees that are used daily for these reports.	Require electronic reporting. Give the folks that go out in the field a means of electronically gathering information (tablet, camera, etc.) and paper will not be needed.		There are many untapped opportunities dealing with replacing paper with electronic formats, not just regarding the mail.	Instead of making copies of documents while on inspection, why can't the inspectors bring small, portable scanners?	I understand that Concur Travel or BCD should be paid for times when they are questioned however, I do not agree that they should be paid each time we schedule a trip. That seems a little unnecessary and a way that we are spending too much.

AMERICAN OVERSIGHT

	I
61	There is no where left to reduce costs at EPA. The only way to increase efficiency is to spread the work across generations of employees to allow for smooth transitions over time. These are SUSTAINABLE business practices.

	A	B	C	D	E	F	G	H
63	62	5/2/2017	The only thing preventing us from doing our job effectively are resource constraints and management policies and decisions that are inconsistent with established science.	Ensuring that agency policies and decisions are based in the law and science.	Being provided adequate resources to effectively engage with our partners and provide certainty and federal oversight.	Move away from the contractor model (i.e., outsourcing government work to private contractors), which has proven more costly and ineffective than simply providing the same resources directly to the agency in the form of staff dollars and FTE.	This impies that the agency is not already efficient, effective, and accountable. Over the last several years of budget restrictions and sequestration the agency has been struggling to cover our core work with less and less and less resources. I belive we are operating about as efficiently and effectively as possible given our resource limitations, and as someone who works day in and day our I take issue with any assertion to the contrary. As far as accountability, EPA has a robust culture of public engagement and involvement, and is constantly under the watch of congressional oversight committees.	We cannot. Contrary to the opinions of our current Administrator, nearly every state environmental agency is strapped for resources with minimal capacity to even accomplish their mandated duties as it is. They cannot be expected to take on additional responsibilities.
64	63	5/2/2017	While fraud and abuse should always be identified and eliminated, some of EPA polices spend thousands of dollars to prevent the loss of mere tens of dollars. For instance, I once made a small error in my mass transit subsidy, amounting to approximately $8. The person who caught it and sent me a menacing letter, as well as my time to make the correction were paid approximately $100 for our total time to correct the error. This could have been prevented by a) having that person just make the correction, since my time sheet revealed the error and b) creating a payroll data system that automatically accounted for transit subsidy (and absences, scheduling and flexiplace, etc.) that would be accountable and accurate and make fraud impossible.	Overall, working to better match regulations to implementation and data management. One major problem is that EPA HQ is largely in charge of writing regulations, while the Regions, States, Tribes and local communities are charged with implementation, and other branches of government or EPA are in charge of data management and tracking while yet other departments are in charge of enforcement. The disconnects in this process are hugely inefficient and problematic. Regulations should always be written with the implementation, data management and enforcement much more closely connected so that the final product, though it may take a bit longer to complete, would better facilitate the long-term costs of executing the regulations.	Actually our customer service is top-notch. What could be improved though would be to ease the burden for communicating via the internet, freeing up information sharing. Right now, putting up a web page is far too tightly controlled. Training staff members to empower them to make faster, dynamic and up to date web updates would go a long way.	The proportion of EPA HQ staff and management is far too high. More needs to be done in the Regions, as that is where the work is, not in D.C. With better information management online, software improvements (see below), the need for so many people in D.C. to write regulations and report to Congress could be trimmed considerably. More resources to Regions, Fewer resources in D.C.	Contracting for software is especially wasteful. Software needs are not "one-time" and are more inherently governmental than was once thought. Specialized software must be developed and re-developed constantly. Using very expensive fixed price contracts makes for huge budgets. The end product is the most expensive software on the planet, which performs the worst, usually obsolete once finally made available. EPA should invest in more "in house" software developers who can manage teams of level of effort software developers, who are contracted to just work 8 hours a day, under the direction of EPA software experts. All software source code should be owned by EPA. Contracting is OFTEN	Reporting requirements, inspection requirements, contracting regulations, construction standards, and certification requirements should all be aligned across federal agencies. For example, If the Public Health Service has an inspection requirement for public water systems, and EPA has an inspection requirement, the content, timing and manner of these inspections should be aligned exactly so that the federal resources will be most efficient and the regulated community would have the least burden to meet the requirements.

AMERICAN OVERSIGHT

	I
63	
64	Too much is done indirectly and through contracts that yields higher costs for poorer quality. We must pay contractors to be our "people in the field" at a much higher cost than if we had adequate travel budgets. Those contractors do not have the EPA mission at heart, nor are they necessarily the experts in the field. Offer this deal to each EPA program: We give back $100,000 in contracting dollars for every $20,000 additional travel budget given. EPA could save millions by this re-alignment of funding allocations, and we would DIRECTLY get better results with the regulated community.

AMERICAN OVERSIGHT

67	66	5/2/2017	Minimize multiple layers of document reviews and try to get responsible charge of issues to the lowest reasonable level allowed by law and relevant delegations of authority. Encourage peer level technical reviews.	Support with time and travel and training funding, joint training and even informal education between state and tribal counterparts. We should have the opportunity to better understand "their world" and vice versa.	For project management level personnel, like Superfund RPMs, keep the active Site load light to allow more timely attention to specific Sites.	Optimize the use of PAID overtime (not "comptime," for productive and efficient individuals). Having come from the private sector, I have a driven work ethic and would gladly put in 8-10 hours of paid OT to get more things accomplished in a week. I get plenty of paid vacation and holidays so compensatory time off isn't needed, plus that time off is obviously non-working time.	Software tools at EPA seem to have been driven from the top down (e.g., Office 365). Since joining the Agency in 2009, I never recall a survey asking what software tools would help me do my job...seems ridiculous. I'm a project manager who can't get a copy of Microsoft Project (PM planning/schedule software), even though we are so schedule-driven. Ugh.	This is a tough one. Given I am in Superfund under OLEM, I think EPA's role is quite unique. The NCP (40 CFR Part 300) gives RPMs and OSCs and EPA specific duties that lead to emergency and non-emergency actions at uncontrolled hazardous waste sites. Our training and expertise is robust compared to our state counterparts. Cross pollination as suggested in No. 2 would be helpful.
68	67	5/2/2017	Administratively, we need to make sign-off processes digitized, to improve the speed at which we can review documents. The same could be done for FOIAs. With respect to management procedures and organizational processes, we need to ensure that the procedures and processes in effect within programs are advancing environmental results. All too frequently, procedures and processes are made for the federal bureaucracy, as opposed to the law or the environmental benefits they seek. For example, management procedures for funding and organizational structures emphasize bureaucratic preferences, as opposed to the results that political appointees seek. Here, political appointees should have far more control on budgeting and oversight matters.	I would like to see EPA take the approach of HHS/CDC, and better dedicate staff to States, Tribes and local governments as they need. This could be done by placing staff within State/Tribal/local government offices to help them with issues surrounding environmental improvements or sustainability goals. CDC and USDA, among others, are better at siting and staffing federal employees in areas where they are most needed and most effectual, all while reducing travel dollars.	The best first step is a Senior Management Metric/Key Performance Indicator for such customer service. For far too long, EPA Senior Managers have not been held accountable in being responsive to State/tribal/local concerns. To this end, all Senior Managers with responsibilities to State Commissioners / Tribal Leaders should be evaluated by such stakeholders in some way, perhaps in a yearly survey or in the context of ECOS. More accountability must be had in this area.	Yes, particularly in better consolidating certain programs with similar missions (e.g., better consolidating Brownfields, RCRA Corrective Action and Superfund staff to coordinate and streamline actions; streamlining EPCRA, FIFRA, SPCC, RMP and TSCA reporting, etc.) As part of such consolidations, the layers of management should be reduced. For example, within my program, I have more managers than staff, and staff is overstretched.	Yes, we should be better harnessing big data, and how it can inform our decision making. As part of that effort, we also should be working with State/tribal/local governments, industry, NGOs and associations and citizens to make both reporting to EPA, and acquiring EPA data simpler and easier. Currently, many EPA reporting programs are separately designed and developed, without any attention to complementary programs or other data collection in place.	I would start with a chart of programs that are inherently federal versus those that are delegable. Then, I would poll the States/tribes on the delegable programs and gauge their interest in taking them on. For programs with high interest at the State level, we should be better working to delegate and better fund the States/tribes. For those that States/tribes do not want, or for which authorities are not delegable, we need to be sure that EPA is resourced to meet those missions and help States/tribes without such interest. For example, for certain non-delegable programs,

67	See responses to Qs 1 and 3. Optimize number of FTEs with providing paid OT for estimated actual work hours needed to perform a mission.
68	In increasing accountability, we desperately need to consider new mechanisms for improving employee performance, particularly for managers who are unaccountable to their Supervisors and their staff. Within my Region (Region 5), there are many managers actively bullying, harassing or otherwise discriminating against individuals, many times the highest performers. The same applies to staff actively not meeting their metrics from year-to-year. Consider GE's personnel approach (e.g., "the bottom 10% are out") in addressing these issues. With respect to reducing costs, we need to reduce the layers of management in overseeing operations, as

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
69	68	5/2/2017	I have thousands of permittees, many in rural Idaho. We need more money for database design and support. When we have well designed databases it helps ease both data entry by the permittees and data retrieval by state watershed managers. Knowing what is in the air and water is very important to our communities and reliable, accurate, publically accessible databases are a key part of that. EPA budgets have been cut and cut, leaving us unable to hire the programming talent needed to fix bugs and adjust the databases to make them as easy as possible to use.	We used to have staff available for compliance assistance, which was very popular with states, tribes, local communities, and the private sector. The funding for those positions has been slashed, leaving us with very few people to answer the telephone and process concerns, complaints, and questions. We no longer have travel money to go out to communities when they ask us to come and help them understand water permitting options. Re-funding these positions and providing travel money is critical to making sure that we understand the needs of states, tribes, local communities, and the private sector and are able to respond to those needs.	As in my answer to Q2, re-funding the compliance assistance positions and the now totally zeroed out travel budgets. When we had knowledgeable people available to answer the telephone and go out to community meetings we learned much more about how to adjust both our communications about existing regulations for clarity and about how to best support our state, tribal, and private sector partners in our shared goals for clean air, land, and water. I answer the telephone for 4 states, 30 tribal governments, and 2,356 permittees. I do my best, but our states and tribes are shedding employees and it is close to impossible to empty my inbox with the sheer volume of inquiries.	As in Q1, there is great potential for improving our public access to information and reducing the time spent on FOIAs if we could invest in computer programing talent to make our databases more user friendly and effective. In addition, there are excellent opportunities to tap into citizen scientists to expand our assessment and understanding of environmental metrics, but to take advantage of those opportunities requires up front investment. Trash tracking apps, game-ifying reporting, and other ways to make it psychologically rewarding for citizens to be active participants in environmental protection have great potential, but need support to get launched and maintained.	Ah, I anticipated this question in Q4. So many! For example, allowing federal purchasing to take into account life cycle costs rather than just initial cost, would improve taxpayer value for goods purchased. Buying 5 pairs of cheap boots is ultimately more expensive than a single, durable pair.	Travel funds are key. In person meetings are irreplaceable to create relationships of trust. We currently have no travel $, and that results in longer, less productive negotiations.
70	69	5/2/2017	We have too many time keeping systems that don't talk to each other: Maxi-Flex in Lotus Notes, PeoplePlus and the Travel Comp system. Vast amounts of time are spent correlating and x-referencing these systems that could better be spent on real work. I get fewer calls at my desk today. Possibly some numbers could be shared efficiently. On the other hand, the agency has yet to issue a cell phone to me. An office cell with a docking station and headphone might address some of this.	Frankly, we need more and better staffing in the Community Involvement portions of Superfund and the Congressional Liaisons in the RA offices. The CIC's should be formally available to all Divisions and trained to have broader knowledge of agency programs--not just Superfund. The Small Business Ombudsman roles could be upgraded too (what do they do?), and elevated to RA direct staff like the Congressional Liaisons. The various voluntary programs that impact the private sector could probably be consolidated with a senior manager assigned--and probably some could be eliminated.	Our customer service is probably better than we get credit for with some groups. Generally, we need better coordination and more veteran managers with broad knowledge of the agency in the mix so that these outreach/customer service efforts are not as stove-piped. Regional Team Leaders who coordinate all the activity in a state or metro area would add efficiency and expertise, and give stakeholders a senior person to take concerns to. FOIA needs more training, skill and investment. It's a function that never goes away and probably could be further consolidated. If we invest in higher skill staff, efficiencies and responsiveness will follow.	End the SEE program and either hire people at a decent wage or explore say, hiring recent college graduates on a 3-year contract in which they can develop some skills and later be hired by the Agency or elsewhere in the Government or Private Sector. The SEE program pays a terrible wage and is endlessly at risk of being cut. We don't invest much in it and we get what we pay for. There are very few administrative or paper shuffling jobs anymore.	Finish the tablet inspection report templates that HQ never seems to finish or have enough money for, and then give all of our inspectors tablets with inspection report macros on them. This would help immensely. Our Oil and Spill Response capacity needs to be better resourced--especially with the Administration's focus on fossil fuel development. More production and aging pipelines inevitably means there will be more spills to contain and cleanup. The States are not resourced to do this.	The States don't have the resources or political will to take on much work from EPA unless we pass considerable $$ to them to do this work. EPA's core statutes should be handled consistently from state to state; Air and Drinking Water standards, and cleanup standards should not be subject to local conditions--that's not fair to communities or businesses, especially if they operate in multiple locations. There may be some scientific chemical review work that EPA and OSHA could work closer on, or an effort could be made to streamline worker and public health standards.

AMERICAN OVERSIGHT

	I
69	Fully funding enforcement staff time and travel, particularly for remote tribal communities, is key to making our rural citizens feel secure. We receive many complaints from people who feel like we are ignoring their concerns because we cannot get out to respond in a timely way.
70	Hiring a few more people with current technology and industry sector skills, who will stay sharp and in touch with private industry, who can share with the Regions and Labs, would be helpful. Technology is constantly evolving.

71	70	5/2/2017	Some of the training classes here are ludicrous. Laugh-elocity (Did you know laugh in the workplace is good for you?), Body Language (I am very good at this and do not need to take a class), Retirement Training (Really?), Mental Health First Aid (Because of you and your boss), Navigating the Political Landscape (ditto). We have unit retreats that are a total waste of time. How would you like to run around a room for 8 hours with adults (I think) being red, yellow, or blue? Maybe on Sesame Street. New class starting about the uncertainty that you and your boss are putting the EPA through. All I can think of is Gloria Gaynor's "I will Survive."	That's a whole lot of work you are talking about. Get rid of endemic work allergies in the building. The big talkers, little doers.	If they have a problem like Flint, Michigan, caused by any of the above, then the EPA needs to be there and assess immediate citizen needs. We're all about the citizens, right? Not the harm doers.	We have an incredible amount of who we call the "walking dead." They wander the halls and the mall. They have: a) nothing to do, b) a lot of well-deserved time on their hands to socialize, c) no work in progress, d) retirement dreams, e) a free $1800 Eco Pass that they can roam the light rail system on, f) Starbucks on every corner, g) a new Union Station with umpteen places to hide.	I don't see very many expanding or fine tuning their technical skills. Not that it doesn't happen. But this organization appears to be sorely computer illiterate. Sad day for all those that call themselves scientists and engineers. Looks like you're good at the eating set of skills.	Good luck. Have fun. More hard work.
72	71	5/2/2017	I have the benefit of having worked in HQ for many years, as well as in a Region now. When I was at HQ, I found that there were too many middle managers (branch chiefs, division directors, associate division directors, associate office director, office director) between my position and the AA. In the Region where I am now, the offices/units are smaller of course, but there is only one manager between me and the Director. This collapsed management structure ensures there is less bureaucracy for me to go through to get concurrence/approval on my work. in sum, I think there are too many middle managers in programs at HQ and the bureaucracy is inefficient - this could be streamlined.	To achieve better environmental results, you have to know what environmental problem you are tackling first. I had the benefit of working on our new National Enforcement Initiatives (NEIs) and the problem I saw at the outset is that we were "targeting" specific entities. Instead, we should focus our efforts first on identifying the issue or problem and then deciding how to remedy that problem - maybe it is an enforcement action against private or public entities, maybe not. I encourage the new Administration to read Cynthia Giles' article, "Aiming Before We Shoot" from June 1997. This was instrumental in changing how I thought about environmental enforcement and achieving environmental results.	I now have the benefit of working in a Region. We have great customer service and the states really do look to us for help on interpreting regulations and drafting permits. This dialogue should be encouraged and leads to less confusion amongst the regulated community. Reducing the EPA workforce will negatively impact these types of interactions. If you reduce our workforce too much, the states will not get the answers they need and this communication will stop. Be prepared that citizen and non-profit groups will see an opportunity to file lawsuits if there are vague permit requirements, etc.	Yes - we drive a lot of our enforcement results based on "numbers" -- how many cases we resolve, pounds of pollutants reduced, etc. When a Region has to meet a certain case quota, this can lead to less enforcement discretion. In other words, if a manager thinks that they need to have "x" number of cases resolved by FY end, then attorneys and compliance managers may feel the need to prosecute every case/violation, regardless of severity. Instead, we should be focusing our resources on the cases/issues that are most pressing, regardless of "results."

74	I'm not trying to be snarky, but EPA staff value technical competence - particularly from their leaders. Here's an example of what I mean: https://hbr.org/2016/12/if-your-boss-could-do-your-job-youre-more-likely-to-be-happy-at-work And to be more specific, I worry that our top leadership (the few that have arrived) do not and will not possess technical competency with the work we do. I fear they will not value technical competency nor be particularly interested in it.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
75	74	5/2/2017	EPA sorely needs professional document management software. Without it, we are ill prepared for FOIA requests, discovery in litigation, and basic office management, and we spend enormous amounts of time manually doing what proper software would otherwise do for us. This has not been possible despite years of requests for it.	By strictly adhering to the principles of transparency, sound legal process, and scientific information. The EPA is losing credibility when it rejects scientific consensus and panders to polluting industries, as is increasingly the practice of new political management.	EPA constantly receives complaints and concerns about environmental and public health threats. Due to severe budget restraints, we are able to act on only a slight fraction of such citizen concerns, and in many cases the States also cannot act. EPA must maintain capacity to respond to the majority of such concerns, and this includes inspectors and travel budget.	The question presumes that there is adequate environmental protection for Americans. There is not. The EPA's budget has been woefully inadequate for years, and there are no opportunities for meaningful savings that would not further compromise people's health.	If EPA is serious about being more effective with fewer resources, then it should continue to use "Next Generation" compliance approaches as laid out by the prior Administration. This would include requiring polluting industries to report--to states, EPA, and the public at large--on their polluting activities. Such reporting has been shown to prevent noncompliance in the first place, and the reported data is invaluable for appropriate rulemakings.	The question presumes EPA has discretion on its jurisdiction and statutory obligations. We do not.
76	75	5/2/2017		Step up EPA oversight and enforcement under the Safe Drinking Water Act, especially small drinking water systems. We must allow no more "Flint, Michigans" to happen on our watch. Make this a top priority. Reassign staff and managers from other programs to work on this, if need be. The public is depending on us, and will not tolerate unsafe drinking water anywhere in the USA.	Keep the regional EPA libraries open to the public and fully staffed. In our region, library staff answer calls and emails from the public. We can't let our responses to public inquiries get backlogged, because that appears to be unresponsiveness to the public.	EPA employees' personal safety is important, but do we really need so many private security contract employees in our leased space? In our regional leased space, they seem to duplicate the work of the building owner/manager's own security guards and staff.	Drones could be used to sample air emissions around the fencelines of factories, refineries, and other regulated air emission sources, as well as schools and neighborhoods.	

AMERICAN OVERSIGHT

75	One practice from other agencies and the private sector that works well is to appoint leaders to run the organization. OECA is suffering from a total absence of direction from or time with the new political management. It is a fantasy to think we will become "efficient, effective and accountable" when you deprive us of basic leadership and direction.
76	Our Assistant Regional Administrator (Serena McIlwain, Region 9) has introduced the Lean Six Sigma process. It has already been very effective in our regional office and it should be extensively used to streamline operations in EPA HQs. If reductions in staffing are needed, look for them in HQs. Our region has already suffered from the previous VERA/VSIP two to three years ago, which has reduced our staffing levels substantially. And now another round of VERA/VSIP is proposed. This should only be used as a last resort (to avoid RIFs) after Congress approves our FY 2018 budget, not right now.

77	76	5/2/2017	better computer system with fewer malfunctions	good liaison; obtain knowledge from people on the scene	See No. 2.	People move from staff to supervisory positions. In making such moves, they normally obtain a higher grade. If they surrender being a supervisor, they should revert to the previous, lower grade. Under current conditions, they do not. They are being paid as a supervisory without those duties.		Coordinate with FDA and USDA.
78	77	5/2/2017	Responsibility for personnel actions was shifted to shared service centers (SSCs) in 2009 with the goal of performing these functions quicker and more efficiently. Instead, the SSCs have become somewhat of a bottleneck to getting work done. Regions have had to maintain HR staff in order to help get actions through the SSC. As a result, it now takes more FTE and twice the time to process personnel actions. The SSCs have worked well for travel voucher processing, but not for HR actions. Restoring personnel processing offices in Regions and AAships would be more efficient.	EPA approval of state CWA 303(d) impaired waters lists is a contentious process with little or any benefit to the environment. We should either do away with the EPA approval step entirely or make approval automatic unless the agency takes a disapproval action within a limited amount of time.		In addition to #2 above, EPA review of USACE draft CWA 404 permits is a resource-intensive and sometime contentious process. If the Corps is the permitting authority, they should bear the responsibility for CWA compliance, not EPA. Better yet, if states could be given incentives to take delegation of the 404 permitting program, that would be even better. Currently only 2 states nationwide are delegated for CWA 404.	many of our data systems are outdated and don't communicate with each other. Bringing our data systems up to date would be a good investment for us, our state and tribal partners, and the public.	
79	78	5/2/2017	Too many mid-management layers. There is NO need to have a branch office between division and section. A good employee to manager ratio should be 1 to 11, i.e. every 11 employees for one first line supervisor/manager. Eliminates the branch office layer.	Authorize states, tribes, local communities, or the private sector to detail their employees to EPA offices/regions so they can work side-by-side with EPA employees to resolve EPA issues.	Conduct quarterly customer support forum, and invite our states/local partners to the forum to discuss customer service improvement needs.	Expand EPA???s National Environmental Information Exchange Network to environmental protection authorities of foreign countries.	Make GIS environmental information accessible via mobile devices.	Consolidate 10 regional offices into 5 mega geographical EPA centers, i.e. the Eastern Center, the Western Center, etc???

80	79	5/2/2017	Almost all obstacles emanate from OARM. OARM's archaic and inefficient processes in OAM & OHR prevent staff from performing their primary missions. Purchasing, contracting, recruitment, employee development and training, and disciplining poor performing/behaving employees all suffer due to a lack of competency and expertise in organizational development. The biggest obstacle is procurement and acquisition regulations and policies that make purchasing slow, long, laborious and highly inefficient. Most issues arise from the Federal acquisition Regulation but OAM adds tremendously to the burden due to EPA's risk averse culture. Ultimately we need a major rewrite of the FAR to allow the government to purchase under standard business procedures. This would allow organizations to purchase any item or service they need, when they need it immediately with a credit card and not have to write volumes of text to let companies bid. Give senior managers the credit cards and the approval	Lift collaboration restrictions on EPA employees. Too many restrictions on our people that other federal science agencies do not have.	Lift collaboration restrictions on EPA employees. Too many restrictions on our people that other federal science agencies do not have.	We can reduce costs and inefficiencies without sacrificing environmental protection. Hire the people with the right skills and leadership ability to hold the workforce accountable and strategically plan and remove regulations and policies designed to keep every task slow and inefficient such as purchasing, contracting, hiring, EPA collaboration with non-federal entities.	Yes, tons but we need to go purchase them and we need to get rid of inefficient and unreliable FAR and OAM policies, so we can do this. EPA wastes time and money on outdated and useless IT solutions. Big companies use the best and latest software and apps to conduct business, we need to do the same.	Any federal science agency that does research on water and air should move to EPA so this research can be combined and done by one centralized organization. Regions should have more of a regulatory focus with mostly lawyers and scientists collaborating with states, tribes, etc. Create super regions to reduce duplication. Regions don't need labs. Emergency response and superfund employees can use labs in the private sector especially by eliminating ridiculous FAR requirements.
81	80	5/2/2017	Yes, EPA CID currently has the agents do car logs monthly. These logs were started approximately a year ago based off of recommendations by an Inspector General audit (it is not required by any statute or regulation). But almost all of the information in the logs track are already tracked electronically when pay for gas using the GSA card. Also Time keeping is tracked several different ways. We fill out a monthly activity report (MARs) for what we did each month. We also track our time in peoples plus, we also fill out leave slips. Everyone in all of CID acknowledges that the MARs reports are a complete waste of time and no one can ever fill them out perfect so all of them have mistakes in them. On top of that they are not used for any purpose other than a gotcha when management wants to mess with someone. They also take each agent about 4 hours a month to fill out. So we have 150 agents x 4 hours at an average of $55 per hour that works out to be the	None	None	Yes our hiring process is terrible. We need to be able to hire people who will work effetely for the agency with out the restrictions of only hiring vets or certain classes of people. For example we recently (with in the last 6 months) hired two agents in WV. Neither of them were from WV. The EPA spent over $100,000.00 training them at the FLETC and neither of them want to stay with EPA in WV so one is already going to another agency and the other has stated he wants to leave soon. These issues were oblivious before they were hired. But we were restricted in who we could hire so there were good candidates that did not get hired because of the hiring restrictions. So now we will lose the $ spent training	none that I know of.	For environmental crimes. I don't think you can state AG offices are not equipped or staffed to handle large complex environmental cases. No other federal agencies do environmental crimes other then the FBI and I have been told by several FBI agents that there management dose not want them to do environmental work because it is not a priority for them.

	A	B	C	D	E	F	G	H
82	81	5/2/2017	Physically working in the office reduces the amount of time I am able to spend on projects. For example, staff are required to attend several meetings per day, which requires several minutes to walk, catch the elevator or stairs, etc. Now, this may not seem like a lot of time, but let's say a typical staff member attends to meetings per day, requiring approximately five minutes to arrive and return to his or her desk, totaling 10 minutes per day of lost productivity, per employee. Now, let's multiply that by just a portion of the workforce per day, 8,000 staff members. This 80,000 minutes per day, or ~1,333 hours lost per day from physically attending meetings. I'm not clear on the average amount of pay for the employees but we'll go with $25/hr just to paint a picture. That's $33,325/day or $866,450/year being paid in time for physically going to/from an employee's desk to a meeting space. These are very modest numbers and I would suspect they could be much higher, but there is a solution! Virtually meeting from an	No comment.	First, properly enter the digital era of the rest of the United States. Fully leveraging digital technology available to federal entities that streamline processes and promote a convergence of real-time customer service with the latest technology to provide an "easy to understand" methodology for doing business with the public.	Do you really want to spend all my time filling out this survey to provide the many opportunities to reduce costs, and more than maintain, but IMPROVE environmental protection? You can reach me at **[REDACTED B6]**	Do want an idea or a detailed plan? Let's start with, Stop printing anything! I don't want to hear that it can't be done. Several businesses in our country do it and it leaves a better audit trail than the hardcopy way of business. It also sets up the agency for leveraging big data across agencies that would further allow for creating new efficiencies. The list goes on but my fingers are getting sore from typing. If I were able to dictate verbally into this machine, I would have been done with this survey much sooner. I can dictate an entire document on my smartphone in minutes, yet we still type everything.	Big data; centralized and open. Mandated open data architecture is a start. For example, if we need to implement a new database, require that all of that data is EASILY accessible by other agencies and state partners. If our data is open and available, States could actually implement processes more efficiently and take back some responsibility.
83	82	5/2/2017	As a scientist in the field and at the bench, the paperwork keeps becoming more and more burdensome. I understand we need QA/QC for science, and we've always had that, but it seems we get told to do more and more paperwork or paper trails for just that, which takes way too much time and thus lessens my actual time I have to spend doing the hands-on research. And then ordering supplies, that's yet another feat, not to mention if something has to go through EAS, then there's even more documentation. Not only does that demand my time and writing those documents, then it takes months to even receive the item that goes through EAS after numerous reviews. It's not the scientists fault or the EAS person. It's the load of required documents plus more and more reviewers in the tier of the agency. Do you not trust us?? I imagine someone in an upper level position has no idea what the equipment even does, and yet there are numerous people assigned to review the EAS orders. There's been many times I've had to	My project does partner with states and communities. I don't really need to improve on that as I have a Regional partner that is in frequent communication with the local states and community organizations regarding their concerns over an urban polluted watershed. I however, work at an ORD Division but I have great partnerships with Regional program offices.	My project also has a Citizens' Science component so we are in the community at least twice/month. The community knows we are doing our best to solve their pollution problem, we involve local volunteers including middle school students, college students and retired citizens. However, most of my colleagues at my Division do not have a Citizens' component in their projects. Maybe it should be encouraged, if possible? Some of the public may have a mis-conception about scientists or EPA in general. When you're in their community and they see you get dirty, sink in the mud and are an approachable person that is concerned about their livelihood, they want to be a part of what you're doing to help them.	It would greatly reduce costs by reducing administrative burdens as you lose that salary per hour time by having scientists too burdened by admin requirements. This has gotten so much worse since ORD went to their so called "efficiencies" program. They took away all of our local admin staff and distributed them across ORD. Half the time, I don't even know who to contact, so it wastes my time trying to keep up with it all. Before that, I just walked to an office of someone down the hall and gave them the paper or request, and it was done! And once the "efficiencies" program was created, then more and more supervisors were hired for each of those programs. That was insane! And if that wasn't enough, then ORD

84	83	5/2/2017				CERCLA, i.e. Superfund law, needs a overhaul. While Superfund may be great for addressing large contaminated "mega" sites, I believe its a poor mechanism for dealing with small residential/commercial/Industrial areas with limited types of contamination where usually a dig and haul or cap in place remedy is what is needed. A more efficient mechanism, such as an expanded removal program or a "Superfund light" program, would better address the contamination while reducing the cost, reducing the amount of time exposure remains to site contaminants and provide better reuse/revitalization opportunities.		
85	84	5/2/2017	The procedures that have been put in place since Jan. 20, 2017 involving briefing and consulting with the political staff in HQ before certain sorts of enforcement or programmatic actions are taken by the Regions, and the time that then sometimes elapses before the Region gets an answer from the HQ political staff, are very inefficient and are delaying our work to protect human health and the environment and our service to communities. It is highly inefficient to require this much case-by-case consultation, followed by slow response times.	It is absolutely essential that EPA maintain its roles of: 1) setting national standards, consistent with federal statutes, that all states and regulated parties have to meet; 2) setting consistent enforcement and compliance expectations for the states; 3) overseeing the states' implementation of delegated/authorized programs and of federal grants; 4) being a backstop of the states by bringing federal enforcement actions in appropriate cases in delegated/authorized programs, in consultation with each state (in addition to the enforcement actions EPA brings in the "Direct Implementation" programs). If EPA doesn't do all of these things, then there is a great risk of there being a "rush to the bottom" among the states, as they will not want to put themselves at a competitive disadvantage relative to those other states that apply a	The single most important factor to ensure better customer service is to ensure that EPA's environmental programs, and EPA's state and tribal grant programs, are fully funded. Making a significant cut to EPA's staffing and, at the same time, making significant cuts to EPA's grants to the states is a guaranteed recipe for worsening our and the states' service to our customers. A second factor that is key is the need for EPA to conduct regular outreach to states, tribes and the regulated community regarding environmental requirements that need to be met (especially when new requirements are taking effect) and about EPA's compliance expectations. With regard to the public at large, EPA and the states must continue to invest time and resources in holding public meetings, seeking public input, and providing timely information to the public via web sites and other mechanisms.			I don't think we can. It is a fallacy to think that there is currently some significant duplication of effort between EPA and the states, or that EPA is investing a lot of resources in work that the states can do by themselves. If this were true, then the states would already be doing more than they are doing! The states have significantly limited funding and limited expertise. If EPA disinvests, then either the work is not going to get done at all, or the states will be put under much greater resource pressure and be forced to do triage in their work. Either way, there will be a loss in public health protection. EPA

AMERICAN OVERSIGHT

	I
84	
85	It is crucial for EPA and the states to ensure that there is a level playing field across the country, in terms of environmental requirements. If the regulated community were to start getting the impression that environmental requirements are not going to be enforced in certain states or regions of the country, it will make our job much harder and ultimately increase costs and inefficiency. The regulated community needs to have an expectation that EPA or the state may very well take an enforcement action if there is noncompliance; that way there will be more voluntary compliance, which saves costs in the long run.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
86	85	5/2/2017	We need better tools to manage electronic records. The lack of such tools creates significant inefficiencies in complying with requirement under the Government Records Act and the Freedom of Information Act. While this may cost something on the front end, significant cost savings would occur thereafter.	Continue to sustain strong working relationships with these stakeholders. Face to face meetings, trainings, and work groups focused upon specific issues foster good communication, understanding and finding creative solutions.			Better records management.	
87	86	5/2/2017	Requiring grant recipients to submit MBE/WBE reports. This would be a burden reduction for the grant recipient as well as the EPA. Simply eliminate the requirement to submit the reports. The majority of reports have nothing to report but we are required to receive them and enter zeros for reporting into the IGMS Post Award database under MBE/WBE tracking. Also, eliminate the need for states to submit PreAward compliance Reports, EPA 4700-4. This is a Civil Rights report required for all grant recipients however EPA doesn't do anything with the reports. They go to our Civil Rights office to sign and returned to file in the grant file. This would be another burden reduction for EPA and grant recipients.	Eliminate unnecessary "red tape" such as the above forms which are unnecessary and thereby allow our partners to focus on the environmental results rather than unnecessary administrative requirements.	I think EPA does an excellent job of providing customer service to our grant recipients. However, housing all of the Tribal grants out of one office may provide better service to the Tribes since they are unique.	Elimination of Radon grants. Funding was to have been eliminated almost 5 years ago but because they government is always operating under a continuing resolution this program continues to receive funding. Eliminate voluntary program grants. These are usually low funded awards that produce very little environmental benefit. Programs include Pollution Prevention, Source Reduction, Environmental Justice and Environmental Education grants.	The use of GRANTS.GOV across the Federal government would be ideal and then one system for the Agencies to receive applications and award grants. I went to work for another Agency that did not have a grant system. The states had to use two different systems operated by the program offices rather than grant offices. One stop shopping would be beneficial to all grant recipients and the utilization of one system across all agencies would mean that grants could be processed across agency or assistance could be provided by one agency to another if there was a need.	Again, I would reiterate the need/use of a single grant system so any grant specialist could assist another agency through an Interagency agreement if one agency has a lull in processing and there is a need in another agency. If one system was used by all agencies we could cross those lines to provide assistance without having to "learn" something new.
88	87	5/2/2017	We all are required to take many trainings. Most are of some value, although when you add them all up I doubt they're worth all the time we spend taking them. One of them, the COOP training, stands out for uselessness. The training is boring, because it seems that the developers just plunked down text from a Federal guidance manual. And it's useless, because when the shit hits the fan, it won???t help anyone in the slightest to know the difference between a Delegation of Authority and an Order of Succession. The training should be dumped.		Everyone I know works hard to serve the public and our regulatory partners, and we get thanks from them for it.		EPA should expand and encourage the use of cloud computing instead of traditional hosting at NCC. Cloud computing is cheaper, more versatile, and more adaptable than traditional hosting.

89	88	5/2/2017	The EPA has done a pretty good job of doing this over the last 30 years.	States usually want EPA to be the bad guys when making companies clean up sites or when it comes to enforcing the law on a recalcitrant violator. That way state programs escape political repercussion from other state programs and the governors office and do not have to deal with the state politics. That is how it works.	A better work ethic must be installed in folks and that needs to start at the TOP.....President, senators, congress, appointees, etc. Not passing budget and going home for Thanksgiving, Christmas, Easter, etc. shows exactly the work ethics of the federal government at the top...who should be setting a better example. Until that changes and our representatives can lead by example, I really doubt much will change. Folks with a good work ethic will always have a good work ethic regardless. Folks that need to be ridden to have a good work ethic wont until ridden and the way our leaders are going and riding, looks like that may not happen for sometime.	Hire better educated/dedicated employees. The veterans preference makes it where the most qualified person is not always hired. The military should not hand out disabled veterans preferences like candy to folks who really are not disabled.	Doing that.	The EPA is like .03 percent of the budget. If EPA is realigned into another agency, EPA's mission will likely be forgotten. That is why each agency has its own mission. Prior to the creation of EPA in 1972, there were several environmental laws/programs that were aligned under other agency authority (Dept of Interior, National Parks, etc.) It did not work that way and that is why EPA was created, to provide a clear mandate to help provide clean water, air, and land to citizens of the US. If EPA is combined with the military, we will just more weapons. Good weapons are great but so is clean water.
90	89	5/2/2017	Redundant time entry requirements, training databases (for tracking training) and even training requirements. Develop working groups focused on finding and fixing these throughout the organization.	develop environmental task force/working groups within every state. Ideas can be shared, cross-training can occur and overall better relationships can be built. Also, seek to solicit this same information from the various state environmental offices...see what they have to say	Ask these groups what they want/expect from the EPA (more than just grant money). What do they want the EPA to do for them, the ultimate customer?	Re-organization throughout the agency. There seems to be redundant programs in several areas. Look into creating "Centers of Excellence" throughout the country, that focus on issues from a national perspective vs. just at a regional level. Also, better leverage technology, especially in tracking training, equipment, etc.	Again, I think technology can improve efficiency, but also improve moral. The less times an employee has to document or track information, the more efficient they are. As an example, EPA has a learning Management System (LMS), yet there are various training requirements that are not loaded into or tracked in LMS. This requires the originating office to send out an email instructing all required "attendees" to take the training, then the employee must print, scan and email the certificate to someone for tracking purposes. Why not leverage the system already in place to do all of that? This is one small area where resources can be saved, through the use of existing technology...which is not

91	90	5/2/2017	The final clearance and issuance of the Revised Federal Cross-Cutting Authorities Handbook has been delayed for over 4 years. This has left states and EPA staff without the proper guidance and knowledge to ensure that entities are aware and complying with all federal requirements under the State Revolving Fund programs.		I suggest combining the operations of the EPA Clean Water State Revolving Fund Program and the Drinking Water State Revolving Fund Program. There appear to be real opportunities for achieving efficiencies and economies by moving toward the combined operations of the two SRF loan programs at the federal level. EPA could achieve efficiencies in its own Clean Water and Drinking Water SRF management by combining the operations at headquarters where two separate SRF operations are maintained within the Office of Water. A cue can be taken from many states and EPA Regions that are already demonstrating an effective and efficient use of resources along with efficiencies both in financial and programmatic management through the combined operation of their loan programs (CalEPA, California State Water Resources Control Board, Division of Financial Assistance and EPA Region 9 are excellent examples	See Comment in Q.3 above.		
92	91	5/2/2017		Focus on the important aspects of a regulation, don't sweat every detail - especially when auditing a program. Giver direction to states on priority rather than "everything is important"	Providing more travel money, especially when EPA has a directly implements a program, such as for tribes	Improve CONCUR travel, get more assistance with travel so someone familiar can assist rather than a GS 13 spending hours trying to solve a problem	Drones to do inspections	Combine the CWISA (CWA infrastructure) program with Indian Health Service,
93	92	5/2/2017	FTEs for the Superfund program are spread around EPA. In the early days while the Superfund program was relatively well funded the other programs were not. However, now that most of the EPA programs are state delegated, those Superfund FTEs and dollars would be much better spent by the Superfund program.		Provide more money for EPA staff and/or contractors to provide more classroom training. Travel funds are an issue for EPA HQ staff to travel to provide training (we are not allowed to use travel as training funds when we are giving training, only when we are taking training). Training we provide at regions or conferences can provide better service to regions, states, tribes, local officials, PRPs, and contractors.		Please do NOT listen to our IT contractors on their ideas on better equipment/software. This Drupal fiasco is still causing problems.	We did a lot of realigning in Superfund back during the administrative reforms of the 1990's (increased state/local role on land and groundwater use expectations, state concurrence on NPL listings, etc). Seems to have worked well

AMERICAN OVERSIGHT

94	93	5/2/2017	Localize control of our budget. The ability to move funds where needed would greatly improve efficiency.	EPA office in each state which partners with state environmental agencies. EPA 's role would be that of advisor, use funding "opportunities" to help "guide" programs.	Local control of state offices, give the people a sense of shared responsibility.	Eliminate "if you don't spend it you don't get it" mentality. Allow unspent funds to "roll over" into a capital equipment fund for technology upgrades.	Have an audit performed by an outside agency adopt "good science" practices.	Each state have its own EPA office.
95	94	5/2/2017	Political interference in enforcement cases often causes inefficiency. Political feedback belongs in the rulemaking process, but not in the enforcement process. Enforcement of existing laws should be left to enforcement officials, without input or intervention from political appointees. This is true for a few reasons. First, it is fundamentally unfair that well-connected defendants are able to exert political pressure on enforcement actions, whereas smaller defendants do not have equal capability to do so. When politicals then act to intervene in enforcement actions at the prompting of trade groups or specific defendants, it creates an un-level playing field because larger defendants are able to influence and achieve better results for themselves than smaller defendants. Second, political intervention in enforcement cases is very inefficient. It drains significant staff and middle management resources to attempt to brief the full status of each enforcement case to the political appointees, who should be occupying	State governments are frequently beholden to industry, even more so than EPA (which is not immune from the influence of defendant or trade group lobbying efforts). The EPA should step up its efforts to serve as a backstop of national consistency where state governments are politically incapable of ensuring compliance. On the other hand, some state governments actively serve as laboratories for the development of regulations that prove effective at furthering environmental results in a manageable way. For example, the State of Colorado has developed a robust State Implementation Plan for regulation of oil and gas well pads. The EPA should work with states, like Colorado, to continue to develop and adopt sensible, effective regulations that have been proven at the state level into federal regulatory requirements. In this way, states	The EPA provides customer service by: 1) being a leader in the development and oversight of regulations that push industry to achieve environmentally protective practices; 2) effectively enforcing those regulations so as to maintain a level playing field among states and companies; and 3) developing sound scientific knowledge to support identification of potential harms from pollutants so as to set standards to ensure that the public is protected. The EPA could spend more efforts to further any of those three objectives, and that would improve the customer service (i.e. protection and expertise) received by the states, tribes, local communities, regulated community, and the public at large.	In attempting to provide flexibility, our regulations become overly complicated. It would be more efficient if we were to write regulations with clear requirements that did not attempt to provide exceptions or alterations for particular contingencies. My understanding is that many of these inefficient changes happen during OMB review for cost-effectiveness. In carving out exceptions and allowing alternatives, we should keep in mind the added costs of reduced regulatory clarity and simplicity.	We would be more efficient with a higher budget. Because of budget cuts, support staff positions have largely been eliminated over the years. This means that engineers and attorneys are forced to use their work time to do ministerial tasks like word processing tasks, photocopying, mailing, booking travel, etc. Increasing our budget and hiring more support staff would help free up time for professionals to work on more complex matters within their field of expertise.	EPA is a resource to other federal agencies and states. Where appropriate, we partner with those entities to achieve shared goals. Our resources then supplement their resources. We provide expertise and guidance in implementation and oversight of our statutory authorities. Even in areas of shared responsibility or mutual interest, cutting our activities will only place greater burden on the other federal agencies or states to pull more weight, or will lead to a situation where that work goes unperformed and neglected. Likewise, increasing our activities in those areas of shared responsibility and mutual

95	My ideas have been covered by responses to the previous questions.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
96	95	5/2/2017	NA	More retreats and partnership building and outreach events to build relationships. Also, more grant funding from HQ.	More outreach events and speaking engagements. We especially need to be more present at local schools and colleges., giving talks in the science rooms and having a presence at events such as Earth Day and Career Fairs.	Definitely need to tap into the Work At Home option. It saves $$ on commuting and it can also be a huge $$ saver when you account for less office cubicle spaces.	Newer computers and laptops. We also need to provide more staff with EPA blackberries.	In order to leverage our authority and accomplish more, we need to have more partnership building retreats on an annual basis with our sister agencies, such as the Army Corps of Engineers and US FWS. Buidling strong partnerships helps us get our job done easier and it saves time and money for applicants as well, when they don't have to wait so long (sometimes years) in order to have EPA and Corps get on the same page about a project. Many times EPA and Corps are at odds more with one another than w/ the applicant. This is easily solvable by doing more to build stronger relationships.
97	96	5/2/2017	We've been required to take a lot of trainings which take time away from our work. Some of these are necessary but I think there are like 5 or more trainings such as annual ethics training, annual computer security training, annual continuing of operations training, annual records management training, working effectively with Tribal governments, and others. Maybe we don't have to take these annually? Our performance evaluations are a headache and demotivational. How many times do we need to be asked what we are doing? Why do some people get all the plum assignments while others get all the work? Doubt that will change but a management culture of encouragement and motivation is better than constantly being beat on for a couple of decades. It get's tiring. No appreciation or understanding of good work. Politics rewarded most and I don't expect that to change.	Some of the water grants are poorly researched prior to being awarded. The grants are for worthy causes but money may not always be well spent as projects aren't always completely thought out before being granted. Some of the grants to organizations which have minimal environmental skills. These grants best awarded to more scientifically qualified individuals and organizations for max benefit (e.g. those with scientific/engineering backgrounds).	we work closely with States and Tribes. Tribes seem to privately appreciate our help while publicly criticizing us. They have a great need for assistance. Some tribes would rather not deal with us but I don't think that is really in their best interests. States can be hard to deal with. Some are very strict whereas others very lax. Some over-enforce laws while others don't enforce. Not fun. It's a process. I feel bad for regulated community because cleanup costs can be very high and public often has misunderstanding of actual risks from sites and can get very agitated. More cost effective remedies is recommended. Better communication of risks to public also recommended.	Each Region has it's own analytical laboratory (10) and for Superfund they have the National Contract Laboratories. The work overlaps and is duplicative. Both could be eliminated and private labs could be contracted on an as needed basis through subcontracts. Quality of work could be diminished however due to less direct oversight because of lax State oversight of labs (private labs not overseen by USEPA).	Actually the old technology Lotus Notes was better than our new technology "Microsoft Office/SharePoint." Although the new service make data sharing easier, it doesn't not have the database capabilities as Lotus Notes. To replace Lotus Notes one needs to reprogram hundreds of dbases in Access and we don't have the staff for that. Even our new email system "Outlook" is not as good as our old one "Lotus Notes" Suggest reorganizing HQ IT Office that makes all those bad decisions for us. Really need to ask the end users what they need rather than having HQ tells what we need. Also, we use to have an onsite contractor to manage	I think we already do a lot of that. What the States don't want or won't do, they give to us to do. Seems we defer to the states a lot. Also DOD facilities have primary responsibility for Sfund cleanups but they really don't have the expertise and there is a lot of waste that results from that. DOE facilities somewhat too, although they have some very nasty sites which of course are very expensive to cleanup.

AMERICAN OVERSIGHT

	I
96	Places like Deloitte Touche hold annual classes that they call DT school..... in order to not only build their own employees, but also build partnerships across the industry. We need to create this type of atmosphere at the federal agency level, so that employees not only build on their skills, but also build stronger partnerships. This type of relationship building ultimately helps agencies understand each others missions better and help work more united, saving time and money, and creating much more efficiency across the board.
97	We "consolidated" some of our services to Cincinnati and Las Vegas "service centers." and quality of service really dropped. Don't know how much cost savings was achieved but if you have to send a dozen emails to get your travel voucher improved, it's very frustrating and inefficient. We switched are payroll system around a few times and it went from good to horrible to better now. Forget which system was the bad one. I think we have PeopleSoft now which is OK but there are something like 200 payroll codes you sometimes need to figure out. Best idea is don't create softwarwe in house. EPA is not a software company. Private sector is much better at software design.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
98	97	5/2/2017	Centralization of administrative support for travel, personnel, contracting leads to more difficult administrative work.	1) Enhance our social science capacity so that our interactions can be even more rigorous and so that our capacity to draw inferences from our interactions is enhanced. 2) Ensure that partnering is rewarded in TQB decisions and 3) Ensure that funds are available to support effective collaboration.	1) Ensure that staffing is available secure and rewarding for this collaboration 2) Ensure that programmatic direction is clear and viable over the long term, and 3) ensure that funds for the support of these interactions are more than sufficient. 4) Promote people who take care of our customers	Support national scale environmental accounting as an aid to strategic decision making.	1) Integrate IT systems and ensure that they are friendly to even infrequent inexperienced users 2) Technologies that underlie national scale status and trends reporting on environmental status need to be expanded and nurtured. The accounting that such technoligies provide is essential for the strategic allocation of management talent and a wide range of state tribal and Federal resources.	1) Support travel to professional meetings where collaborations can be developed and cultivated across agencies. 2) Hold national, state and local workshops to focus on this potential 3) Support ECOS and other similar organizations.
99	98	5/2/2017	Job categories that follow 1940s formats and don't encourage x-program work or acknowledge that employees in one category (eg. environmental protection specialist) CAN in fact do a job that an engineer is doing need modernization.	Allow us to do our jobs and implement our regulations. Removing regulations do not help build partnerships to achieve better environmental results. Provide funding to support partnerships that develop analytical tools, research effects of contaminants and activities on the environment and public health, coordination and activities of local watershed alliances, put local governmental protections in place, map out sustainable activities for smart growth, etc etc etc. We cannot partner without funds and employees with needed expertise. Both of these critical elements are proposed to be severely cut. That's why this survey seems disingenuous.	We already provide great customer service. Better service requires more employees who can travel (funding to travel) to meet face to face with tribal leaders, municipal governments, chambers of commerce, planning and county commissioners, land owners, etc. More employees and funding to help convene problem solving activities with interested groups and others who ask for help. We get a lot of requests for funding and technical assistance and don't have any discretionary funding like we did 15-20 years ago to help with a wide range of requests from all sectors; they loved our participation at that time when we had the people and funding to help.	Employees are incredibly efficient and skilled, but micromanagement creates the single largest inefficiency in the system. It's amazing that we have anything to report given the massive load caused by micromanagement. Ideas like using ADP to track activities that are already tracked in data bases built to track the activities will create enormous inefficiencies and are a symptom of further micromanagement and ignorance. We are already so reduced that we are cannibalizing program to program. There is no fat - no meat either. We don't have enough funds to even archive records according to regulations. Our computers are ridiculous. Other inefficiencies are caused by	Modernizing takes money. Given the proposed budget, this question can't be serious. We are limited by funding to use basic technologies that people have at home - GIS applications, advanced google earth type of technologies, a screen that isn't miniscule. The number of licenses we can have are very limited for say, adobe pro, for crying out loud. Our existing processes operate well if they aren't constantly interrupted by admin demands (see above) or shunted into centralized services that are understaffed. The main problem with current processes of any kind is lack of employees. EPA employees are plenty accountable - all the time - demoralizing and insulting	We do this already all the time, every single day. You can accomplish more with more employees who can create more partnerships. What do you mean by realign? We've been aligned for decades with our state and federal partners. We do this really well. I assume by "more" you mean meeting our mission better because there is a lot of the environment that is not protected by whole swaths of sectors and a lot environment that is contaminated and a lot of people suffering health impacts from unregulated sources of pollutants. Under that assumption we can do more by supporting the

AMERICAN OVERSIGHT

	I
98	1) Hire great young people and mentor them with our best. 2) Make a real emeritus program available to aging Feds comparable to that in academia 3) Support an extensive but competitive sabbatical program for managers and researchers.
99	Best practices are to have enough employees to do the job, honor the employees for their incredible skill, expertise, and dedication - they ARE the best in class - and give them the resources to do their job. Instead what this administration is doing is the opposite of well-known best practices for leading any organization to meet its mission; this administration is doing everything possible to prevent employees from doing their jobs, to prevent them from being accountable to the responsibilities the agency has to the American people, to degrade them and their efforts. There is an assumption that EPA and its employees are wasting money and not accountable or efficient which is

AMERICAN OVERSIGHT

100	99	5/2/2017	Waiting weeks or months for concurrence or approval to put a process in place. Also getting funding to implement new process that will automate and improve productivity.	Automating a lot of the manual process we do. By automating data input and data scanning would allow us to better find, respond, and enforce environmental laws. Also set up more web based data input from companies and states to decrease our time for inputting and sifting through data.	Working to automate data needed by EPA. Using that data to communicate changes that are needed to bring environmental change.	Again automating a lot of our processes.	There are technologies that allow us to enter data once and create multiple documents while keeping track of what we are doing. These are not being used enough. People are still creating documents manually over and over. And a number of them are not standardized.	I see the same and similar work being done across divisions in our Region. Why? If the work process is similar why are two or three different divisions working it when one one is necessary. Many times one area does not know what another area is doing. If information was shared we could decrease the number of people needed to process an action.
101	100	5/2/2017					A very large amount of time and money is spent responding to FOIAs and discovery for electronic documents. This will continue to increase as the volume of electronic records continues to grow exponentially. Most electronic documents are emailed to many different people and large email groups result in email chains with dozens of responses. Each persons email and electronic files with potentially responsive documents are searched separately and put into the database. The de-duplication software does not work properly and it is difficult to search departed or separated employees emails. It would save a lot of time, money, and resources if all of our documents, particularly	
102	101	5/2/2017	We need more admins.	More funding.	More funding.	No, we've already been milked dry.	How about current computers with updated systems and printers that aren't breaking all the time?

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
103	102	5/2/2017	EPA Region 9 simply has too many layers of management. We have section managers, ADs, deputy directors, directors, a deputy regional administrator, and an acting regional administrator. The ADs and deputy directors are not necessary and only slow down work flow, making our region less efficient. Rather than reorganize from within, EPA should hire an unbiased management consulting firm to make the tough choices.				We should stop using Concur and switch back to GovTrip for travel. Concur has wasted employee time, and time is money. The Outlook calendar and email is only available on a computer or an EPA issued phone. Assuming one is in the field and does not have an EPA issued phone, Outlook is worthless. I have to keep a separate calendar so I don't miss appointments. Urgent emails go unread. Either the technology needs to be changed or staff should be issued EPA phones to access their email and calendar.	
104	103	5/2/2017	The suspension of funding contracting actions in January resulted in significant delay in Superfund projects. Also the requirement to run all press notifications regarding Superfund sites through HQ is burdensome and can result in communication delays and delays in our ability to respond to situations. The inability to inform congress of what we are doing on Superfund sites in their districts without HQ approval also stifles open communication and does not serve the public well.	Best results come when responsible parties are willing and committed to cleaning up sites. However, this cannot be legislated. It depends entirely on the people involved. Where everyone is in agreement and working together for a common goal (e.g. cleaning up sites) results will be rapid and dramatically positive. If there are other priorities at play (e.g politics, divisiveness, profit motive, lack of money, lack of participation, lack of committment) progress will be piecemeal and slow.	Keep the EPA website information intact, uncensored and up to date. Scientific information should not be political	Invest in EPA as an investment in our future. For a few decades now EPA's budget has been cut back every year as we have had to do more with less. We are and have been doing less with less for some time now. Staff is extremely demoralized by the threats of 30% budget cut, elimination of programs and possilble RIFs. You cannot threaten people with possible termination and then turn around and ask them how to improve their jobs. This is no way to run an agency. this survey reads like a cruel joke.	None that don't cost money. Right now we need to focus on preserving what we have. Increasing EPAs budget and staffing to previous levels could make us more efficient , effective and accountable. At this point we can only do less with less.	Other federal agencies e.g. DOD has shared responsibility, but not necessarily mutual interest. This is evident in significant disputes and project delays despite more than adequate budget.

AMERICAN OVERSIGHT

	I
103	Pay-for-Performance. Currently, 1% of EPA R9's payroll goes to awards. If EPA wants to improve efficiency, we should consider increasing that amount to at least 10%. Incentivize performance. How many people work at EPA? Answer: About half.
104	We still have some best practices at EPA and unmatched technology and expertise; focus now needs to be on saving them for the future needs of the country. Nothing needs to be "fixed" - that is a big part of the problem when management changes, there is always a need to fix or break what isn't broken to begin with.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
105	104	5/2/2017	We seem to have a hard time getting direction from our political leadership on decisions they have asked to be involved in. I feel we are constantly providing updates to HQ on our work. A lot of information goes in, but we don't get direction back. Do we move forward? Do we take a different direction? This seems to be due in part to the limited number of people in our political leadership that we can get direction from. They seem overloaded with too much going on to make a decision and provide direction.	Inspectors spend a lot of time in the field and see where facilities have a hard time with compliance. EPA should fund travel for inspectors to give presentations to the regulated communities (industry groups, government groups, operator trainings, etc.) on common issues. We used to do a lot of this, but as our travel funds have dwindled over the last few years, we are no longer able to do this type of outreach. We could also do a better job of outreach to the general public. We need to provide general education on things they can do to help their air and water (knowing where the paint they wash down the gutter goes, knowing how to properly dispose of chemicals, etc.). Sometimes states need EPA to be the guerilla in the closet. We have had states ask us to step in when they can't get a facility to	You can only provide customer service if you have the resources to do so. We can only provide assistance or good information to the public, governments, etc. if we have the people, the expertise, and the other resources to do so. The number of people, expertise, and other resources has been on a downward trend for a long time, and our customer service has also gone down.	Require facilities to post compliance documents on their website. For example, construction sites would post their stormwater plan and self-inspection reports online. This public transparency would lead to better compliance, and EPA and states could do some limited reviews of documents in lieu of on-site inspections.	We need to have software to electronically concur on documents (permits, RODs, letters, enforcement, etc.).	I don't see any areas where our responsibility overlaps with other federal agencies. As far as states, we already have state delegated programs that have committed people. We let them do their thing unless they need EPA help.
106	105	5/2/2017	We are required to report on ACS measures to HQ for 3 quarters during the year. Suggest just reporting on ACS measures at the midyear and end of year. We also need access to people who can help us with database and other data management efficiencies. Many of us use manual processes to do our work, whereas people with programming and computer expertise could help create more efficiencies. We also would benefit from creating portals on our website, where people from outside EPA can submit documents directly to EPA through the website instead of through emails.		Better communication tools for sending outreach materials - bulk emails sent to many people at once, etc.	We are woefully low on staff, and need to hire more FTE instead of relying on SEE employees to do important work. SEEs have frequent turnover since they are paid such a low salary, and they don't have the commitment of regular FTE. There is a lot of required work that we cannot do since we don't have the FTE staff to do it all.	yes, better database efficiencies and tools as described above.	Other federal agencies or states cannot do the work that EPA is required to do by statute.

AMERICAN OVERSIGHT

	I
105	Our PARS have elements that are very measurable (# of days to draft or review a document; # of days to submit a form; do a, b, and c every quarter, etc.). I know not all groups have this. They don't have anything to measure outputs. I know not everything is easily measured (e.g., professional interaction with states, etc.), but there should be something measurable in PARS. I hesitate to say this, because I don't miss this tracking from the private sector. Billable hours
106	sadly, no, except the use of web portals to receive public info, as suggested above. That technology is used by the state of Colorado and Utah.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
107	106	5/2/2017	Currently, it is extremely difficult to get a management-level decision on any matter. This appears to be due to a perfect storm of several deficiencies arising since January 20 -- the sudden loss of managers with knowledge and experience in subject areas, the slow pace at which new leadership has been brought to EPA, the surprising degree of unfamiliarity of the limited number of new managers arriving with agency practice, information pools, and legal structures governing agency business, and the rather na??ve approach to top-down clearance of each and every item of import that new leadership appears to favor. So, my suggested solution if for EPA leadership to convince the WH to get its vacant political posts filled, so that the agency can at least begin to address the mounting backlog of decisions that need to be made post-January 20. Basically, the "improvement" needed is to return to the full strength we had before the inauguration, as efficiency and effectiveness have dropped off	One of the things that slows EPA down and makes it take longer and more money for us to make decisions is the absence of needed technical and scientific information. This is informational poverty that is partly our own making, as we do not maximize use of our legal authorities to direct others to provide needed info and data. For example, if we made earlier and more frequent use of our Clean Air Act section 1114 authority, it would not take EPA so long to deliver regulatory certainty in the form of regulations that are well-supported by real world data.	We tend to too freely fall behind due to our own resource allocations. We need to invest more money and staff into completing required actions even when the results of those actions may be politically unpopular. Better to take the action, let people who don't like it get their day in court attacking it, and move on, rather than keep everyone waiting and wondering.	Yes, we should follow long-standing OMB guidance and require those who benefit from some of our services to pay for them (e.g., polluting sources should pay for permits, as OMB has long said they should).	I am not knowledgeable on this subject.	We end up doing too much of the work that states should do, in response to states saying they don't have the time, money, staff or political courage to do it. We should spend less effort cajoling states into doing their own jobs poorly, and more effort holding them accountable for when the do not fulfill their duties. A way to leverage better state behavior might be the use, fr example, of discretionary sanctions under Clean Air Act section 110(m).
108	107	5/2/2017	1) IT approvals for non-standard software often take a very extended period of time once submitted to the IT deparment, even for free software. 2) Reevaluating the delegated authorities and delegating more of them down to as low a possible would also increase efficiency, and reduce stress on managers who have to review these documents. 3) Supervisors and Counsel often worry about formatting issues (margins, page breaks) during routing of correspondence, with no real change to content. An overall reminder to them that this would probably be better left to the final administrative reviewer on the routing chain. 4) A lack of administrative support. In my branch, 1 Branch Chief, 3 Section Chiefs, and ~33 staff are served by just 2 administrative assistants. In addition, their time seems to be stretched further by financial reporting requirements for purchases for computers and office supplies, these seem to be rather surprisingly burdensome.	If we make our expectations and regulations clear and understandable as possible, and are proactive in our messaging on those fronts, we can achieve better, more uniform compliance. That way our partners know what to expect. In many ways this process often feels like we are building the airplane in midair due to our workloads and lack of administrative support. Fully staffing positions and having less turnover and limiting the length of how long positions are left acting would help provide consistency as well.	Personally, I am in the process of crafting detailed and explicit clarifications and explanations on how forms and submittals need to be filled out and explaining terms and common errors. And include the procedures in our decision making process. I hope these walkthroughs explain the regulatory requirements and how to meet them. I'm also in a continual process of reformatting and clarifying the language in the permits I issue to improve readability and ensure that the states or regulated entities understand their responsibilities. Such documents will also help any member of the public understand these documents should they request them in a FOIA.	Reevaluating the delegated authorities and delegating more of them down to staff or managers as low on the chain of command as possible would increase efficiency, turn around time, and reduce stress on managers who have to review these documents.	1) The agency as a whole has woefully underspent on tech. We need updated and flexible databases & geodatabases (and the tech support to maintain and keep them current) to help: a) automate many routinized procedures, which may include allowing the regulated community to make digital submissions to reduce manual reentry of data and generating form letters. b) use our accumulated data to make better, permitting, enforcement, and regulatory decisions c) use more statistical and big data techniques to find underlying trends that are not apparent on surface inspection of data. 2) Where possible moving more of our administrative record into safe and secure	1) If we could have US Fish & Wildlife Service make the determinations for Section 7 of Endangered Species Act consultations, in the same way that State and Tribal Historic Preservation Offices make the Section 106 determinations under the National Historic Preservation Act that would help immensely. 2) Work with states on a more regular and consistent basis by forming more national technical work/support groups that help maintain the overall knowledge base (especially important due to institutional knowledge loss), help states share resources/expertise, and

AMERICAN OVERSIGHT

	I
107	Actually, OGC is widely regarded as the best environmental law shop in the US, and therefore in the world. It would be unfortunate if we were to pick up the bad and wasteful habits of private law firms, especially if as with private clients our own public clients have to bear the cost of such self indulgence.
108	1) Consolidate all training requirements for better tracking. SkillPort does this to some degree, but many trainings are still not incorporated into skill port 2) Establish more SOPs and require them to be reviewed on a regular basis to keep up with regulatory, technical, and business administrative changes. 3) One pet peeve, change the correspondence manual to include the oxford comma. 4) Establish more correspondence templates that contain standard formatting styles (including linked headers) to allow for easy generation of accessible pdf documents while maintaining brand/style standards. Include these on all MS word installs.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
109	108	5/2/2017	(1) It is highly inefficient to ask professional staff to handle their own travel in Concur, deal with ordering supplies, and other administrative tasks. We need more administrative staff who can handle these kinds of duties so professional staff can focus on their jobs. (2) Get rid of all but a few of the mandatory trainings in Skillport. They are a waste of time if you don't work in that area. Harassment - yes, we should all take that. Working with tribes - this is not relevant to many staff.	(1) Continue to wholeheartedly support the EPA-HUD-DOT Partnership for Sustainable Communities, which has had superb results and provides a model for federal collaboration. Talk to the mayors of Cincinnati, Kansas City, and Little Rock if you want verification of the excellent work they do. (2) Be sure that all programs have proven performance measures associated with them. How do you know a program is effective in improving human health and the environment if you are not measuring the results in a scientifically driven way? Every program should be able to determine for itself what works best, but every one should also be accountable for providing measurable results. Emphasizing this and providing training for managers would be helpful. (3) The new Administration should consider FAR MORE CAREFULLY	(1) HQ should return its focus to EPA's core mission - improving human health and the environment - instead of focusing on how to improve conditions for business. While I see the sense of ensuring that regulations do not impede business when possible and there could be some good outcomes from an in-depth look at this topic, no one thinks the new Administration has any real interest in being balanced or fair. EPA's primary mission is to protect the physical environment, not the business environment. This new focus on helping industry is highly disturbing - to EPA staff and to the many grantees I work with who count on those regulations to protect their communities. (2) EPA staff are largely mission driven. They care deeply about their work and work hard to deliver excellent results. EPA also has enormous professional and technical resources that our customers do not have and look to us to provide. I see enormous	(1) Allow staff to transfer between the regions and HQ more freely. It is extraordinarily difficult to move between regions or from HQ to a region, which means you lose staff or are unable to harness the talents of staff with just the right skills in other offices. (2) Make it easier to bring on interns and volunteers. It is so difficult right now, which is extremely inefficient when good people can be brought in to do great work for free or very little money. (2) At the same time, we keep on some staff who are known to be incompetent but are protected by union rules. It is almost impossible to get rid of people who are inefficient and a drag on the Agency. Find ways to remove these people, please. (3) We have many	Identifying technologies is easy; assessing, adopting, and rolling out new technologies and processes is the hard part. Start with hiring more staff, especially IT staff, who can do these jobs well and then you can think about bringing on more technologies.	Look carefully at how the Partnership for Sustainable Communities has been functioning (which has operated through the Office of Sustainable Communities). This is a great model.
110	109	5/2/2017			EPA senior leaders should consult the US military services about their beliefs about the existence of man-made global warming and its threat to US national security. Reportedly the US military services have rated an environmental problem, global warming, as the greatest current threat to US national security, greater than any political or military threat, including terrorism and unstable nuclear-capable governments. EPA cannot serve its customers, namely the entire US population, if it ignores the largest environmental problem in existence in the US, and the greatest current threat to US security.	The agency would benefit financially and the public would benefit through better customer service if the agency underwent a systematic nationwide project to scan our existing paper records, ship the paper versions of the records to an off-site Federal Records Center, and then post the electronic versions on-line for EPA staff and the public to access, for the following reasons: ???Managing paper records is costly because regions and offices pay rent per square foot for the space that records occupy at the same rate as our rent for staff offices and conference rooms. Scanning paper records to convert them to electronic format, and then shipping the paper records to an off-site Federal	Scanning technologies to convert paper records to electronic format, which will reduce EPA's costs to store records and to respond to Freedom of Information Act requests.	

AMERICAN OVERSIGHT

	I
109	The question is so unrealistic. EPA barely has enough money to keep its current program running or current staff on board. How are we going to afford the cost of bringing on best of class anything when we can't even afford to hire or keep best in class employees? Don't tell me we need to be leaner - we are sliced as thin as we can possibly get.
110	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
111	110	5/2/2017	1) Most offices have the ability to go paperless. However, old school, 19th Century management resistance is hindering this transition, even after they have been given the blueprints on how to convert all their processes paperless. Leadership must demand paperless processes be implemented, at all offices. 2) Leadership should encourage all offices to telework more. It increases morale and helps to maintain worthy talent, while costing the agency nothing.	Going paperless (with all processes) and increasing telework opportunities would enhance customer partnering, by providing timely and accurate data when they need it and would increase transparency.	A paperless office allows everyone access to all required documents from anywhere. Any person, with access rights, could assist any customer from any region, tribe, and/or community. Additionally, auditors could review an agency's processes without having to travel to an office's location (this would be a huge travel expense saver).	Expand telework opportunities (at local offices and for individuals to work remotely for other departments...the EPA has a wealth of talent - and we all don't want to live in DC). Also, teleworking reduces traffic congestion, reduces pollution, decreases the likely hood of someone being out of work due to a traffic injury, and provides a larger talent pool to choose from.	Obligate funds electronically. Currently, docs are printed and hand-stamped to show that funds are obligated. This is such an antiquated/outdated process. This can be accomplished and docs stored electronically, without printing the docs. No new technologies needed to implement this paper and ink saving process.	Hmmm....
112	111	5/2/2017	Filling out surveys designed to implement poorly thought-out executive orders from a president neither knows nor cares anything about the value of the work EPA does takes time away from real work, though it seems valuable to counter the preconceived ideas of the current EPA political appointees.	Sufficiently funding Congressionally mandated grants from EPA to the states, tribes, and island territories, such as the state revolving funds for wastewater and drinking water infrastructure, the public water system supervision grants, brownfields grants, tribal GAP grants, and others, would help EPA achieve better environmental results through its partners in environmental protection.	Sufficient travel and conference funding for EPA Offices and Regions would allow staff and managers to meet more often with EPA clients, to share information with them in person and to learn their concerns and needs directly from them. Providing and maintaining science-based information, unfiltered by political ideology, would certainly provide better service to the public at large than the censorship and removal of taxpayer-funded information from EPA's web site that is now occuring.	Fundamentally, we need senior-level managers that believe in, promote, and implement EPA's mission to protect the environment on which public health depends. It is a complete waste of personnel funding to pay salaries and benefits to appointees whose past record is obstruction and current goal is dismantling of environmental protection to benefit their parochial special interests.	Certainly, EPA is constantly testing and adopting new technologies and improving processes that protect the environment. Establishing a social cost of carbon that accurately estimates the health, economic, and social costs of climate change is an excellent example.	In many ways, given sufficient funding and management vision. For example, EPA could partner with DOE's National Renewable Energy Laboratory to develop and encourage adoption of new energy-efficiency and renewable energy production technologies.

AMERICAN OVERSIGHT

	I
111	1) Standardize grant payment process by mandating all grant recipients use US Treasury's ASAP system to receive payments. This would eliminate paper payment requests forms, and increase the timeliness and accuracy of available and distributed funds in Compass Financial.
112	Yes, the Ecological Footprint is a best-in-class indicator of the sustainability and equity of current resource use patterns across current geographic and political boundaries and across current and future generations. EPA should adopt the Ecological Footprint as a fundamental indicator of our society's environmental performance.

113	112	5/2/2017	The Paperwork Reduction Act should be repealed. We should be able to conduct surveys and gain valuable input from our stakeholders without being limited to the restrictions and burdens of this outdated Act.	There should be one program that tribes could apply for to acquire federal waste management funding. Many federal agencies fund different and sometimes overlapping aspects of waste management, which makes it burdensome for tribes to apply for several sources of funding. It is inefficient and unsustainable to expect tribes to apply for piecemeal funding, something that state governments didn't have to do when their waste management programs were first being developed. Federal agencies should pool resources into one program to dedicate to tribal waste management, which is the least funded program of all tribal programs. This would achieve better results than inconsistent, piecemeal funding in stabilizing tribal waste management situations. An efficient, reliable source of funding could lead to	Each federal agency should develop a national policy outlining what resources they have to support tribal waste management and what resources they could commit towards a joint federal funding program.			
114	113	5/2/2017	as an inspector in the region, i am hoping the new leadership will let me continue to do my job and to help build our state inspectors' capacity. we (epa/state team) make a difference on the ground . we do real work and identify issues that the facilities need to fix to reduce the release of harmful chemicals into the environment. we are pro-economy and we are pro environment.		training for our states. I have organized three RCRA inspectors trainings for two of the Region 9 states in two years. The state inspectors need to have the tools and knowledge to implement the regulations. I suggest that OECA put more resources in training our state inspectors. Each inspection training (class room and in the field) received positive feedback from our state inspectors. We add tremendous value to the state inspectors' day-to-day work.	Instead of answering the question of untapped opportunities, let me address the existing opportunities that have been taken away due to the change of leadership at epa. as a staff inspector in the region, i was told recently by my management that we should not conduct hazardous waste inspections at large facilities. it happened that my work experience ([**REDACTED B6**]) and my education ([**REDACTED B6**]) led me to this rcra hazardous waste inspection/enforcement position in the region when i use my technical and regulatory skills, especially with respect to inspection/enforcement at large facilities with complex industrial processes. I have seen facilities that spend the		1. We already do a lot of joint inspections with the states, often at their request because the facilities are too challenging for them (e.g. complex industrial processes, specific regulatory exemption and etc). EPA leadership should welcome these opportunities to assist and support our state inspectors because they need this to be effective in their work. I have put in several requests for HQ to provide training support for our states. the feedback that we have received from the states was very positive. 2. have formal work-sharing agreement with the states that has some type of accountability mechanism built in. also

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
115	114	5/2/2017	The process of hiring an exceptional candidate is daunting. Timekeeping in multiple places (webforms, maxiflex, PeoplePlus) is nearly ludicrous. Taking training in Skillport, the Inspector Wiki and TMS is beyond. We need a simple one-stop shop for training. We need a simple one-stop shop for timekeeping.	Often communities, like governments, operate in silos. An effective means to achieve better outcomes is to have an EPA employee establish relationship with all the environmental players (NGOs, governments, grassroot organizations) in a community and then convene all the players to tackle the issues the community has identified. By removing silos, communities are able to operate more effectively. EPA brings technical experience, know how and acts as a consultant to the locals.	EPA should have marketing goals. Just like in the real world, we should have to hunt for partners and sales. This works for enforcement (each inspector aims for 3 cases a quarter), permits (each permit reviewer reviews at least 10 permits a quarter), and many other programs (EnergyStar should recruit at least X partners per quarter). The goals should be stretch goals.	Certain sections out perform similar sections. The manager from a high performing group should be detailed to underperforming groups to try and fix the issues. Managers who don't address poor performers or cannot get a section to perform at a high level in 2-3 years should be moved out. We need to utilize a "center of excellence" model for more programs. A smaller group with high knowledge can cover the nation, vs individuals in every region with half an FTE dedicated to the work.	We should put all our work on a GIS platform, not just enforcement (ECHO) or facility data (My Environment). If EPA put all its work into a geographic platform (tracking relationships, outputs, inputs, health), we and the puclic could see all the positive impacts of EPA's work. Internally, we'd also know who to else from EPA is working in the same area and could better coordinate.	By working w/ other feds (DOE, Dept of Ag, HUD) in communities, we can better deliver services and remove a lot of red tape for communities.
116	115	5/2/2017	We do not have a mechanism for efficiently cataloguing, retrieving and storing records, and we don't have permission to get rid of paper documents in all cases because we don't have approved electronic systems. I don't know how to address it myself, it is a complex problem with validating electronic signatures in compliance with CROMERR as just one obstacle.	Maintain or increase grant funding to states, islands, tribes, local governmental environmental agencies and NGOs, so that they can keep inspectors, database administrators, and other front-line environmental protection staff implementing their laws and federal laws.	Share more data with the public. For example, we don't have one systematic way to post FOIAble permits or signed enforcement actions to a public-facing website. Different programs and regions have different levels of public access to data. Part of this is a result of too little investment in IT FTE and too heavy of a reliance on IT contractors, which I will address in item 4.	Bring IT contractors in house so that they are obligated to be responsive to the taxpayer and the agency instead of their corporate supervisor. When inefficiency is in the contractor's best interest what would incentivize them to build a smart stable data system?	A single platform for conveying signature chain items that can accommodate any number of signatories and then stores the final signed copy as the copy of record would be a big step forward. Numerous programs are developing such workflows now through SharePoint and other user interfaces with no connection to other data sets that may or may not be related. And many times the electronic signed copy has to be printed to satisfy record requirements for wet ink signature.	Centralize enforcement data but distribute enforcement personnel back to the statutory program offices in regions where they are separate, so that individual inspectors develop and maintain understanding of why compliance is monitored, and assist the regulated community to understand its compliance obligations. Maintain centralized enforcement reporting data from regions to ICIS and ECHO so that cross-programmatic compliance problems in a given geographic region can be mapped with vulnerable communities or resources, such as drinking water supplies.

AMERICAN OVERSIGHT

	I
115	Using the tools from the communities training by the Partnership for Public Service is a best practice.
116	(1) Form data that can be collected via the internet should be collected via the internet, but for some communities a paper option should always exist, such as with the RCRA very small generator community. (2) Since most IT development is outsourced and so many programs have less than an FTE managing those contractors, there is little to no incentive to look for opportunities to centralize data pipelines if that takes time away from getting their primary data objectives met. (3) since so few people in OEI come from programs, they can't recognize redundancy when they see it, and even then, they might choose not to see it because it interferes with all of their competing priorities like

117	116	5/2/2017	We have been curtailed from using browsers other than internet explorer and many of our partner agency web sites are built to be used in Chrome, etc. We have also been curtailed from using file sharing technology with our partner agencies, this prevents us from fully working with partners using platforms like Google Docs, etc. It would be wonderful to have the use of the most appropriate web browser/document sharing to get our jobs done and not spend endless hours trying to justify the use of these technologies.	We already work very closely with our partner states, tribes and local government as well as other environmental agencies. Please allow us to continue to do this work and provide technical assistance to our many partners, the work we do at the federal level allows for the facilitation of many groups that would not otherwise communicate. (Example, states do not have authority to speak directly to tribes, we provide that mechanism. Another example is when we work in tandem with other federal agencies like USDA to provide technical support for complex issues in state, tribal and local jurisdiction)	Allow us to continue to partner, provide technical assistance and provide convening support for our partners.	YES! Please hire in-house tech support, contracted support can only get us so far, then we spend a ton of money trying to keep things going, if we had the support in-house we could make updates, develop better databases, make our products and report systems talk to each other and provide a way for us to get out of this endless loop of buy a system, pay to make changes, dump the system when it stops being maintained then buy a new system; all the while paying enormous fees just to keep the system functional.	Invest in in-house tech support, open up the opportunity to use the best available tech for work.	This has been done to a fault already! All of our support for HR was centralized and funding for training new managers has been cut to the extent that managers struggle to find other ways to get trained. Meanwhile, all the knowledge about how to manage has been centralized to HR and there isn???t anyone local to turn to when an issue arises.
118	117	5/2/2017	Too much HQ input on Regional decisions.	We can do the science, roll out for example cleanup levels based on that, and require national consistency. also provide states, tribes and local communities with funds to build capacity (i.e., tribal GAP funds). the issue to remember though is air and water don't recognize state or reservation boundaries. which is why national standards are important.	more transparency and stop deleting science from the website.	to the extent that there will be cuts in personnel, I believe they should come from HQ which is top heavy and have a lot of staff GS-14s.	again, provide real science online.	could listen more to what the local problems are and bend our goals to those, versus asking states/tribes to meet our objectives.
119	118	5/2/2017	EPA should hire and train internal agency personnel to perform work currently being outsourced to contractors.	Increase the amount of grant funding to states, tribes, and local communities to address environmental concerns and issues.	Hire additional EPA personnel to forge stronger relationships with our partners. EPA personnel are stretched too thin and this makes it difficult to provide high quality customer service.			

AMERICAN OVERSIGHT

	I
117	1) Develop online (cloud) records platform to make staff-level filing easier and more efficient, hire local records specialists to help provide support to new employees (and old) who need help maintaining their records. (The Air Force did a good job when digitizing records in providing training and support for staff through the transition) Use of digitized records that are kept in a standard way would free staff to do their jobs rather than spending hours on end when researching a FOIA 2) Develop training for all systems, have local training experts to help staff navigate new training/technologies, these training experts could look a lot like training mangers in the Air Force.

120	119	5/2/2017	Contracts are unacceptably slow to get signed - even moderate-sized contract cant take over a year to get negotiated and started.		Moving to making more of our data on chemicals (properties, safety, toxicity) online in an easy to find place. ORD is developing a series of dashboards showing how this can be done. This lets state risk assessors, companies, and other stakeholders get easy access to the data EPA has generated and compiled.		The IT world has moved beyond what most of the offices at EPA are doing, and one cause is that it is hard to hire IT professionals here because of bureaucratic rules. Instead, we pay contractors a significant premium, but often don't even have in-house federal expertise to make sure that IT / software work is done as well as it should be.	
121	120	5/2/2017	Processing electronic discovery and FOIA responses is overly time consuming because we have electronic systems that are not easily searchable. Even FOIA online is not easy to search without knowing specific FOIA number. Some FOIAs are duplicative and if we could send requesters to FOIA online it would be less time consuming but the requestors have a hard time searching w/in FOIA online. Improve our overall IT abilities.					
122	121	5/2/2017	Given modern IT resources, there is no reason why, in this day and age, that people plus timecards can't be entered and run after the end of the pay period. This would minimize corrections by staff, supervisors, and managers after the close of the pay period, who essentially must review PPL+ 2x each payperiod.				OCR and machine-learning technologies to recognize and process handwritten postcards, comments, etc. This is is well-solved problem. Response to comments analyses on regulatory processes could be partially automated by some of the techniques adopted by scientific systematic review experts and internet textual analyses (such as spam filtering) including natural language processing and machine-learning. See, for example, https://gdsdata.blog.gov.uk/2016/12/20/using-machine-learning-to-classify-user-comments-on-gov-uk/. Especially for regulations triggering thousands of comments, across the entire government, this would have	A number of government agencies share responsibility for managing and researching different parts of the chemical environment - FDA for food, drugs, and cosmetics, EPA/OCSPP/OPP for pesticides, NTP for generating complex studies on substances of interest. These agencies collect data, but often don't share AND when they do the data is parsed into each agency's unique format requiring other government stakeholders to reanalyze the data. If the agencies developed internal confidential data

131	130	5/3/2017	The fact that Headquarters staff and senior management are afraid to make decisions, I feel that the majority of HQ staff can be deleted and the work handled by those who deal directly with the people of the Untied States. Let the Regions do their work without HQ. There are too many delays and too many meetings before the work actually gets done.	the Regions work quite well with the states they represent. Let them do their jobs without HQ involvement.	the Regions do quite well providing service to the states and the public. Waiting for HQ to actually make decisions or provide real directives that matter are hindering the Regions from moving forward. I mean really, how long does it take to finalize a lead policy?? The regions have been waiting since 2012. Make a decision and move on.	Yes. Hold managers accountable. The rank-and-file staff are inhibited from doing their jobs by senior managers. That's what happened and Flint and it happens all over the place, its just not reported. The ego of managers has inhibited the real workers from doing their jobs. Install a 360 degree review where staff reviews their supervisors. When issues are noted with managers, they should be dealt with instead of sweeping them under the table. Management tends to "circle-the-wagons around bad managers to protect them instead of training, penalizing, or removing them.	For my position, yes! We have been waiting years for the implementation of a new blood lead model called the all-ages lead model. However, since management in HQ is afraid to make any real decisions or to finalize anything...we are still waiting. Did I mention that the CDC lowered the recommended blood lead level 5 years ago and we still have not responded to it.	Put more faith in the Regional staff. We are the ones who work hand-in-hand with the states, tribes, and other federal agencies where it really matters. Want to make the agency a better place. Take a look at what is happening, or not, in HQ and how its effects the staff and the work being done in the regions. We are way too top heavy.
132	131	5/3/2017	I believe and know that all Secretaries (Administrative Assistants) are way over due to be upgraded with all the work and responsibilities placed upon them this needs to be corrected ASAP. All of the other employees GS-10, 11 and above worried about their high 3's what about the assistants high 3's they make much less than the rest of the employees and work twice as hard. They should not be required to have a desk audit performed the agency knows exactly what they do.	Hire more dedicated and responsible employees in the state agencies some of them just don't care with all of the grant $ they receive from the Federal Government I know they can do a better job.	The state agencies need to hire more dedicated and pleasant individuals.	Having more Video Teleconferencing Meetings/Conferences (VTC) instead of having so many employees traveling and also have trust in the employees that have been performing the duties and have the experience not bringing over other employees from the same region out of state to perform these duties and spend unneeded travel monies.	(VTC) conference calls	Hiring responsible dedicated employees to perform these duties/tasks and the most important is the follow up to make sure this important work is being performed.

134	133	5/3/2017	In 2014 the agency migrated to a shared service provider for human resources, payroll and time and labor services. The OCFO organization signed a document stating they would move time and labor in a year (there were issues with a complicated account code structure). This never happened. We're four years into the migration and they're still running their internal time and labor system. This is unnecessary inefficient work that is costly to the agency. Millions are spent on the interface and the resources. It affects every organization that reports time in their system.	N/A	It would save tax dollars.	Yes. The time and labor system should be migrated with the HR/payroll system. The result could save the agency millions.		Approximately 10 years ago, under Luis Luna, the agency created three human resource shared service centers (RTP, Cincinnati and Las Vegas). We had an HR office in all ten regional offices. The headquarters HR operations unit moved its residual HR employees appropriately; their organizations were dissolved. The 10 regional offices kept the HR functions, including the employees. At least one regional HR office has 13 HR specialists functioning as a "shadow" organization. Also, the HR offices kept their HR directors (replaced them when they left), which is a
135	134	5/3/2017	The process to place a contract or a request for a piece of laboratory equipment is overly complex, the rules and requirements are not clear to the individuals initiating the action, there seems to be little interaction between the individuals working on a particular action, and the requirements seem to change depending on who in the contracts office is handling the action. We are placing small contracts ($25-60K) that take many hours of staff time because the rules and requirements seem to change on a daily basis. It would be nice to have a clear list of documents that are necessary to initiate either a contract action or an equipment purchase that are clear and concise and that are agreed upon by the contracting officials. Once an action is placed it would be valuable for the contracting officer to set up a meeting with the individual who initiated the action to discuss the action, determine if the documentation is complete, and then to provide a schedule for the contracts office to stick to when processing the

136	135	5/3/2017	There is too much redundancy across offices. Many of the administrative functions could be centralized in the immediate office or an office w/I the AA-ship. For example in OW, we are testing centralizing our FOIA functions and our HR - operational functions. The HR Service centers still require real signatures, electronic would suffice to reduce time and paper. Many of our processes have bureaucratic steps that managers are stuck with that mind set - remove SES and GS managers with mindsets that avoid technology advances. Have only one HR Service Center - they act independently, and there is no accountability.	Balance. We can achieve good environmental results, while creating job and economic growth. Employees need to feel valued, and to have an open mind. The newly hired staff don't have any business/economic learning with their degrees, so they don't come to the table with a balanced perspective.	Listening. Listen to what they say and go back to the office to see what is feasible.	It s everywhere. You have to change the SES core. The political appointees are only there for x- yrs, while the SES-ers are career. They can outwait the appointees and little change happens, often times it is silenced.	There is still too much redundancy in our IT systems. For example, OCFO - they went to IBC for payroll, yet we have a separate system People Plus, and a separate Property System - SunFlower when the IBC system could handle it all more effectively. There was even azan opportunity to use the property system in IBC, but the office had a different objective. If they were integrated, auditing would be easier and accountability would exist.	Instead of stove piping (vertical) program offices i.e., water, air, waste, etc... look for opportunities to (horizontal) integrate the medias for greater efficiencies.
137	136	5/3/2017	Confusing in transitions between administrations; no clear messaging.	Be the backstop most States need in meeting environmental expectations. Implement the regulations as written to all parties.	really depends on the active definition of customer service - if it is treat everyone professionally and equitability then a good to excellent service is being delivered now; if the definition is how can EPA guide everyone thru the expectations of each environmental regulation as if their consultant then many more staff would be needed at State & federal level.	Offices outside of high cost areas.		I see little federal overlap - there is an opportunity to (re)define the core expectation and each agency's roles in successful completion. As far as the State/EPA role, there is some overlap but often requested at the non-political level for support.
138	137	5/3/2017	I think that sending all promotion/reassignment actions to PSB, proves to be costly and cumbersome. If the employee's risk level is not changing from their previous position, and they have cleared PSB within the last 7 years, it may be unnecessary to send them again.	The EPA has made huge strides in air and water quality since the agency began. It is horrifying to think of all the setbacks and harmful effects on the environment if all of the current restrictions are repealed.	Continued support and availability. We can not accomplish this if our scientists are not allowed to continue with their research and work.	The agency as a whole, should be more strict with the grades given to non-supervisory, non-scientific staff. Non-supervisory GS-15 admin positions should not be common practice.	True E sign for documents. The DOD uses it, and it would stop all of the unecessary scanning and printing.	

AMERICAN OVERSIGHT

	I
136	Yes, When I was in the private sector, they had a HR system that controlled everything - access, training, accounts, equipment, so when you left the company "one switch was checked" and everything in your account was closed out. Here you have a "separation checklist" that you have to walk thru to the wrong locations - tedious and time consuming
137

139	138	5/3/2017		Stronger enforcement is needed to achieve better environmental results when it comes to pesticides (enforcement is typically conducted by states and EPA regional offices). There is no point in reviewing the risk of pesticides and mitigating that risk through pesticide labels if the use of a pesticide based on the label is not enforced. This will also help keep a level playing field for the private sector instead of rewarding companies that are not good stewards of their product. The government also needs to do a better job of promoting the importance of science. Strengthen science education in schools, provide science programs for adults etc. People do not have a strong enough background in science and therefore do not trust it. By not trusting science, people are scared of technology (developed			OCSPP-OPP-RD needs to have one file system where anyone can look at files and/or notes that pertain to a pesticide application package. This is especially important when someone is out and others need to fill in. Furthermore, OCSPP-OPP should be on one filing system where everyone in OPP has access to all aspects of the system. The system should include up to date information on all active ingredients (current use rates, products, mitigation, risk assessments etc.) and on all end use products (current and previously accepted labels, CSFs, data matrices, data reviews etc.). This information is currently kept in piece meal across a dozen applications, databases, etc. Old files of products are	
140	139	5/3/2017	The largest hurdle to making greater progress at my job is that any document signed by the Division Director must be reviewed by ORC first. Lawyers, like project managers come in all different levels of abilities and experience but all but the best take weeks to review the documents and continue to revise for little purpose other than to have input.	This is a tough one. States pay their employees less; have tremendous turnover; and generally lack talent and experience. As far as the private sector - you can't choose the experience of the environmental manager of the facility but it would be great if we could have input into the consultants that industry hired. We work with completely incompetent environmental consultants that cause progress to halt as they require constant and overwhelming oversight.	We have a job to do but we don't have to treat everyone else like the enemy. I view the regulated community as my customers and while they don't always like my advice my goal is to aid them in getting through our program efficiently and cost effectively, which I typically understand better.	Promote managers by competence rather than diversity. Figure out how to fire incompetent or unproductive employees.		Partnering takes a long time. Regulators work at their own pace and generally are fearful of making decisions.

141	140	5/3/2017		All site remediation projects should include EPA staff with expertise in analytical chemistry, field sampling and risk assessment. The agency has lost the majority of its staff with expertise in these areas and now many decisions are being made by contractors who don't consider cost as a priority.	In order to improve relationships with our partners, senior management must set the example. Senior management along with staff, must be involved in improving the partnership with states, tribes and local communities.	The 10 Regions and HQ implement policies pertaining to grade levels, PARS and performance / conduct issues differently from each other. For example, the basic grade levels in HQ is GS13, 14 &15 while in the Regions its GS12 & 13. There is too much grade inflation in HQ. Due to union overreach, managers have become facilitators & mentors instead of managers\ facilitators\ mentors . Holding all employees to a higher standard can only be accomplished if poor performance and conduct can be addressed by management. To help improve the process, boards can be formed to review conduct and performance problems identified by	The agency has done a good job purchasing current technology and investing in lean development, but the technology is only as good as its implementation. In order to significantly improve efficiency, the agency needs hire people that incorporate our business model into the technology. For example, purchasing SharePoint is a great investment, but the agency did not supplement that investment in technology with adequate that could develop the tools to make it truly useful and productive.	
142	141	5/3/2017	The current state of our agency is stifled. The work that we do, as EPA employees (environmentalist), is being ruined by our Administrator and his chosen staff. We have regulations that are in place and it's our job to ensure they are being used, properly. We are all here to do the right thing - we support our mission - to protect human health and the environment! Let us do that and that will improve the organizational process and enable us to do our job effectively. Stop trying to get rid of useful regulations.	Regional offices ALWAYS work with our states. It's our job to help them, teach them, oversee them, and ensure we're reaching a common goal. The states CAN'T handle the burden that our Administrator and President are hoping to hand to them. They can barely get the work done we give to them now, which isn't due to our "overreach" it's actually due to their lack of budgetary funding. We are talking with our state counterparts multiple times a day - this is not new and we do not expect this to change.	Increase our funding and this will enable us to serve our regulated, public sector better! Stop telling us that the work we does doesn't matter. Stop telling us that the we need to continue to do so much more (because you're actually stressing our states out!) with less. Stop saying science isn't real! Facts are facts and EPA has made a huge difference throughout our many years REGULATING industry and pushing technology and creating jobs and innovation.	All of our administrative systems are more complex then they need to be - i.e. people plus, concur, etc. Allow the Regional offices to make their own decisions and stop micromanaging us - this will reduce costs and inefficiencies A LOT! Allow us to hire computer, IT staff that are effective and will reduce down time.		Someone needs to be the watchdog. We give our states a lot of money to run their programs. It's our job to be sure they are running them correctly. In a lot of cases they are, but there are a lot of cases where they are not - they don't have the staff, they don't have the expertise - they need us, our expertise, our oversight.

AMERICAN OVERSIGHT

	I
141	They embrace and incorporate technology (software developers, hardware, database administrators, etc) into to their work. The agency has very small IT groups that can only provide the most basic support. It does not invest in the staff that is needed to make the tools available useful.
142	Strategic Planning - our office has taken a in-depth look at what our small office within the division does on a daily basis. We've invested time in this to take a look at how we can standardize processes, improve processes, improve our oversight of our states' program. We've done this with the intent of making things better. We've done this to ensure each person is on the same page. We've done this exercise to see how we can best meet our personal/regional/national goals. The people who do the actual work and the people that know how to fix things (hopefully hence your survey) and they will have the best ideas. The other thing is true buy-in. We had facilitated meetings

143	142	5/3/2017	Too many layers of management. Hard to move projects forward in a timely manner.	I work in a support position so will leave this to the "boots on the ground" folks.		Change regions to field offices so they work with HQ not as a stand alone entity. When you go to a region you often hear "We do not do it that way here!" I thought this was an agency effort. Also, why do the Unions have so much power? They bad mouth the supervisors and bully their way through with threats while prancing around like they own the agency. Ridiculous behavior for adults.	We should be using the systems we have in place. Staff are resistant to use SharePoint and One Drive. We still place memos in folders and route them from level to level. They come back down for minor changes that could be easily managed along the way. Instead they go back and forth and we are wasting time and resources instead of staying within established timelines.	Partner with agencies on tasks that are similar same so we do not keep recreating and wasting resources. Contracting, training, and other like activities can be improved and employees would have consistent processes to follow. We are all addressing the same skill sets, processes, etc. Combine and conquer.
144	143	5/3/2017	Term employees need to see security in their jobs. Without the hope of being turned to permanent employees or without receiving training opportunities that make them eligible candidates for other permanent jobs, they will leave the first chance they get. Not all terms are the same and their eligibility needs to be understood by all. Equal pay for equal work and equal promise of security for the same jobs. 151	150	5/3/2017	Extend the range of "local travel" beyond the maximum 100-miles roundtrip so that I can get out to "nearby" sites quickly without having to wait for multiple approval signatures.			Allow regions to directly purchase equipment for work at Superfund sites. I recently convinced Region 3 to do just this. Region 3 spent just over $50,000 for equipment I recommended they purchase for application at a Superfund site where I was tapped to design and implement a site remedial investigation. The result of making this purchase probably saved the region several hundred thousand dollars, while providing the region with approximately one million data points for analysis, which could not have been accomplished without the equipment purchase.	Greater emphasis and pursuit of passive sampling technologies for water sampling. Passive sampling is much less expensive than traditional methods, are quantitative, and can be very effective.	If we are to work with other federal agencies (e.g., U.S. Geological Survey, Army Corps of Engineers) we should be able to mandate that they actually do the work tasked to them. Too often, these agencies agree to work on a regional site project (e.g., Superfund site), take EPA's money, and then go their own way. Other federal agencies are also much more expensive than is justifiable.
152	151	5/3/2017	The greatest inefficiencies that I experience are (1) the lack of a budget at the start of the fiscal year, which originates with Congressional ineffectiveness primarily due to obstructionism in Congress and (2) the inability of our Contracts Office in RTP POD to route contract materials and issue contract in a timely manner.	We currently work on a daily basis with state, tribal, and local air agencies to support them in meeting their data needs required to implement the NAAQS. E-Enterprise is a program that is ideally positioned to further improve those connections. We have been seeking for 2 years to get the resources needed to streamline environmental reporting for the private sector through E-Enterprise. Unfortunately, Congress struck that item from the President's budget proposal and thus our program office has been trying to fund it bit by bit. Our savings to industry are in the millions of dollars per year as documented by a Return on Investment analysis completed 2 years ago, but we can't get the resources to implement our programs even though Industry is very supportive of our efforts.	The state, tribal, and local air agencies rely on OAQPS for helping them collect and develop data and tools that is crucial to environmental decision making (emissions data, ambient air quality monitoring, and modeling tools). Unfortunately since the Obama Administration has combated Congress for the past 8 years, we've gotten more requests from partner agencies to better support their data needs than we can support. We do a large portion of our work in house already, but there are so many different data needs that we simply cannot do everything needed without sufficient contractor support. Thus the single largest thing that could be done would be to improve funding for the infrastructure that we create to support state, local, and tribal source data and tool development needs. It is far more efficient for EPA to create tools in collaboration with state, local, and tribal agencies rather than each agency develop different tools	Absolutely. Numerous examples of this have been identified already by the E-Enterprise program. Take a look at what we've already done in this area and support it so it can thrive and make the improvements that have already been identified via close collaboration among EPA and partner agencies, with direct and frequent input from industry stakeholders.	The Office of Environmental Information is developing tools using a very inefficient approach in working with contractors. New technologies for "model-based design" exist, and our own EPA studies by the Office of E-Enterprise strongly suggest there are great efficiencies in development of environmental data reporting tools that could be gained by OEI investing in model-based design tools	ORD's role is crucial at supporting areas of shared responsibility and mutual interest with other federal agencies and states. However, ORD's culture is one that values research that results in publications over research that is central to EPA's mission and needs for data. Thus, ORD activities should be realigned to ensure support of core program needs for data, with the publication value secondary to the public need and programmatic value.

153	152	5/3/2017	Have an Administrator that is actually interested in protecting the environment, not one who is hostile to the agency they manage.					
154	153	5/3/2017	PAPs before PIPs for performance actions are unnecessary and overly burdensome on managers and the Agency. PAPs are not required by law, we should renegotiate with the unions to eliminate them. We should also get rid of the min sat rating. Employees should not be able stay in the EPA forever with a performance rating below fully successful. Again, this should be negotiated with the unions.					
155	154	5/3/2017	Every new demand from OMB, every new Congressional inquiry or legislation related to project management places more and more demands for additional tasks on the Project/Program Managers. For example, implementing agile sounds great, but we are still functioning under waterfall demands for documentation, design, and reviews and approvals. We need a person or group who has the time to interview across the Agency and with other agencies and private industry to better understand how the role of project/program manager can be more efficiently executed.			As we continue to move toward using the cloud for all kinds of SaaS, PaaS, etc., do we really need the full complex in RTP called the National Computing Center?	Many agencies have a Project/Program Management Office (PMO) that helps facilitate project management, helps prioritize projects, etc. EPA has had a PMO, but it's efforts have been limited to just OEI systems and/or processing OMB demands (CPIC, etc.) rather than really focusing on business needs, and streamlining project management across the agency. Perhaps it is time for an EPA-wide PMO that really helps project/program managers by reducing redundant data calls, clarifying and streamlining processes, and making the information needed more readily available. Customer focus for PMs would also help.

	A	B	C	D	E	F	G	H
156	155	5/3/2017	When we want to take a vehicle home in order to make travel more efficient that saves the agency travel funds and time, the Section chief or Branch chief should be able to approve that request. Currently in Region 6 that has to be approved by the Assistant Regional Administrator. Very inefficient.	The current policies at Region 6 toward enforcement at tribal facilities needs to change. We have a few tribes that continually neglect or ignore regulatory requirements, but we are not allowed to take enforcement actions. For those tribes that continue to show disregard toward the legal requirements, EPA region 6 should be allowed to utilize it enforcement powers, to protect the environment.	Provide for staff to be able to travel more-currently travel funds are extremely limited.			
157	156	5/3/2017	I believe my organization and those that affect my job are very efficient. We have a hard time even coming up with areas for a LEAN action.			The Office of Acquisition Management (OAM) needs more staff; they cannot support the agencies needs in a reasonable time because they do not have the man-power to handle the volume in accordance with acquisition regulations.		
158	157	5/3/2017	It's a small, very small, part of my job, but it is burdensome that there is not an "edit" feature to leave requests. Once a request is submitted it cannot be modified. Any modifications require the employee to email their supervisor, as them to "return" the request (or decline it - I can't remember which) and then a new request must be submitted. Leave requests, particularly those for sick leave related to medical appointments frequently must be modified. I think my dentist appointment will take 2 hours so I request that amount of time off, but then the dentist was running late and it takes 2.5.....modifying this leave request after the appointment takes another 20 minutes of supervisor and manager time. The supervisor always "approves" the time card and it must match leave final leave requests, so it doesn't make any sense why the employee can not modify their requests prior to the close-out of the pay period. Related to People Plus, the Office of Policy has stripped the responsibilities related to People Plus questions, issues, changes from a very,	Local govt and private entities need incentives to make environmental improvements. Regulations are one tool, voluntary programs and market-based incentives are another (typically less effective) tool. If we are eliminating regulations then that tool needs to be replaced with something else if we are going to maintain environmental quality (or continue to improve it). I would suggest thinking about what the alternatives to regulation will be - there are certainly parts of EPA that have expertise in this area and would be happy to help. Also, a common complaint is the "stovepipe" nature of EPA's structure. We are organized around statutes, and therefore opportunities to collaborate across media, particularly when it comes to regulatory actions, are sometimes difficult to bring to	More and more EPA connects with external stakeholders using digital tools, like webinars, social media, website, twitter. I suggest we continue using these tools.	This isn't really a direct response to the question, but I am running out of time and need to turn to other work. I appreciate the survey. Another idea is to create an anonymous "suggestion box" so staff can provide input on an on-going basis. Many of us are eager to work with the new Administration and provide input, expertise, assistance, in achieving EPA's mission of protecting human health and the environment with the goals set by the new Administration. But, we need to talk and meet and learn. I suggest the new Administration meet staff, talk to us, listen to our ideas, let's get to know each other.		

AMERICAN OVERSIGHT

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
159	158	5/3/2017	The People Plus system is not user friendly. It should have basic entries like "Enter my time" instead of "Self-Service." And the leave options are just as strange and should be so much easier to input. Many times it requires staff to help each other figure out how to do it. That's a waste of staff time. The same can be said for the travel, contracts and grants systems.	Allow the States to collaborate more with EPA on issues that they are being charged to implement. Allow us to hold more meetings to bring the States here for form better relationships.	More outreach. Streamline the clearance process for outreach materials. Too many levels of approval before things can even be released. Many times it's too late for the material to even be worth it by the time clearance goes thru.	Less security for high level officials. Use the technology equipment for employee entrances instead of guards who really don't even check the badges. Convert unused spaces for multiple large conference rooms so we don't have to rent out space in the Ronald Reagan Building or hotels for important meetings. If we use science to determine protection for human health, don't try to reverse a regulation based on savings over health. Honor the results of science and the resources spent to derive at the results. Don't make us look incompetent by ignoring our work. How about top officials back their scientists so their scientists can back their top officials?	Upgrade computer systems for employees at more frequent rotations. Why do we even still have databases attached to Lotus Notes?	Many of us are already doing this because we have had limited resources for so long.
160	159	5/3/2017	The only procedural challenges I have observed involve how people respond to funding shortages, behaviors where people try to "get ahead" by tearing down/creating unnecessary problems for reasonable people. I would continue to reward people with helpful, understanding, well-intentioned attitudes, enable these people to reach the goals in their job description, and allow them the mobility to move into groups/projects with people who have similar attitudes.	I do not have any specific ideas, but communication with local populations is important because they will have a better understanding of the area (e.g., how a contaminated site was used in the past, unreported problems, etc.).	I do not have any specific ideas, but it is important to hire well-intentioned people who want to listen, understand and reach goals in a constructive manner.	Not currently.	I think that lessening our dependency on technology can make us less vulnerable to hackers in some circumstances (e.g., maintaining hard copy records, having "Internet-free" computers available for running computer models or maintaining records). That being said, I am not familiar with any new technologies not currently in use.	I think that each agency should focus on aspects of shared responsibility/mutual interest that pertain to their overall goals, and perhaps engage collaboratively with other agencies if helpful, productive relationships can be formed.

AMERICAN OVERSIGHT

	I
159	Other Agencies have 100% flexiplace options for their employees. This saves the environment (air pollution from exhaust) and cuts down on leave time. Since many tasks are performed using the computer working from home is often more efficient. This will also increase morale among the employees. Teach your managers to communicate more with us so we don't have to learn about what's happening in our own agency by reading about it in the newspaper or on TV first.
160	Not currently.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
161	160	5/3/2017	Want an administrator, and an assistant administrator, who actually believes in environmental protection even though it may cost business/industry money. History shows that business will always make decisions that are favorable to their bottom line. Not the "greater good".		Hard to provide excellent customer service when your senior management's task is to "shut you down" and not appreciate the work that goes on in this agency. This administration, and work environment, is demoralizing.			
162	161	5/3/2017					The NPDES Electronic Reporting Rule has already saved considerable labor costs, while improving data quality and making that data available to the public. This could be expanded to other statutory areas. https://www.epa.gov/compliance/npdes-ereporting	
163	162	5/3/2017	There are an absurd amount of meetings held, many of which accomplish little to nothing. Management seems to want consensus in making decisions, instead of just moving forward with the information at hand. We waste a lot of time and effort with the federal and contracted workforce because we are waiting on a single person to make a decision or have a meeting to discuss it with them.	I work in IT, so I don't have many much direct interaction with environmental issues.	I have none. Sorry.	I work in IT, so I don't have many much direct interaction with environmental issues.	When I worked for a previous agency, we used WebTA to input our time and attendance. I was shocked to see that the EPA actually has its own system and it does not work very well. Leave balances in People Plus are never correct and I have been told to just use Employee Express to get my "correct" balance which was the system I used at my old job. It seems a lot of money and effort are being wasted on having our own system.	We have a very nice and modern data center in Durham, NC, that we should offer out as an alternate processing site to other agencies. It would bring money to the agency. I have seen this done in other agencies with facilities that are not as good.

AMERICAN OVERSIGHT

	I
161	Truly value your workers. Once you downsize and loose institutional knowledge with no ability to replace it, you sabotage your organization. Then it can't perform because it doesn't have the physical resources or brain power to succeed. Next comes blaming the organization for not performing, which you have insured. This is a sad situation for the American people who expect EPA to safeguard their environment.
162	EPA and many state agencies have embraced Lean, a program to analyze an area of work and eliminate overhead and excessive process. http://www.leanprocess.net/what-is-lean-six-sigma/
163	The operations at the data center seem to be very in line with the industry standard, are security focused, and organized. We should market that to the government and bring in business.

AMERICAN OVERSIGHT

164	163	5/3/2017				I work in the lab and when the lab needs new instrumentation, we are forced to buy instrument which does not work due to the price bid by the companies. Somehow, we have stop this and the decision which instrument to buy has to be left to the people working in the lab.		
165	164	5/3/2017				Administrative responsibilities could be centralized within each region. Some offices have too many and some offices don't have enough administrative support for staff. Centralizing administrative support would reduce the cost by reducing the number of support needed, and at the same time make support available for staff that may not have had it before. Travel authorization and voucher preparation should be centralized. This would allow staff to become an expert with the federal travel rules and the process would be consistent. Right now each office has their own way of processing travel authorizations and vouchers and administrative	EPA needs to be able to come up with the ability to process travel authorization requests electronically with management able to approve the travel authorization electronically. The same is needed for processing vouchers. EPA staff are still having to use paper request for travel authorization and vouchers.	Some EPA regions do not have the necessary staff to get the job done. I'm all for centralizing the experts needed to accomplish a task and for consistency sake. As an example. Some regions have inspectors that are very good in specific areas of the EPA regulations, whereas some regions may not have that expert. Regions should be allowed to share that expert in order to get the job done.

AMERICAN OVERSIGHT

	I
164	
165	Allow staff to work at home more than 1-day a week. Management in EPA still do not support staff working at home when the job allows them too. Even though there is a policy that allows staff to work at home, there lots of managers who still believe they cannot manage their staff if they cannot see them in the office. Some federal agencies have staff working at home full-time in order to reduce cost in renting office space, and travel time going back-and-forth to work for the staff.

AMERICAN OVERSIGHT

166	165	5/3/2017		Having started my career with a state agency prior to a long career in the federal government, I know that activities and priorities differ from federal region to region and also differ from state to state. National interests do not necessarily cut across the entire United States. The Regions are the face of the federal agencies in those states overseen by the Regions. I think it's important for the Regions to meet with their states, identify each state's specific priorities and, where possible, the Regions should support state priorities where they are covered by an underlying federal statute, even though the state priority may not be "national priority" and the national priority is non-existent or is a lower priority in a particular state because they have previously addressed the problem. Regional staff live in the Regions they oversee and are best positioned	Having listening sessions with the public and regulated community is the best way to determine what type of customer service is needed. The Regions are the face of EPA. The bigger problem is how to address the issue (including a determination of whether the issue is something the States or EPA have jurisdiction over). This is where cooperative federalism comes in and the Regions need to sit down with their states.	When I started at EPA many years ago, inspectors made their own travel arrangements. We knew the government rates and we knew where we could stay (or, if we chose a motel that charged a higher rate, what we would pay out of pocket). Either way, the cost to the American tax payer was just the cost to stay in a hotel. Twenty-five years later, we still know the government rate and book our own hotel rooms but now, a third party company takes $15 for every transaction ACROSS THE ENTIRE FEDERAL GOVERNMENT which effectively takes millions of dollars provided by hardworking taxpayers to do our jobs and puts this money directly into a private contractor's pockets with no		Having started with a state agency prior to a long career in the federal government, I know that activities and priorities differ from federal region to region and also differ from state to state. National interests do not necessarily cut across the entire United States. The Regions are the face of the federal agencies in those states overseen by the Regions. I think it's important for the Regions to meet with their states, identify the state specific priorities and, where possible, the Regions should support state priorities where they are covered by an underlying federal statute, even though the state priority is not "national priority"
167	166	5/3/2017	I believe we've done a good job streamlining a lot of our procedures over the last few years (through efforts like LEAN). Although there are always room for improvements, they are unique to the work my part of the organization does, and are not the kinds of things that can easily be teased out in a brief survey.	The best ways to achieve better results is to have more face time with our partners. While our state and tribal stakeholders are good about coming in to the Agency to speak with us, the boots on the ground approach is THE most effective way to communicate the Agency's message. Trust-building is a lot easier when there are and in-person communication with the staff doing the work of the Agency. That is what actually builds bridges.	Actually, our organization has a lot of processes in place to do just that - between comment periods on documents and stakeholder meetings. The biggest improvement would be to give more autonomy over communications to the individual parts of the organization (for both transparency and efficiency).	As noted in a previous response, our transparency and efficiency would be bolstered by giving our individual program offices more autonomy over communications regarding projects.	A lot of our IT systems are just terrible, and the fact that we have so many of them makes it even worse. It makes our work very inefficient.	If we want to accomplish more, we will have to work out the logistics in our cooperative agreements and grants. If we want the states to do more, they are not going to be able to achieve it with less resources.

168	167	5/3/2017	My current Branch is short staff, while there is another branch in our department that has twice as many people as we do and continues to hand their work off on us. I hate to say this but perhaps in administrative areas within our organization we need an outside lean six sigma team to audit what goes on to improve our functions. I don't think it would be good to audit the science departments as science as those functions can not be properly six sigma sixed by an outside organization. But perhaps the HR, Finance, etc.. should be looked at from outside eyes.	I think the EPA needs to more vocal in sharing what we do. Also share how we are allowed to do what we do. The public does not understand that all because something is hazardous we can't go right into working on it, and the EPA is not responsible for animals in peoples yards.	We need to educate the public, and be transparent in what we are working on within research. Results should be published after peer review from other scientists or journals.	Encourage those that are able to retire by age and affordability to retire. Especially when they are not as sharp as they used to be.		
169	168	5/3/2017	Some of the required on-line training is very difficult, often is not pertinent to our jobs, and frequently the systems we are working in either freeze or do not record the training actually taken thereby creating difficulties with obtaining the needed certificates. Hence, many times, we have to retake the course or contact the appropriate system personnel. Also, it is not easy finding the appropriate contact person when issues arise. This often takes entirely too much time away from our actual work. All of the required training should be re-looked at to see if it is actually necessary, pertinent to our jobs, etc. There is simply too much required training and administrative issues. The systems that we are working in to take training should work more efficiently and present less problems. Often our data systems are outdated hence, we are often dealing with too many issues that take valuable time away from our work. Frequently, there is not enough communication on projects between	Better outreach and coordination with all of these entities. Being able to have the correct contacts for whatever issues are at hand would be helpful. Perhaps, our Public Affairs Office could obtain this information for staff. It is especially difficult dealing with large State organizations and trying to maneuver through their organizational chart to find the correct individual to speak to.	Providing important information pertaining to new or existing regulations so as a clear understanding is provided. Perhaps, this could be achieved by organized meetings or through sending flyers. Communication and transparency are crucial elements. The public usually contacts EPA when they need information on specific projects.	Better IT support so that data systems work on a more efficient level. Allowing additional opportunities for working from home would also help save overall costs, Maxi Place should be offered to all EPA regions. Consolidation of floors within buildings would be helpful when possible. Buildings should be energy efficient and consider all of the latest technologies (green remediation) which would be helpful to reducing costs and inefficiencies. Research into climate change and further technologies that would improve the environment should continue.	All products within the government should be as energy efficient as possible. Research should be devoted to producing better and more energy efficient products.	Federal agencies often act too independent of one another and should work cooperatively together on all issues including environmental. Too often they are disconnected, having their own internal processes which often slow the progress of projects. There should be also be a better coordination with States as well. We should all have the mutual interest of the environment and be able to work more efficiently/cooperatively together. Perhaps, the upper management of both States, other federal agencies and EPA should work together to achieve the needed cooperation.

AMERICAN OVERSIGHT

	I
168	Continue to go Green with less paper use.
169	Up to date and efficient data systems aligned to what the private sector utilizes which will allow for personnel to be more efficient with actually doing their jobs. Also, the contractors often used by the government are often not as good because we are required to use the "lowest bidders." An inordinate amount of time is often spent on dealing with issues on the contractor's technical reports which are frequently inadequate. The back and forth process in not conducive to being efficient and productive. Also, we should not be required to pay for a contractor report that is inadequate. The contractor should revise inadequate reports at no cost to our agency if it determined that

170	169	5/3/2017	Budget. Please pass and enact the budget in a timely manner. Appoint people to leadership positions that understand the roles and responsibilities of the EPA to the citizens of this country and the world. Leaders who will work to ensure that the EPA carries out it's responsibilities without regard to the agenda of the political parties. We are here to protect the health of people and the environment.	Be consistent. Do not let ideology rule science.	Be consistent. Do not let ideology rule science.	Be consistent. Do not let ideology rule science.		The staff of the EPA work collaboratively with other agencies, the states, the tribes, various organizations and institutions. Consistent funding and protection from the changing political whims of congress and the president would allow us to follow through more efficiently and effectively on our obligations.
171	170	5/3/2017		We should increase grant funding and capacity-building efforts with tribes so that they are better able to independently take on environmental regulatory programs within their jurisdictions. We should provide regulatory consistency for the private sector and ensure that the costs of private sector environmental harms are not externalized and passed on to American citizens but are rather paid for or mitigated by the entity causing them.	We should improve our tribal consultation practices, be transparent about who in the regulated community we consult with and provide equal time to environmental groups as we do to industry, and we should make sure that the comments coming in from the public through phone calls and emails actually get to the administrator in a meaningful way.	I don't. I do, however, see many places where an increase in funding or staffing could measurably improve the quantity or quality or work and the efficiency with which we can complete it. More funds for training, more advancement opportunities for administrative staff, and more funding devoted to the research and technology resources we have available to us would be extremely beneficial.	More widespread availability of mobile devices for employees could increase efficiency. We could even eliminate desk phones and go entirely mobile. Improved quality of telework technologies and support services could increase efficiency. The administrator and his office could adopt some form of public calendar that would show the public what he spends his time doing and who he is meeting with and that would make us more accountable. We could also keep important scientific, policy, and legal information available online for public access rather than removing it. In fact, we should be updating and expanding the information available on our website since it is outdated, difficult to navigate, and does not	We could increase staffing in the regional offices to better facilitate our local-level work with states, tribes, and communities. Our regions are currently so understaffed that it can sometimes take them years to get to non time-sensitive matters but that harms our agency's reputation and undermines the strength of our relationships with these communities. Having more people present at the local level to directly engage with these stakeholders would streamline many regulatory processes and assist the stakeholders in achieving their objectives. We already have excellent working relationships with other

AMERICAN OVERSIGHT

	I
170	Less top down micromanagement. Empower the people actually doing the work. Protect the EPA staff from the political fighting of congress and the whims of the president. We are doing valuable, important work that makes a difference in the everyday lives of people. Let us do our work. Ensure consistency in funding and support so we can perform the work that must be done.
171	Transparency of process, particularly among management and leadership positions. Active diversity and inclusion efforts have been proven to increase efficiency and well-being of staff. Also, having diversity in leadership positions is critical. The people in management that I am most familiar with - those in my own office and those in the administrator's office - are almost exclusively white, straight, Christian, cisgender, and are majority male. This is not a good message to be sending to those people who work at EPA who do not fall into those categories.

AMERICAN OVERSIGHT

172	171	5/3/2017	The OIG has many processes in issuing a report that are not necessary and duplicative. IG is run by lawyers who do not understand auditing and auditing standards. They have required lawyers to review documents, because they only trust lawyers. However, the OIG already had a QA process that checks all facts to supporting documents and working papers. The legal reviews (Legal reviews discussion documents, draft reports and final reports) done is duplicative of the QA review. However, the IG and Deputy will not eliminate these reviews even though staff (Those with accounting degrees), have told them that the auditing standards require internal controls that provide reasonable assurance, not absolute assurance. The IG and Deputy seem to want almost absolute assurance. The result is an inefficient report issuing process. In many cases, the review and issuing of a report can take 4 to 6 months. The audit work itself usually take about that long. Totally inefficient and unnecessary.	Better oversight from Regions. Regions do not perform adequate oversight and do not know what they are getting most of the time.	none	EPA relies on inefficient Cost type and Time & Material contracts. Whey using IDIQ contracts, the agency still issues mostly T&M task orders. The agency should move toward firm fixed priced contracting whenever possible. The agency makes excuses for not using FFP contracts. They believe there are too many unknowns. In most cases, these excuses are not valid and are just that, excuses so they can continue to do what the have always done.	None	none
173	172	5/3/2017	The off-site rule is burdensome for PRPs as implemented. The process takes too long for PRPs to find out that a facility is acceptable/unacceptable for waste disposal. The PRPs are ultimately potentially liable anyways if they dispose of waste at a facility that disposes improperly. The review process either needs to be made faster (<24 hrs) or we just need to publish a list of acceptable facilities that PRPs can be responsible for checking on their own. The implementation of this rule is very inconsistent across superfund anyways. A lot of red tape with little gain IMO.		People need to be more responsive via telephone. If working from AWL location, it should be mandatory that people use EC500 to have their calls forwarded to their phone at their AWL location. Why wouldn't you, unless you are just looking to be unavailable?		Many people still use paper hardcopy mail, when electronic would more than be fine. Save on the paper, and the postage! This goes for submissions from the PRPs too. The standard language in CDs and AOCs requires hardcopy submission of monthly progress reports. I think that is fine to have the hardcopy required since we may once larger documents in hardcopy at some point, but RPMs that do not even look at the hardcopy progress reports should let the PRPs know that electronic is okay until further notice.

174	173	5/3/2017	We spend too much time tracking results and re-inventing the wheel through processes like 'lean' The benefits of 'leaning' are in some cases exaggerated and going through lean creates perceived need to do additional tracking to demonstrate how much better things are afterwards, when really they're not. Let the professionals to their jobs and give them the time and resources they need without a lot of peripheral duties.					
175	174	5/3/2017	The procedure that prevents me from doing my job efficiently is the layers of concurrence that are added to documents. I understand that more than one set of eyes should review documents, especially those sent to the general public. However, eight or more lines of concurrence is excessive.	Funny you should ask my opinion regarding partnering with states, tribes, local communities, and the private sector. If any of those entities were capable of achieving accelerated success, we would not be in business. Due to the number of request we receive from each entity identified, further solidifies the need to expand our efforts to assist with each. Maybe we could do a better job equipping them to handle things at their level. My experience is that many are not interested. Once they call us in, it's like handing a baton from one running to the next. My recommendation would be to host more efficient collaborative sessions with states, tribes, local communities, and the private sector to get their buy in knowing full well this will be fixed in a moments notices. I would guesstimate it would take several years to achieve this level of	Thank you for asking this question. The first problem is, it is difficult to initiate and maintain excellent customer service to entities that don't maintain consistent staff and/or leadership. There tends to be excessive turnover with states, local communities (leadership) etc. There tend to be a number of vacancies for extended periods of time as well. How is ANYONE expected to work with that? My recommendation would be to host regular meetings (monthly, quarterly) with each entity. If no identified representative is available, send a backup or have someone on standby to communicate messages back and forth. Ten or more years will be needed to achieve this level of success as well.	The number one untapped opportunity I see is the number of internal employees that are passed over and not allowed to move up in their career verses the number of employees that are brought in from the outside and move up quickly.	Vimeo, JotForm, Eventbrite, Constant Contact, Google Drive, Dropbox, YouTube. Most importantly a better VPN. STOP using the lowest bidder each and every time. The cheap comes out expensive.	The best way to accomplish more would be to not shut others out. Each and every division has employees with duties that overlap. when one division host training, other personnel in other divisions typically don't know about it or are not invited to participate. The basis job function is similar. The specifics of each job may be completely different but the basics are the same. More than an handful would benefit from this. As it relates to other federal agencies, provide a list of opportunities available at each and advertise broadly. As it relates to the states, the states could benefit from the federal entities

AMERICAN OVERSIGHT

176	175	5/3/2017			institute a FOIA online system: releasable documents should be made available to the public without an official request. The Nuclear regulatory commission does this and even some states including Louisiana and Oklahoma. this will reduce time and effort spent on responding because documents are easily and readily available to the public through the web.	As a front line employee, I am already doing more with less and finding efficiencies. All this talk about finding ways to reduce cost and inefficiencies needs to have a focus. I cannot stand in front of a community and say we are doing all we can with the limited funding we have--you need to be patient and when funding is available we will get to your issue. Performing environmental work cost money and takes time. There is no other way.		We need one environmental response. For example, the EPA and the NRC both address radiological contamination. Why are there two agencies doing the same thing, and with different levels that are considered 'protective'? Why are multiple agencies providing grants to the public for the same goal? For example, the ag agency and EPA provide grants to the public to implement best management practices to protect waterways.
177	176	5/3/2017	Take steps to make the budget process more efficient. It is inefficient to work from CR to CR, and spend resources planning for government shutdowns. Just within U.S. EPA these inefficiencies certainly cost millions of taxpayer dollars. Extend this government wide, and the inefficiencies of the budget process are no doubt costing the taxpayers billions of dollars - a completely unnecessary waste of our country's resources.	In my personal experience, states and water utilities are fully committed to providing safe drinking water and protecting their water resources. However, many states and utilities lack resources to do this effectively. U.S. EPA can form partnerships with the water sector, and provide technical assistance to improve public health protection and preserve the quality of their natural resources. All this can be done without additional regulation. Promote and fund these technical assistance programs.	In my personal experience, states and water utilities are fully committed to providing safe drinking water and protecting their water resources. However, many states and utilities lack resources to do this effectively. U.S. EPA can form partnerships with the water sector, and provide technical assistance to improve public health protection and preserve the quality of their natural resources. All this can be done without additional regulation. Promote and fund these technical assistance programs.	Promote cross-AA and cross-division efforts and programs throughout U.S. EPA. There is some redundancy in effort that could be greatly reduced just through the establishment of cross-organizational workgroups that are focused on a specific program or issue.	U.S. EPA has already made strides to go paperless. Continue this effort such that all records, forms, contract packages, etc. are electronic. Also, work to achieve better IT integration across U.S. EPA by replacing legacy systems that are beyond their useful life or otherwise inefficient (e.g., EAS and Concur).	In my experience, U.S. EPA proactively pursues and engages in collaboration with other federal partners and states. In my own organization, within OGWDW, we have an extensive network of federal, state, association, and community partners that help guide our work.
178	177	5/3/2017	Creating a paper version of an electronic calendar. This information is already available for those that need to see it. Training on how to use an electronic calendar.	States need to be responsible for implementing their own environmental response programs.		There is redundancy in the environmental response area. Special teams doing similar things.		Redundancy in environmental response that could be streamlined.

AMERICAN OVERSIGHT

	I
176	ACCOUNTABILITY. Our management needs a better means of firing those that do not perform. There is much discussion about accountability, yet employees sit around and do minimal work at the same pay, let others do their work, surf the internet shopping and checking personal email, and continue to ride the system without consequence. This would remove the inefficiencies by removing the non-performers. The documentation burden is outrageous and does not invoke a 'do your job and perform or there will be consequences'. All this does is promote a 'movement' or 'reassignment' of the employee because

179	178	5/3/2017		Having more outreach opportunities with states, tribes, local communities, or the private sector would help to increase those entities' understanding of regulatory requirements and pollution prevention methods.			Electronic routing systems, which would reduce paper waste and increase efficiency.	
180	179	5/3/2017	The Trump Presidency and Scott Pruitt as head of the EPA when clear conflicts of interest are present. Impeachment.	Having management that actually believes in achieving better environmental results and is not beholden to any particular special interest groups. Being able to show states, tribes, local communities, and the private sector that we are not beholden to any particular group.	Setting a timeframe for getting back to stakeholders when they contact us and setting up regular meetings to keep them informed, would likely require additional funding however as EPA is already short staffed.	Reaching out to a more diverse set of stakeholders with a wide variety of interests in order to tap them for assistance in procuring grassroots data and circulation of critical information to protect human health and the environment. The key here is a diverse group with all not beholden to any one special interest (on either side).	Higher reliance on collaboration tools like SharePoint.	Not sure what you're getting at with this.
181	180	5/3/2017	Every new administration requires a heightened level of reporting and this new administration is no different. This adds unnecessary work to every project. What is particularly distressing, however, is the assumption that EPA was fundamentally broken and we need to provide evidence to substantiate that claim-so every written product now has to show how much better we are and that everything we did in the past was wrong. Quite frankly that is a waste of time.	This question seems to imply that EPA has not been effective at partnering with states, tribes, local communities or the private sector and I question that premise. In my experience I have seen first hand a lot of partnering with these entities. The answer I believe this question is seeking is to say that every time EPA and a state disagree on a particular issue that EPA should back off and defer to the state regardless of the scientific basis for EPA's position. Such an approach is misguided.	Treatment of each of these partners as equals-each of these constituencies have a legitimate point of view and valuable knowledge to contribute. So if the new administration's plan is to listen primarily to the regulated community and consider input from local communities only when absolutely necessary, then that would not be fair to the American public.	The primary untapped opportunities are with the statutory framework under which EPA has to operate. While the major environmental statutes have produced great results for the benefit of the American public, there are opportunities to improve each of those statutes which are well known. EPA should work with Congress to help fine tune these statutes.	Improved air monitoring techniques that could better define areas of potential impact, including selective use of technologies such as drones to monitor pollution plumes.	Coordinate with OSHA to target facilities with either a history of violations or which present a high potential for harm to either workers or the surrounding communities and conduct joint inspections.

179	
180	Streamlining more generic tasks we do in the office and have been doing for some time. Creating more agreed upon boilerplate language for such tasks to allow for time to focus on more pressing and time consuming issues.
181	The only cautionary comment I would offer in this regard is that while each of these goals is truly worthwhile, do not lose sight that we should not only consider the cost side of the equation, but also the benefit side of what the Agency does. It seems like the current administration's intent is not to engage in a true cost benefit analysis, but solely in a cost analysis.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
182	181	5/3/2017	There are two major processes at EPA that are broken: hiring and buying. I won't go into detail, but it takes 6-12 months to hire someone, even when promoting from within. This makes it impossible to have continuity, to efficiently backfill when someone is promoted, retires, or takes another job. Contracts is in abysmal shape. My organization has given up on OAM to purchase things for us and we are attempting to use other vehicles. It takes a minimum of 75 days to buy something through OAM. And it often does not happen. We haven't even gotten simple maintenance renewals done in a routine manner.					
183	182	5/3/2017	We have three systems for time keeping (People Plus, DFS and lotus notes). We have to account for every second of our time in one or more of these systems, and they all have to match up. We get 700 emails every time we travel alerting us that someone has signed something - even for a day trip! We have contracts with the Corps and contractors that are a HUGE waste of money. Having the Corps do FYR on superfund sites is a massive conflict of interest as well.	We need to build relationships based on trust. EPA does good work, butt we are very slow to respond to issues and we are terrible at explaining the science and the data to the public.	We have to get better at how we interact with the public and we have to get out in front of issues. I'm just a lowly scientist, so that's for the public affairs people to figure out.	There is way too much administrative red tape. Managers spend half their time dealing with that stuff because apparently we can't trust our employees to put in an 8 hour day. Just get rid of all of it, and if someone isn't performing then fire them. Managers and employees could then spend their time on doing more work in-house and cutting out the contracts, which eat away at our budgets.	We have a number of new tools (apps like enviromapper) that are going to be amazing. We can use these tools in the field and hopefully develop more.	Superfund site management is often shared with the states. I would say the states should be given more of these sites to manage, but it depends on the state (some do a better job than others). We have a rough relationship with DOE and DA on a number of Federal Facility sites. They appear to have as much red tape and wasteful spending as we do (or more). We fight with them for years and nothing gets done, and we are on the same team (supposedly).
184	183	5/3/2017	Lack of travel funds have impacted necessary travel People Plus is relatively inefficient and does not self populate with submitted leave requests Extensive write-ups and burdensome awards process is cumbersome and inefficient for the small amounts staff receive	Keep the Section 319 Nonpoint Source Program alive. States like the program and it is resulting in real environmental improvement	We already do this, so maintaining existing water grant programs is essential for the states to get their jobs done and fore effective customer service We need to be able to use our authority; otherwise the states will not follow the statutes/regulation	Streamline monetary awards process--it is burdensome Care is needed in reducing funding so as not to undo progress made (e.g., nonpoint source program) Need to keep WOTUS intact It is nearly impossible to fire incompetent staff--need to improve efficiencies for hiring and firing	More up to date electronic equipment (laptops, etc.) would help	Separate roles have been created between the different agencies--they should not be forced to consolidate duties in an artificial an nonsustainable fashion, e.g., expecting NRCS to protect water quality against nonpoint source pollution

185	184	5/3/2017	Prior to a change in our organization, all staff were informed of most everything that effected our jobs, i.e. change in processes, EPA and/or organizational priorities, etc. Now it seems that only GS-13 and above are involved in meetings significant to our jobs and the information that effect them. Much of the information passed down is watered down when it is passed down, or if it's passed down, yet those who are not in attendance at these critical meetings are expected to function at the same level of knowledge as those who receive the information. It's terrible leadership and very ineffective and inefficient. How would I address these? As an Agency we need to be more open, honest and transparent with everyone.	Open and honest communication.	Open and honest communication.	I think all staff especially administrative staff should be given opportunities to hear about all the wonderful things our Agency does for our country and other countries. If as an employee we have little knowledge of this; think about the lack of knowledge other Americans have about all the awesome things the EPA does? It doesn't make sense that we would not be more open, honest and transparent with everyone.	Not sure.	Be more open and honest with everyone. Our Agency is very secretive and this seems to be the way management are developed and conditioned to manage their responsibilities. I cannot help but wonder if this is due to a lack of leadership, inability to manage others, or something else.
186	185	5/3/2017	The agency must invest in fully staffing its contracts officer team in OAM. Also, it would be wise to hire a competent SES manager to oversee the OAM contracts team. There are glaring problems there that impact the agency as a whole. Every AAship is suffering from the lack of effective contract support.				The IT systems at EPA are draconian and the processes for securing administrative rights to do your job better are as well. There are too many hurdles placed in front of young, creative staff for developing new software, maintaining servers and providing a new generation of IT support. I appreciate our need to be cautious with computers, but if we are hiring IT specialists for a purpose, we need to give them access and the ability to do their jobs well.	

AMERICAN OVERSIGHT

	I
185	Accountability to leadership for hiring, training, and developing excellent thinkers and other leaders.
186	The private sector would NEVER pay for their computers each month! We literally buy our computers each month. The agency's efforts to consolidate IT support has never been successful. We could employ one on-site contractor for each division or office and still have a tremendous cost saving. I keep waiting for EPA's computer support contract to be featured on the Fleecing of America.

187	186	5/3/2017	Numerous levels of approval needed for permission to do anything. Final approval appears to be so far removed from the initial request that they have no idea of what they are approving/denying. Remove levels of administrative bureaucracy.	Go into the communities/tribes at the lowest possible level and ASK what they want and what they believe they need. The further removed from the end-user information comes from, the less useful it is.	Again, a "boots on the ground" approach. Interaction with end-users - people who are directly impacted by policies & procedures - is the only way to establish a productive relationship and achieve maximum ROI. People are much less interested in "studies" or "reports" than they are with usable tools - and believing that their voice has been heard.	I see multiple employees on a daily basis that have time to chit-chat for hours about TV programming, movies, sports and a host of other stuff. And if the lower levels of staff have this much "free time" how much worse does it get as you go further up the ladder. Accountability for results at every level. No results, the position is probably not necessary....	No opinion.	Reducing the size/number federal government agencies and shifting major responsibility for environmental/safety/etc to the states; again, less distance between the end-users and the policy makers.
188	187	5/3/2017	The OCFO systems governance process is inefficient. When a user has a system issue that is operational in nature (data change or defect), it can take weeks or months to get it resolved due to the many steps it must go through. The stakeholder groups do not add value, so this step in the process should be eliminated.			OCFO and OARM would perform more efficiently if they were combined. This would eliminate "ownership issues" regarding which organization bears responsibility for systems and the data contained within them. The functions of these two organizations are inter-related, however, they work in stovepipes and do not collaborate effectively on issues.		
189	188	5/3/2017	multiple checks and balances and input of data to track compliance through both state and federal systems including ICIS/PCS as well as multiple forms that need to be signed prior to leaving for inspections like Safety checklists and multimedia checklists that should all be eliminated	work cohesively towards one goal instead of feeling like we are working against each other. Many states and local governments have "buddy buddy" relationship with facilities in order to achieve a common goal, however many times it does not work to achieve federal compliance.	improve the Citizen complaint system that automatically sends the message to the appropriate managers instead of a general complaint hotline that does not indicate the issues.	Yes, Reduction of dead weight on staff. many programs work with less numbers and achieve more results due to the few that carry the load, It should be easier to remove underachieving and underperforming employees and also reward the few who carry the majority of the load. The SEE program and the forceful employment of veterans with or without experience is detrimental to the agency. Veterans should be given priority treatment in federal agencies, however in a field that requires science or engineering backgrounds that should also be a requirement of the veteran applicants to ensure an effective workforce.	YES. many programs rely on outdated technology because the advanced technology we have never works. We constantly change from once drive to share point to whatever is out there but none of them are ever given a chance to work, and subsequently many people end up just saving their data to their computer as a result. We need to have more time to make things work.	shared responsibilities with the states are difficult. We should not have to accomplish goals for the state or vice versa in order to maintain funding or employment. We should be joined in a combined effort to achieve a common goal with state and federal resources and work together to accomplish it. Too often is there an overlap where the state asks us to do something and then also does it themselves and wastes tax dollars in prep and execution of an inspection.

190	189	5/3/2017	I am not aware of any such administrative requirements in my program.	Fully support implementation of programs at the federal, state and local levels through adequate funding.	Adequate investment allows for strong customer service.	Not at this time.	Maybe but any proposed new technologies should be piloted to assure that efficacies, effectiveness and accountability before being fully implemented.	Different agencies have unique roles relative to the same statures. However, through encouraging strong coordination at the state and local level as well as at the national level we could improve understanding of complementary responsibilities.
191	190	5/3/2017	Since I am as knowledgable or more knowledgable than many of the IT staff, it would help greatly for me to have administrator rights over my own computer. I want to be able to download needed programs, delete unneeded programs, and update everything in a timely manner. I also want to be able to diagnose and fix problems with my computer. Also, the multiple layers of management that we have are not necessary, especially for those managers that rely on a strict top-down communication process. Communication and signoff is inefficient and would be improved by eliminating some management levels.	Empower employees who are subject matter experts to communicate and make decisions directly with external parties instead of having to clear decisions with several layers of management, particularly when employees are in the field. Provide all employees who spend at least some time in the field with a purchase card that can be used for unanticipated purchases without the time consuming and inefficient process of having to get a purchase order approved at the office through several layers of signoff. Ensure that employees who work with external employees have the opportunity to master advanced communication skills for working with diverse audiences. Engineers and scientists who work in the field but can't tailor their messages to each individual audience are not helping matters. Provide all employees who work	Empower employees who are subject matter experts to communicate and make decisions directly with external parties instead of having to clear decisions with several layers of management, particularly when employees are in the field. Ensure that employees who work with external employees have the opportunity to master advanced communication skills for working with diverse audiences. Engineers and scientists who work in the field but can't tailor their messages to each individual audience are not helping matters. Provide all employees who work in the field for some amount of time with mobile telephones or devices so that they do not need to use their own devices and complicate future legal matters. Alternately, compensate employees who must use their own devices in the field.	Eliminate postions/employees who are paid to do nothing but sit around and/or wander the halls all day. There is no need for such a large low-skilled administrative staff when higher-skilled employees can accomplish many of the same tasks by themselves. Saving this amount of salary would seem to be significant.	Provide all employees who work in the field for some amount of time with mobile telephones or devices so that they do not need to use their own devices and complicate future legal matters. Alternately, compensate employees who must use their own devices in the field. Ensure that software updates for computers and devices are made available on a timely basis so that our equipment is not running years behind private sector standards.	Eliminate redundant offices/positions/etc. and give subject matter experts more independent decision making authority.

192	191	5/3/2017				All regional office space should be redesigned to remove individual cubicles and set up "hoteling" pods. There would need to be some exceptions for positions requiring higher levels of security clearance. The result would be reduced office space equating to lower rent costs. In order to accomplish this, the Agency's telework program needs to be expanded to allow employees more AWL days-on a national level. Employees would need to "reserve" a work station for their days in the office.		
193	192	5/3/2017	Issue: separate and delayed (non-realtime) IT systems for leave, schedules, and time & attendance. Solution: update system to allow information to be entered/viewed/approved in realtime.	Acknowledge that developing partnerships and relationships requires significant time interacting with stakeholders, which rarely produces measurable/tangible results. That is, investing in partnerships can be infinitely valuable for all involved, but often cannot be quantified or measured. These investments also typically require in-person time, which would require EPA resources for travel or event hosting.	Provide staff charged with executing this function the autonomy and time to develop individual relationships. If the highest emphasis is placed on measurable outputs, relationship management (typically not measureable) will likely suffer or be placed as a lower priority than outputs.	Place higher expectations on and trust in individual employees and eliminate or streamline bureaucracy/unnecessary internal procedures that appear to be in place only to protect senior leadership.	Invest in state of the art IT equipment to create a nimble and remote workforce similar the US FDA. Seek IT resource savings in purchasing rather than leasing equipment. Provide all EPA employees with mobile devices and eliminate desk phones.	
194	193	5/3/2017	Incorporate all webforms into People Plus. These two systems should be able to communicate. Would cut down on time for each employee.	Better communication with all of our stakeholders. More meetings with NGOs and states to discuss actions that EPA is taking.	Better communication with all of our stakeholders. More meetings with NGOs and states to discuss actions that EPA is taking.		Address EZTech's inefficiencies and inability to solve tech issues. OEI and EZTech do not communicate in a manner to enable EPA staff to be provided adequate tech service. Also, figure out what will replace Lotus Notes for our important databases that are needed for our daily work. The whole tech area could be revamped. Non-tech staff should not be fixing tech issues for their co-workers when we have a contract with EZTech.

195	194	5/3/2017					Google Chrome - I work on the Intranet site for our office and it is not possible to do this work on Internet Explorer. However, my request for Chrome has been denied twice. Create a Drupal distribution for all of the EPA offices to use for their Intranets, but allow customization within the platform.	
196	195	5/3/2017	The agency has not issues a Quality Assurance Project Plan (QAPP) defining the QA standards for imaging of hardcopy records or issues a policy statement from the Office of General Counsel ruling that scanned images of "wet signatures" are sufficient for record retention. Without this guidance and policy, the agency maintains many records in both digital (convenience) copies and hardcopy (record copy). This increases storage and maintenance costs for the agency. The OGC should issue clear policy that scans of hardcopy can (and should) be maintained as record copy as long as scans have followed CIO guidance and a QA has been performed following the QAPP. Scanned hardcopy should be destroyed after 6 months (except in the case of litigation hold). The QAPP should address how to handle legacy imaging efforts and pre-accessioning of permanent records to the national Archives. The OGC should work with OEI to identify remaining hardcopy workflows (such as management signatures) and implement	EPA partners (states, tribes, local communities, contractors, regulated organizations, public groups) should be encouraged (or required where possible) to provide records to the agency in electronic format only. The standards for these submissions should meet agency and NARA preservation requirements (based on the retention schedule for the records) and include easily extracted, imported, and standardized metadata to allow the records to be accessed an searched in agency recordkeeping systems. This will reduce agency storage and management costs as well as environmental impact of creating and shipping hardcopy records.	The agency should implement a public internet access point for each of its approved recordkeeping systems. This access point would allow the public and other stakeholders to access all Uncontrolled agency records. All agency records should be marked as Uncontrolled unless specifically noted as being Controlled (with the specific control type noted) by a trained agency official. Outside stakeholders should be allowed to add "folksonomy" metadata to publicly available records and easily access a permanent URL for access to any given record for the period of its record retention.	Yes. See above regarding electronic records management.	Yes. Field staff can use tablet computers and cell-phone, sat-phone, wifi connections to access their records electronically instead of transporting hardcopy files to field locations.	Pre-accessioning of records to the National Archives will leverage NARA's preservation expertise to ensure permanent records are not lost while also freeing up agency resources for more initial records capture and reference with less focus on storage and maintenance.

197	196	5/3/2017	Numerous layers of management are no longer necessary. For example, in the Land and Chemicals Division (LCD), Region 3, there are 4 layers of managers: (1) Director; (2) Assistant Director, i.e., Deputy Director; (3) Office of RCRA Programs Director; and (4) Materials Management Branch Director. I would remove ALL managers and leave one level of management leading team leaders for the various programs under a regulation.	Delegate ALL programs to the states and tribes. Assign EPA engineers and scientists as program managers to these delegated programs. EPA employees should reside or visit (at least once a week) the state regional office where their projects are implemented to provide guidance and leadership to the state environmental offices.	Having EPA employees actively interacting with the regulated community on a regular basis. The offices for EPA employees shouldn't be a large building in the cities, but in the local communities that they serve.	1. Eliminate most GS-15 and SES positions; such a waste of money with little return on investment. Managers usually take credit for the work that the staff does, while they sit around doing absolutely nothing other than shuffling papers. 2. Increase number of voluntary programs, where EPA staff is out on the field providing consulting and guidance to the regulated community. 3. Educate the employees in new technologies; i.e., GIS, programming, statistical analysis, marketing, economics 4. Do not allow non-profit organizations, universities, and local governments to receive grants more than once every 5 years	Oh gosh, yes! We should use open source software. Stop paying Microsoft: use Linux systems.	Explained in answer 3 and 4
198	197	5/3/2017	Right now what is preventing me from doing my job is lack of resources including funding to clean up Superfund sites. If the Administration would back its' employees and the Regions in going after businesses that pollute, more work would be completed. The lack of Enforcement and support to adequately go after polluters causes delay and additional human health and environmental damage.	Headquarters should talk to states and tribes about the work they actually want to do. The idea that work should be pushed back to states as we continue to cut funding, is difficult, preemptive and thoughtless. The reason work is sent to EPA is work, site cleanup or other issues need federal attention. National consistency is vital to businesses knowing what to expect and how to manage regulations.	EPA is historically excellent in communicating in the community. The public continues to look to EPA as the SCIENCE Agency. We need to continue to be at the forefront of science and technology to protect human health and the environment.	Budget tracking and contract management could be better integrated.	All federal agencies could stand an update to databases and technology. Budget and contract tracking always has room for improvement.	Climate change science should continue to be shared with researchers across the science community. Multiple agencies have added value.

200	199	5/3/2017	For years, the effectiveness of job performance has been hindered by severe limitations on travel. Please check out the unique travel budget at the USEPA. The ability to meet with our federal/state counterparts and see projects where federal funds are being spent is severely limited. When working with other federal agencies, state agencies, and the public, USEPA staff are constantly embarrassed by our lack of travel resources. We cannot be restricted from knowing our projects, and be accountable for our work at the same time. I have been at EPA for 30 years, and have always been told that these travel limits were imposed by Congress in order to limit USEPA's ability to enforce. Whether true or not, it also limits our non-regulatory work. USEPA Region 6 is going through a very expensive move to another building three blocks away in Dallas. The whole process keeps getting delayed, and costing more money. We are going to cubicles with low walls. The work	Do not limit ORD from gaining knowledge through research. Science is the base for all USEPA decisions. Good science is objective, and sometimes it produces information that somebody doesn't like. That in itself is no reason to discount the entire scientific process, or the dedicated scientists producing the information. We are working hard to produce good, strong scientific results. Use the science, but don't disclaim the work or the employees just because it isn't accepted by some.	More face-to-face time. This requires the ability to TRAVEL. There is no substitute for personal communication. Updated computer equipment and more current computer programs (nobody else uses Lotus Notes) would allow better interaction with our customers.	We need a complete overhaul of our travel system. It is a poor copy of another system that was used years ago. We are forced to spend certain amounts for government contracts (airline, hotels) when there are much less expensive options. Since travel is so restricted, we try to use GSA vehicles (not enough of these, and reservations are very hard to get) and spend long days (15+ hours) driving, since we have no funds for overnight stays. Get more GSA cars!	Better, newer computers with up-to-date software.	Every federal agency has a reason for its existence and a clearly defined purpose. Some areas of responsibility overlap, but these are opportunities for complimenting responsibilities and leveraging resources. The USEPA Nonpoint Source Program addresses agricultural pollution, along with other sources, but it is not redundant with USDA programs. Please make the effort to understand the purpose and benefits of individual federal programs before cutting them.
201	200	5/3/2017	The organizational process of encouraging retirement/attrition takes away a wealth of knowledge and experience that our agency could leverage to make better and more informed decisions to protect human health and the environment. The inability to hire and offer competitive salaries also hurts our ability to carry out the basic mission of the EPA.	Partnering with states, tribes, and local communities is already a forte of the EPA. Private sector partnerships, where ethically possible, is an avenue that deserves further resources.	Current hiring freeze and encouraging our experienced colleagues to retire or find jobs elsewhere greatly hinders our ability to provide quality customer service. We must encourage seasoned talent to stay at EPA, and attract new staff competitively.	Yes, morale is very low at EPA, and rhetoric from the White House and Administrator Pruitt are a key component of the low morale. Low morale causes inefficiencies. Improved messaging, based on sound science, from Administrator Pruitt would potentially improve morale at EPA.	More electric vehicles for our fleet.	We're already extremely aligned and share numerous responsibilities across the board. We need more staff, and we need to make an effort to retain experienced and seasoned staff.
202	201	5/3/2017	There is no effective senior leadership or appointed staff making it almost impossible to fulfill the tasks and duties of the EPA. The administrator is ill informed about the task, roles, and requirements of the EPA. Staff should be brought on form to educate the current administrator and his staff and to fulfill all other required appointed roles.	Continue to pursue the best available science in air quality and climate change, and to insure that the EPA has adequate resources (personnel and funding) to achieve its necessary goals.	Hire more staff.	No.	Better computers and more modern computer regulations in terms of administrative rights to computers and computer programs can improve and increase productivity.	We can take a more proactive role in protecting the American public by enacting and enforcing appropriate environmental regulations.

AMERICAN OVERSIGHT

	I
200	
201	Yes, it's called being a competitive and enjoyable place to work, the current administration seems to be working against that, make salaries competitive with the private sector, encourage talented professionals to stay at EPA, and attract new talent in a competitive fashion. Improve rhetoric from EPA leadership (i.e. Administrator Pruitt) by basing it on sound science. Simple.
202	EPA has used the world's best practices and is at the top of the field in both governmental agencies and the private sector in using science to better understand difficult scientific problems.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
203	202	5/3/2017		We need to continue to fund the state and tribal environmental programs. If we don't provide the states funding, they have no incentive to coordinate or collaborate with us. Providing funding/grants to them ensures accountability and structured process for outlining commitments, expectations and follow through. FACA and negotiated rulemaking committees or advisory groups that involve states/tribes are other good tools for developing sound policy, rules and avoiding the destructive cycle of rule litigation.	More use of social media. The general public now receives the majority of its news and information from social media sources. Additionally, less top down control of information. For information to be relevant, it needs to be timely. Long delays in seeking approval from senior level officials for sharing information with external parties is counter-productive and gives the appearance that EPA is withholding information and does not improve the level of trust with our stakeholders. Additionally, we need to be sure to fund travel for our staff to get out into communities to interact with them. We can improve image and the level of mistrust with the agency if we can get out of the office and into the field to talk to our stakeholders and explain issues to them in person and hear their input directly.			More widespread use of performance partnership agreements and grants to streamline administrative burden and reporting on states/tribes.
204	203	5/3/2017	The organization is top heavy on the management side and there are many GS15s that are basically getting paid a lot of money to do very little. You should look at all of those positions and eliminate about half of them. However, in the past when we've done that we've just moved them aside and they've been rewarded with less work and the same pay. instead, you should downgrade the positions and use the extra salary to offer more promotion potential for the people who do the work. There is no need to have two deputies in most offices. it creates an additional chain og mgt which slows down the process. Also, move FTEs out of Washington and into the Regional offices where there is much better relationships with our state and local agencies. HQ loses touch with what is actually happening and you have inexperienced people making national decisions without truly having an understanding of the local impacts. While it is necessary to have national consistency, the US is very diverse and what works in one area (i.e. CA) may not	Support nonregulatory programs. While regulations are a necessary evil, we can achieve results beyond regulations with effective partnerships and collaboration. Some examples are: Smartway, Energy Star, Airnow, Water Sense; national Clean Diesel program; Wastewise, etc. These are part of our core mission of protecting Human Health and the environment. With regard to engaging private sector, we have tried this many times before with mixed results. Take a look at the old Clinton Administration efforts on the Common Sense Initiative. Great results in industries like computers where EPA facilitated changes in how computers are manufactured to eliminate waste. Through this effort, they standardized computer manufacture and eliminated brand specific products. It did not work so well in the large	I think we do a pretty good job providing service to state, locals and tribes and pubic. One thing is that the general public calls EPA instead of state and locals on most environmental issues. When they call national numbers for help it is very frustrating. Our contractor support for many of the numbers just sucks. They are limited din what they can provide; provide standardized answers and basically frustrate the general public. Regional offices vary in how they deal with the public and some do a great job while others don't. On average, I get 5 calls a week from the general public on environmental issues related to my work. Some are really local gov't issues such as zoning and others are large issues that we can work with the states to resolve. I think we should establish a practice of helping resolve issue when a customer calls instead of telling just passing them along. Establish a national contact list for	Yes. EPA should partner with FHWA, Commerce, DOE and Ag to look at major freight corridors. I have beentrying to get us to do this for years. We should establish a freight improvement program that target critical freight corridors. Using an approach similar to what states use with priority watersheds, we should identify priority freight corridors. Then we should spend a significant portion of FHWA, DOE, Commerce, and Ag funds to improve the efficiency of those corridors. with the goal of improving overall movement on them. We address truck parking issues (there is a national freight parking group with FHWA) to increase numbers and establish no idle parking to reduce emissions (both air and water from runoff);	Remote sensing. Also, EPA should increase instead of defund the evaluation of new technologies which reduce emissions.	The DOE has experienced a significant amount of mission creep that has them doing things that are really the charge of EPA. We should look at all of the funding programs for alternative fuels throughout the federal agencies. Alt fuels are a critical part of EPA with the RFS. However, the funding is so dispersed and in some cases targeted specifically for some Congressman that you get a lot of semi duplicative programs. State programs add to that. I think one area we should look at is the state freight plans. There is not a real environmental element ot those plans, but it is an opportunity that we

AMERICAN OVERSIGHT

205	204	5/3/2017	Grain based ethanol gas for GOVs (government cars) is a waste of staff time and isn't very environmentally logical (its water intensive and uses food for energy instead of using waste or byproduct for energy).		Overloaded staff doesn't have as much time to responded to customers. Maintain or increase staffing to allow all EPA staff more time to respond to customers.	(1) Our travel system concur is rather awful. The fees seem high. The fee for booking a hotel through it vs calling yourself is high. The contract airline tickets are regularly double what a non-contract fare is. (2) Its difficult to accept travel subsidies for speaking at a conference. Its easier to just EPA's limited travel budget to attend. Making this easier to utilize these types of outside monies would be an improvement. (3) Its difficult to charge tuition for an EPA sponsored (contract trainers or EPA staff trainers) training. Having the ability to easily charge tuition for non-EPA participants (industry, states, nonprofits, other agencies) could help save money.	(1) Ereporting on permit reporting (annual reports & monitoring data) to an online database (ICIS/ECHO) that is accessible to the EPA, states and public will be a huge efficiency! (2) EPA (or at least Region 4) needs an electronic routing system for outgoing letters and correspondence! The paper system takes a long time (people have to walk it to the next step, if you are working from home or on travel you can't view it), packages sometimes get misplaced, there isn't a good way for accountability if one person in the review regularly takes forever, it wastes effort when one person hand writes their comments on the paper letter instead of going and electronically tracking their changes to the actual document, & its a huge waste	
206	205	5/3/2017	A consistent process for electronic routing and signature of documents is needed along with electronic records management rather than a paper based system. As the agency tasked with protecting the environment, we should be leading the way in electronic records but are woefully behind. More resources are needed for IT support in this area.					
207	206	5/3/2017	- Reduce the number of data calls and budget drills. - Be clear when preparing data calls and budget drills and/or hold a conference call after distributing to review the data call and respond to questions. - Work with OMB to modify CPIC reporting to			- Provide a single electronic vault solution for managing CBI and require all EPA systems to use that one solution.	#NAME?

208	207	5/3/2017	The adninistrative procedures that staff have to do have been increasing at an alarming rate. This takes time which we have so little of to do our jobs and the agency's mission of protecting human health and the environment. Reports and updates by grantees, consultants, and the private sector should not only be sent to the project officer/manager but they should also be sent to a central file maintained by the regions so that if there are questions/FOIAs they can be easily accessible and answered. In recent weeks I have spent numerous hours answering FOIAs - this could be done by FOIA officers within the region. In addition, cutting back and making all our administrative tasks (time cards, travel, etc.) would be helpful. The time spent doing these tasks could be spent on projects that are more in line with t our and the agency's mission..	Maintain and improve relationships with all parties involved in the particular projects and sites. Outreach is important and it makes for a smoother, better project if all parties are informed effectively. Try to do this from the start of the project.	Engage them, keep them informed, develop and maintain good relationships, educate them. Keep ties open through EMAILs, conversations and face to face meetings whenever possible and if travel allows - by the way, I find the latter to be the most effective. Be open, honest. We're all in this together so we need to work together. Consider and respect the opinions and the needs of all parties - take them into account when making decisions. We can't work in a bubble. Economics, sustainability, culture, recreation, life amenities, transportation, EJ, livability principals, etc. need to be considered when protecting human health and the environment but we need to be cognizant of our mission - it is paramount.. .	I am a PO in the Brownfields program and find the funding of grants a tedious, time consuming task. The development of FRs,CNs and award documents can be done in a more streamlined, efficient manner. For the most part, most of this should be done by grants personnel not technical personnel. Technical people should be negotiating and developing workplans (not enough time is dedicated to this) not filling out FRs and CNs. The time I spend on these documents is significant (especially come August and September). Perhaps a dedicated person in our section devoted to this task and other administrative might be beneficial. Or, better yet, the grants staff should be doing this. The technical lead can		We need to have a better understanding of all the responsibilities of the other agencies in order to understand how and if this can be done. I understand that streamlining and limiting duplicative practices is a goal but it also should be considered that having a different opinion on similar practices is important. Different perspectives make for a more complete, ballanced and thought out project. I think there should be more collaboration. between agencies. All programs, including enforcement, in the agency are important. There are many instances in which the states rely on the EPA to take an

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
210	209	5/3/2017	(1) Authority to make decisions needs to be devolved down to the lower levels. The increased politicalization of what should be technical decisions -- and this happens regardless of what party is in power -- has made EPA far less efficient. Senior management now gets mired in too many low level decisions. (2) The Clinton/Gore EPA reorganization in the 1990s was a disaster. Take a look at how EPA was structured in the 1980s under Reagan and George H. W. Bush as a good example of how to better organize the agency.	EPA needs to learn more about how industry works. Consider an externship program where EPA employees can go on detail to private industry. It might not be a bad idea to provide for the reverse. (2) Also, EPA should get more engaged in looking at and fostering industries use of Environmental Management Systems.	I think the level that EPA provides is pretty good given how overworked EPA staff are. I think something that really hampers this idea of better customer service is the lack of sufficient travel funds for EPA staff. They need to get out into the community and to also work more closely with State and local partners.	Many of the problems we encounter in this area are because of antiquated statutes. Every environmental statute could use reform. I think no one knows better the problems presented in this area than EPA employees that have deal with these inefficiencies every day. There was earlier effort -- one of few good things stemming from the Clinton/Gingrichtre years called "Streamlining" This was generally planned for four phases. Phase 1 - get rid of patently stupid or obsolete provisions. Phase - 2 streamline more difficult stuff in the regs. Phase 3 - Serious streamlining changes to the rules (e.g., creating self-implementing effluent guidelines instead of NPDES permits for certain kinds discharges. Finally Phase 4 -	We need better IT. Internet tools are pathetic.	Generally, agencies don't share well. Better to clearly delineate roles.
211	210	5/3/2017			Open communication with the public. Always being transparent. Clearly stating our mission to the public, and having leaders that follow through with our mission. It seems like the word of the agency gets blurred when so many mixed signals are coming from our leadership.		Access to email on our phones for even non-managers could help to increase efficiency.	By collaborating more with states. Also, my identifying our missions, are having leaders who share those same missions. That allows for the agency to move in one direction with a focus, and not dilute our mission.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
213	212	5/3/2017				Yes, your SEE program to utilize senior aged employees works at reducing cost, but you haven't increased the pay rates in decades and no one seems to care. You will find it harder to get seniors back to work when you only pay less than the minimum wage in most states. They consider it a disgrace.		
214	213	5/3/2017				Centralize and streamline shared services to serve one EPA. This includes HR, IT, Procurement, etc.--many functions that have been de-centralized and resulted in inconsistent, costly, and less effective performance/outcomes.	Centralize IT across EPA to serve one mission vs. 10 Regional CIOs and varying agendas.	
215	214	5/3/2017	I believe that the folks in EPA do good work. I have worked in the regions and HQ and have found a majority of the funds end up in HQ. It may be worth reviewing the # of folks in the regions (the ones who interact with the states) about equals the number of folks in HQ. It just seems like there should be a greater percentage of folks in the regions.	Work to stretch out environmental time frame requirements, NPDES review every 5 years vs the states have every 10 years or NAAQS review every 5 years versus every 10 years, this would take some of the enviro burden off the states.	I believe EPA needs a citizen panel of volunteers, just every day people, to assess our web sites and use of social media and ask them what they think and what they would like to see because a lot of the government websites are not intuitive at all, especially EPA's home page. Ask 10 of your friends not involved in the agency or the government to go to EPA's web page and ask them to locate 10 different things, I guarantee you they will each have varying degrees of success.	Come up with a national EPA document filing system. The military has figured this out, we should be able to as well. Speed up the electronic storage of documents, go into the regulations and statute if necessary and require electronic submittal of documents and get rid of paper copies once and for all. Paper document storage is a huge cost for EPA.	Make greater use of the web.	
216	215	5/3/2017	More easily allow access to EPA email on personal mobile devices could increase efficiency for those who are not generally at their desk. Adjust time card submission deadlines/requirements to reduce preparing amended time cards, some of which are foreseeable. Eliminate or reduce frequency of some online training (Tribal, Environmental Justice, etc.) Eliminate redundant tracking of training requirements Property tracking requirements are too burdensome, especially for small tech items that lose value quickly	Streamline requirements for corporate partnerships for research allowing better grounding of regulation	Transparency, make more data freely available so discussions can be more productive & the public can highlight areas of actual concern.	Don't approach rule makings with a schedule, saying "we have to do a new _____ rule because we haven't in 7 years". Instead survey the landscape and target the areas of actual need. We currently pay contractors to drive cars for mileage accumulation or data collection purposes. EPA employees would be happy to do this via their commute, but I believe it is seen as an impermissible benefit.	Recent IT updates allowing cloud storage are a step in the right direction. A further push by eliminating some of the old methods could help people work better collaboratively.	I prefer to do a smaller list well, and let the public direct area of focus, sometimes staff are in search of a problem for that next rule making. Often, this also leads to over complicated solutions.

217	216	5/3/2017	Our systems are to slow and use outdated coding and technology. We need larger bandwidth for work from home users. Also we do we have 18 feeder systems that all access CDW and Compass. They are all using the same information from those two systems that are just displaying it in different formats. We could cut licensing cost, system maintenance costs and fewer help ticket if we used 1-2 systems to do the same jobs.	I think open communication is vital and the understanding that the tribes, and local communities don't always have the funds to clean up the environment.	Being able to get correct information in a timely manor is vital.	yes invest in better systems and infrastructure. These will help EPA provide better services to the public in a timely manor at a cheaper cost.	Designing systems that are flexible so when processes change the system is not obsolete and in need of upgrades.	Use our expertise and contract them out to other federal agencies. this will cut the other agencies cost and increase cash coming into our agency. A good example is using our finance centers as a finance center. Why are regions still creating bills when we have a finance center that creates bills? its a duplication of efforts. Bring all bill creation to one location which will streamline the process and create one consistent product instead of eleven different products and processes.
218	217	5/3/2017	More decisions should be made at the regional and divisional levels, as opposed to HQ. Although, I understand the importance of HQ in maintaining consistency between regions, when decisions that are statutorily given the regional administrator (many of which have been delegated to division directors) are essentially made by HQ, it creates unnecessary delays.	EPA's partners appreciate consistency, but many of EPA's regulations have special rules for certain entities, i.e., energy industries, mining, agriculture, and often times, these industries are not enforced to the level other entities are. Although these industries are used to having special abilities to pollute that others don't have, it is important to have consistent regulations for everyone and to pursue all polluters the same, regardless of the perceived importance of the industry. The regulated community will adapt and succeed if regulations and enforcement are consistent. Regarding achieving better environmental results from state, tribes, and local communities, EPA must keep states and tribes accountable. Currently, EPA does not have the staffing or management support to make	EPA should better track community complaints and phone calls. Often the Regional and HQ call line forwards their concerns to staff, and there is no record of the call accountability that the concern is addressed. A simple database of these calls would make a record of the call and add accountability. If another staff person receives a call from the same citizen, they can go into the database and see what was said so they are consistent.	A more open workplace with shared work stations, eliminating cubicles and allowing liberal flexiplace policies would foster shared ideas because people would have to work without office walls. There would need to be rooms available for people who need quiet for calls or to read, but these could be shared spaces where people take turns. This would also force people to keep and use less paper and scan any documents that come in to the office.	Aerial photography and GIS could be used to identify wetlands violations. Often large wetland violations occur in remote locations. Rather than relying on the Army Corps of Engineers and citizen complaints, EPA could be more proactive to identify unauthorized wetland fill.	EPA should provide federal funding to delegated state programs for implementation to encourage more states to assume permitting programs. Also, more interagency conferences would facilitate communication between agencies. For example, meetings between U.S. Corps of Engineers, EPA, FWS, and states could foster better decision-making and implementation ideas.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
219	218	5/3/2017	The concurrence process for any documents or correspondence which is done via hardcopies. This is something that extends the process and can be done more efficiently, if done via electronic concurrence. Also, this can also be applied to the response to public inquiries.	Our program already has an effective and solid relationship with all the stated partners. However, I think being more informed, which would allow us to be more open with those stakeholders would make those relationships stronger. Sometimes the policy decisions made in HQ/DC directly affect the states and other local gov'ts and private sector stakeholders and the information doesn't come down to the regions quickly enough for us to relay the proper information to our partners. Those partners come to us at the staff and regional level when they hear any "rumors" or news, and many times we haven't been informed by upper management, on the topics that we get questions on.	I think having a better website with easier to understand topics, search engines, and directories to the proper programs and staff would make it easier for the public and others to reach the right person at the right time, instead of being bounced around. Also, I think the staff should try to look for the right contact for a caller, instead of just kicking them off to someone else or just telling them that it's not their program. Also, courtesy and professionalism go a long way.	More accountability for work being done and not being done. I think the PARS can be better utilized. Too much bureaucracy in the process of getting rid of some people that may have seniority, but do a lot less than a new employee at the agency. Also, there should be an option for temporary LWOP or a temporary PT schedule to reduce hours (and costs), instead of completely getting rid of an FTE. Also, supervisors have to be held accountable, there's no evaluation of supervisors from the bottom up.	Incorporate an official electronic recordkeeping system, so that we don't have to print out every document that has to be filed for recordkeeping purposes.	There has to be an awareness among agencies of mutual activities, responsibilities and interests. Our program has worked with other federal agencies in initiatives where there's a nexus in mutual interest and it has helped in conducting better and more effective outreach to the affected stakeholders.
220	219	5/3/2017	The logistical procedures for keeping track of my time prevent me from actually delivering services to patrons.	Blocking the Keystone Pipeline and the Dakota Access Pipeline.	Ask them what they want. We can't deliver services if we don't know what our constituents want.	Changing to high-efficiency light bulbs. More solar and wind power.	Google Chrome. Internet Explorer is highly outdated.	A number of things that the current administration has done scare me. We need provisions like the Clean Air Act to protect our environment (isn't that the point of the agency?). Climate change is real and is man-made and the removal of those pages from the website is not helpful to promoting our mission.
221	220	5/3/2017	Briefing Agency products to high levels of management greatly slows down the pace of work and creates uncertainty in whether a product will ever be released. Trusting in competent lower level managers and staff would greatly increase the efficiency of work and increase morale.	Without healthy ecosystems there is no economy. We need to internalize this message and take action to preserve the biodiversity and species health of the country. Otherwise, we will continue to lose species and ultimately undermine our own.	Create an atmosphere of openness and transparency for all. Currently, there is a hesitance to share when we are uncertain about a certain topic or idea. This type of stalling until we are absolutely certain breeds mistrust among stakeholders.		More use of videoconferencing for internal and external meetings.	

AMERICAN OVERSIGHT

	I
219	Cut out the red tape and allow employees to have ownership of their work. Also allow employees the opportunity for cross-training and cross-pollination. Many staff want to learn and work in other programs, but the bureaucracy doesn't allow them to. Some of the best practices I've seen from being in industry is the opportunity to rotate positions, so that you don't stagnate and in effect, the workforce morale increases. Also, it's beneficial for the organization because there are more skilled and knowledgeable workers in various areas and it gets away from the stovepipe approach of doing things.
220	No.

222	221	5/3/2017	The lack of consistency in the procedures and how easy the procedures are to find.	Better communication	Better communication	No	Better use of SharePoint. Perhaps hold a comprehensive training on how to use SharePoint	We are currently very well aligned with States and Federal Agencies.
223	222	5/3/2017	Developing regulations per Congressional mandates is one of our important functions requiring adequate, sustained funding since regulatory action takes 2-4 years from start to finish. Second is enforcement and oversight without which Federal regulations are useless and with no desired environmental results, requiring management support at all levels.	In my experience, delegated States are always willing partners who experience funding shortfalls as well. In some cases, States on their own initiative, have promulgated stricter regulations depending on the regional environmental goals and public demands. In my opinion, under EPA's radiation protection program, Federal and State partnership has been working well.				
224	223	5/3/2017			The Agency should tally and maintain a calculation of regulatory cost/burden for each NAICS. Understanding and managing this burden should inform rulemaking activities.	Regulatory development activities should adopt a project management approach. Notably the costs of regulatory development should be documented and managed.	The Agency should invest in modern workflow applications for core, mission critical activities. In addition, investments should be made in executive information systems (EIS) that would aggregate data from these workflow applications to allow for senior management to better understand and manage all the activities across the agency.	
225	224	5/3/2017				Reduce "administrative support" staff. All staff are trained on how to enter their travel into Concur, or can ask a coworker or supervisor for assistance, and the "administrative support" slows down the process of getting things done.	The PeoplePlus system takes a long time to enter billed hours to special accounts because of the way the webpage is set up. The webpage should be redesigned so that the user can easily enter time without wasting time.	

AMERICAN OVERSIGHT

	I
222	The Maxiflex time schedule would be great to increase work efficiency. That way employees could modify schedules to fit both their work and life schedules better. It also increases accountability of the employee to get the job done. Happier employees are better employees.
223	
224	The agency should increase the use the application of enterprise architecture methodologies in organizing its activities and information technology investments.
225	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
226	225	5/3/2017	Bean counting reports of project success. Most are ongoing and don't have a "completion" date.	Increase funding for state grants programs and regional programs. Increase staff to manage the programs and provide accountability for effective use of the funds.	Increase communication and government affairs staff to enable consistent, responsive and direct communication and coordination with states, tribes, local communities and regulated entities and to build public trust.	Set legal limits and constraints on lawsuits and FOIA requests from regulated entities.	Tablets and smartphones for all EPA employees. Highly encourage maximum use of teleworking to improve efficiency, quality of life and reduce carbon footprint for all EPA employees.	Grant EPA authority to protect America's waterways by regulating nutrient, sediment and toxic pollution from agricultural runoff. USDA should serve in an advisory capacity to provide technical expertise and funding to assist farmers in keeping waterways from being overburdened by runoff.
227	226	5/3/2017	I think there are times where the agency wants to do great things to address process inefficiencies and promote accountability, but there are times where the unions/collective bargaining units can prevent these things from happening at all or force agencies to modify them in a way that degrades the effectiveness idea. The unions are great advocates for employees, but I think there are times where they hold their own employees back from achieving more.	I think that setting joint priorities with the states and doing process improvement around those priorities can be very effective at improving partnerships and taking agencies where they need to go. I believe that continuing to involve the community, states, and local governments in the conversation is important to building partnerships. But it is also important to note that this can add to the amount of time needed to accomplish things - but hopefully with a better result.	I think it is our duty to accomplish our work as effectively and efficiently as possible. We need to do this with our partners and the country's input and we need to provide services as quickly as possible. Sometimes in effective process cause delays, sometimes it is the laws and regulations that just lead a process down the wrong path, and sometimes the nature of the issue itself leads to long lead times. I think that if we focus on making our process visual through process mapping, and using lean and other tools to improve them, we will offer better customer service to the states.	I think that having expectations with regard to organizational goals and programmatic goals will help the agency produce results in a more efficient way. I believe that this type of accountability is what pushes people to embrace process improvement in a way that leads to better results.	I'm sure there are technologies out there that would help, but I don't know of specifics. I know ultimately, some tech can be very expensive to maintain and keep updated and the process for getting technology reviewed and approved is very long.	N/A

AMERICAN OVERSIGHT

	I
226	Work with states to establish cross-border partnerships with EPA and other federal agencies for all imperiled interstate watersheds.
227	I think that lean process improvement can be a very big asset to the agency. The agency is getting older and a lot of institutional knowledge is walking out the door. Understanding what we do by getting our process out there so people understand what we do (and what we shouldn't be doing), improving/redesigning those process so that they provide value to the customer, and connecting those improvements to organizational goals can help get us where we want to go.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
228	227	5/3/2017	I don't have any suggestions for this question.	I don't have any suggestions for this question.	Advertise our success stories, you know, a lot of people do not have any idea what USEPA actually does!	Yes, there are times in my position where I'm waiting around for data or samples to be collected or a document to be completed. So I pick-up work from other Divisions that could use the help. I am limited to a 20% of my time to help other Divisions, if it's more than 20%, an SF52 for a detail has to be filled out and approved and it gets messy. If I'm doing the work of the agency and improving efficiency, let's eliminate the policy of being tied to percentages. I understand that our performance reviews need to be based on critical elements, but instead of that why not just have our PARS based on work products. Praise and value should be given to those who work across Divisions, instead of being restricted		The Army Corps of Engineers does a lot of our Superfund work from writing five year reviews, to commenting on EPA' risk assessments...no offense, but EPA can do a much better job at writing our own documents as opposed to paying the Army to do it for us, then we comment, then they fix it...it would be more efficient to just do it ourselves!
229	228	5/3/2017	1. The requirements to maintain certification as a contracts work assignment manager, task order manager and project officer are overkill/onerous/often not relevant to those levels of contracting. In addtion, FAITAS system for tracking accomplishments is difficult to use. Streamline the requirements for certification. 2. EAS is completely not intuitive for handling procurment requests. Invest in a more practical user friendly system. 3. Major investments needed to allow competent shift away from lotus notes based systems. It will require multiple millions of dollars to do it right.	EPA must continue to provide careful and comprehensive oversight of environmental programs delegated to states and tribes. Resources for this enforcement need a major increase in order to get better, important environmental results. EPA should work with the private sector through a multimodal approach (meetings, data exchange and verification, regulations) to assure that industry provides sufficient, quality controlled data that meets standards upon which EPA can evaluate progress towards environmental protection. Too often, the regulations do not require that the data provided by industry (and often states) is actually provided to EPA in a complete, well documented manner. The data elements are often given short shrift and need to be more comprehensive. By	Maintain current practice of working with states, tribes and local communities, including support through regional offices. Do you have specific examples where customer service is lacking?	Our budget is so tight that we are hamstrung from establishing efficient, effective program implementation. To maintain environmental protection for all Americans, we need MORE staff and MORE funds on average. I've worked for EPA starting under President Reagan in OP, OW, OCSPP, OAR, ORD and other programs and regions. Our resources have NEVER been so thin to accomplish all required to protect human health and the environment. Current inefficiencies arise from lack of resources. I am aware of no program that is inefficient and can reduce costs because it is fat.	"Modernization" takes a LOT of money and time, as we found from the migration from Lotus Notes to Outlook, which is still underway and has many idiosyncracies. If you pursue this path, we will need a LOT of money and careful planning up front to make sure that any new systems are well developed BEFORE they are implemented. Not sure its worth it given how starved the substantive parts of the programs are.	Make states more accountable for fully implementing regulatory programs (and maintain their funding to do so). Stop watering down federal requirements which are necessary to provide adequate protection of human health and the environment. Notify the public when states choose to adopt programs which are not as protective so the people can work with their state and local leaders to improve state decisions.

AMERICAN OVERSIGHT

	I
228	Our EMS platinum LEED certified program here in Region 7 is excellent.
229	EPA works pretty darn well compared to the nightmares I hear about at other agencies. Where is the question about how we can improve protection of human health and the environment, which is our mission? We have been working and promoting the fact that environmental and health protection can be done while supporting a robust economy. That's what our historical approach has been. Why do you pretend that this is a new notion. The civil service is/was ready to follow orders. In general, we respect that each administration has its own priorities and goals. But when you say things that are just not true, it

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
230	229	5/3/2017	The Human Resources Division processes cause significant delays and gaps in processing. For one position, it took over 21 months to fill a vacant position. In another position it has been nearly 2 years. This is partially due to managements failure to pursue filling these positions quickly, but is also due to the long time needed for HR to process actions. In one of these instances, the position was in "classification" for over 4 months. In the same position, we were forced to advertise the position again after the top candidates declined the position and the allotted time ran out. However, instead of just posting the job again, HR ran it through a full cycle which meant another 4-5 months before we could advertise. Nothing changed about the position, but HR would not simply renew it. This caused delays in work as well as additional cost to the agency as other employees had to work overtime to cover the work of the open position for such an extended time. In addition, ORD/OARs should look at			ORD is top heavy. We have too many managers and not enough researchers. Working grants and contracts with public universities more could expand the research accomplished and reduce costs.		
231	230	5/3/2017	Dealing with DC, move some management functions out of DC.			I would combine Region 2 with region 1 and 3. This would allow EPA to save rent in New York. The Region 2 Office is New York/New Jersey and could easily be split between the other 2 regional offices. I would also look to reduce the footprint in Washington DC. We are paying extremely high rents for the DC area to have management go from one meeting to another. I would look to move some of the management functions back into the finance offices or regions.	If no new technologies are going to be pursued then there needs to be a concentrated effort on improving and updating the technologies that exist today and a riddled with issues. People have been doing work arounds because EPA has not fixed current system issues. There does need to be a paperless solution so offices can attach documents into feeder systems/finance systems instead of having paper files, receiving mail, etc. This would eliminate waste and also reduce the amount of time people spend making copies and building paper files.	I would suggest combing region 2 with regions 1 and 3. I would look to move some management functions out of DC. I would also look to see what other agencies process payments, obligations, contracts, interagency agreements. How many do they process? How many people do they have working in these areas? Look to see how their process works and see if a similar process can be implemented at EPA or if we are one of the more efficient agencies then see if they have an interest in EPA doing these functions for them.

232	231	5/3/2017	While I understand the purpose behind various rules and regulations that restrict non-competitive grants and contracts, increased flexibility in this arena would save a lot of staff time and resources when a non-competitive process is the best route to take. We recently spent close to a year exploring options for getting a mere $25,000 to a project to support research, finally settling on a buy-in to a contract, when the restrictions around a non-competitive grant became too cumbersome. USDA had been able to get significantly more funding towards this project with much less time spent, due to more flexibility in their procedures.	Frankly, more resources. Limited resources means limited staff availability to see results with projects. Particularly resources towards contracts would be helpful, if more Federal staff cannot be devoted.	A more straight-forward rule-writing process. Currently, my Office does not have the ability to write rules in less than two years, and there are rules that need to be improved through modification to better serve our goals while decreasing burden on states and the public, and we cannot act on it in a timely fashion.	Yes - a huge one! My Office is extremely resistant to telework being increased past 2-3xs/week, despite the agreements in place. (I don't think anyone in my Office has gotten 4-5xs/week telework). Full time telework without dedicated office space would decrease costs, and allow the best staff to be hired/retained due to flexibility in location. I know other Federal offices (such as the PTO and the VA) implement a significant amount of telework with great benefits. I know managers are concerned about staff taking advantage and not working as effectively, but I believe with controls in place (must be available on Lync, must respond to email within a set amount of time, lose telework privileges if	See above about telework.	There is an intersection between CDC, USDA, FDA, and EPA in regards to pesticides. With FDA, it's sunscreen and peticulicides. With USDA, it's integrated pest management (and I'm sure, other areas). With CDC, it's public health pests. I'm not suggesting pesticides leave EPA, but perhaps increased coordination with other Agencies could help efficiency and alleviate any confusion.
233	232	5/3/2017	Primarily, the Quality Assurance requirements in ORD and start up work in terms of QAPPs. There have been inconsistencies over the years and a more recent push for GMP, which understandable, makes it difficult to perform research at a basic level. Making informed, albeit "on the fly" decisions on what to specifically measure happens often in basic science. To suggest that we get approval for these choices while they're being made, or even worse guess them before we have any data to support them, is impossible.	In terms of ORD, a stronger relationship would be ideal so we can develop the tools and the data to back both ecological and health impacts that are of importance in their particular region. For example, if a specific region is dealing with a specific pollutant or susceptible population, that information and need should be sent to ORD and assigned to a specific task so we can meet the evidence needs of the region. To my knowledge there is little relationship or opportunities between the scientists in ORD with regional offices.		Finding ways to retain staff that are lower on the GS schedule and thus, are generally younger and are at particular risk of leaving the agency due to fears of or actual implementation of a RIF. They are the least expensive employees compared to GS-13 and up, and the ones that particularly do the brunt of the technical work. They are also the future of the EPA and unfortunately at particular risk in the current environment. Keeping those employees, whether they be term or career, is not only cheaper than retaining one of the folks higher up but permits for sustainability in research and projects through climatic times. Your untapped opportunities are in your		

AMERICAN OVERSIGHT

	I
232	I addressed this in #4. The VA awards IT contracts, where the contractors are 100% telework. There are policies in place for accountability to ensure productivity is not impacted. There are core hours where staff are required to be available, and policies in place for the timeframe you need to respond to phone calls, Lync messages, and emails. You need to be available/online. If a contractor fails to abide by these guidelines, they are put on a PIP. If improvement is not seen, they are fired. (If not fired in the Federal workplace, then all telework privileges lost?) I believe increasing the availability of telework with these practices in place would increase efficiency,
233	In terms of travel, it would be more effective and efficient if employees were able to coordinate their own travel. Understandably some laws exist in terms of FEMA approved hotel requirements, however in particularly airfare if we were permitted to fly budget travel lines (ie Southwest or Aligent) it would save significant dollars across the agency.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
234	233	5/3/2017	The only thing that prevents me from doing my job as a scientist is a lack of enough administrative staff. Time is taken away from my official duties to fill out travel vouchers, look for hotels and airlines, fill out cumbersome training requests and perform other in-house administrative duties. Some of these should be performed by administrative staff, but many of these positions have been cut.	Partnering with all of these groups is important and requires monthly interaction, at a minimum. Workload due to smaller staff and increasing amount of time spent on administrative duties as noted above, cuts into this time.	More staff. Appropriate travel funding. Flexibility for travel such as taking office cars home the night before. Appropriate funding for the fleet of cars for inspections and general upkeep. If we can't rely on safe cars and have appropriate travel funding, we can't meet with any of these groups.	More accountability from our Contractors. Often, they provide work that is not up to par and then charge EPA for modifications. Things should be done right the first time. This wastes time and money.	IT and GIS support should be constantly updated to make our jobs seamless. I feel that we are falling behind in these areas.	I think we are already there. For example, in the Superfund program where I work we often collaborate with the United States Geological Survey, the Army Corps of Engineers, and our state counterparts, as well as our in-house scientific staff, as a team. It is the team process, and the unbiased scientific opinion that we get from other Agencies that makes things work. However, when technical funding is cut, we lose our ability to collaborate with these Agencies.
235	234	5/3/2017	Removing hurdles in management would be helpful. Staff are typically the experts in their respective fields, whereas management is supposed to just have a general idea of the type of work their staff is doing. Blocking enforcement work at the management level without real discussion is a waste of Agency time, resources and tax payer dollars. Both under the previous and current administration, management has blocked enforcement cases from going forward without proper legal or scientific justification. On several occasions, staff put forth a great deal of time into developing cases just to have management say they would like to scrap the case without even citing legal or scientific evidence to the contrary. This is "bad business" and a dis-service to the public we took an oath to help. Managers should trust and move forward staff cases unless their is a justification to not move forward. This would ensure more emission reductions and also transparency of the administration to ensure the agenda is	We should include the states on more enforcement work on the federal level and provide more enforcement assistance on the state level. We already invite states on inspections, but more flexibility in including states on enforcement matters would be helpful since they have more access to a facility. Also, we would need more enforcement personnel, but it is important to also provide assistance to the state when they are pursuing a matter to ensure that companies do not take advantage of them.	More staff that can work directly with the states and provide answers and assistance on regulatory questions. I field multiple questions from my state counterparts, but because of all the other work I do it makes it difficult to promptly reply to their needs. We also should make ourselves more transparent to the public and hold "townhall" type meetings when there are large projects being done in a community.	One opportunity that has been brought up by the union is increasing work from home days. It is possible to consolidate people where there are two people at a desk and you switch off days being in the office and at home. The drawback is that scheduling meetings and other on-site activities and also coordinating between two people may cause a drain on time resources. A way to reduce inefficiency is to retain a consistent mission for the agency. If protecting public health and the environment was always the mission, then we can maintain a focus on that and not start adjusting work to reflect other ideas. EPA was not set up to focus on job growth, that is the responsibility of the	We need to go electronic. We have sign-off procedures that require physical copies of documents, which just isn't necessary anymore with the ability to make revisions in Microsoft Word and the ability for a manager to just sign-off electronically on documents.	We can form a closer relationship with the Department of Health and other health organizations. Since our mission is protecting public health and the environment, we should work with agencies that also have resources to do research on public health effects of environmental pollutants or irregularities. Working with these agencies may reduce cost of research and development by not overlapping studies and can also shed more light on consequences of poor environmental management by using their expertise. We can also work with the Department of Agriculture to understand farmer's

	I
234	More interaction and funding to work with EPA ORD. More opportunity to collaborate with consultants, academia and other private sector scientific organizations outside of the office by attending scientific conferences and courses. Professional scientists not only need these opportunities to maintain professional affiliations, but these conferences and courses foster an exchange of ideas- and therefore possible change- within the government, often lead to greater collaboration, and a better work product.
235	In private companies, there is not much micromanagement from the headquarters. Leaving decisions up to the individual regions that know their states the best would improve efficiency. Reporting to headquarters should be left for matters that may set precedent or practices that should be adopted over all regions. This would reduce the time drain on headquarters to review enforcement documents.

236	235	5/3/2017	We have too many attorney's as managers that don't manage people, they manage projects. A real lack of leadership and decision making results. I have been in the government for 4 decades across multiple agencies. EPA has very few processes, procedures or strategic plans for the things it is doing. EPA is organized around legislative statutes versus the work it does. This creates stovepipes that do not create an effective work environment. Pollutants don't destinguish between water, air, soil, food, etc., however EPA does. It creates gaps in programs and inefficiency in decision making. The approach to date has been to rename parts of the organization versus re-organizing along work processes versus statutes.	EPA is the only agency in which I have served where we get slapped on the hand for working "outside our lane", including with State and local communities. EPA has a poor reputation for doing so, especially with state legislators. We should be actually working with state, tribes and local communities to produce results. I can't tell you the number of times that we have meetings with other federal agencies to discuss what would be good for states without having states present. For example, our regional offices should be busy with states, tribes and local communities in developing emergency response/homeland security plans which improve community resilience. Instead we have regional plans that we along with other Federal agencies develop in case we are asked to support states. This is not the "All-Hazards", whole of community	Develop specific Community Based Resiliency Workgroups, in which EPA provides direct technical support to develop emergency response, recovery and resiliency plans for "All-Hazards" as has been identified by the National Response Framework and Homeland Security Presidential Directives. There should be measurable products (e.g., Coordinated State/Tribal/Local and Federal Emergency Response/Homeland Security Plans), that are produced, then exercised against (to measure performance) and utilized during actual incidents. Over time, this should reduce the amount of costs associated with natural and man-made disasters, which improving a communities resiliency to these incidents. EPA needs state based performance measures, not the other way around which currently exists.	As I mentioned, I have worked 4 decades across the Federal government. Just looking at EPA for solutions to improvement is very limiting. For example, lets look at emergency management/Homeland Security. There are parts to this mission sprinkled across the Federal government, from FEMA, HHS/CDC, DOL, DOT, EPA, DOD, USDA, FDA, etc. Thre would be tremendous opportunities for improvements and efficiencies in cost and performance if these functions were better organized. Perhaps EPA's emergency response functions should be aligned under FEMA. Perhaps those similar functions in other parts of the Federal Government should also be aligned that way. EPA's	EPA's information technology consistently lags other federal agencies. As a result, EPA always seems to be playing catch up with information technology. A specific strategic plan with performance measures (including feedback from users) should be implemented. I can't tell you the number of lost hours in productivity due to computer downtime, inability to access information, poor search engines, broken links to information. It is often embarassing.	Align EPA's emergency response function with FEMA's. Require our regional response personnel to work with states to develop emergency response plans from the states up to regional plans (e.g., from the bottom up). As identified in Q4 above, there would be tremendous efficiencies gained across the Federal government if Emergency Response personnel were aligned and focused on support of states, tribe and local communities. Over time this could result in improved national preparedness, community resiliency and lower Federal costs in responding to emergencies. Today
237	236	5/3/2017	I work in Grants in Region **[REDACTED B6]**. There are a number of wasteful procedures. FAPIIS, the need to create totally new award amendments for almost every single change to an award (like a rebudgeting), and the entire Post Award program, which needs to be scrapped and re-invented with streamlining in mind, for starters	DON'T LET THEM OFF THE HOOK!!! For too long, we have cow-towed to inefficient, or just plain incompetent, partners. If they can't get the job done (for the very little we require of them), call them on it, withhold funds, terminate agreements, and any other tools necessary until they get the message and we get people in place that are willing and able to do the job. Money talks! And their loss of it will get action!	See above	I COMPLETELY (I know, one of the few at this agency) agree with the new administrations re-focusing on basic, original EPA jobs (Clean water, air, etc.) and getting Superfund sites clean and closed, while going after those responsible hard. I've said it for a long time-this agency's obsession with climate change (and the junk science it produced), environmental justice, etc of the past administration was WAY off base from our original mission (and politically motivated)	I'm sure there are, but tech people who know better than me can probably provide better answers	Agree with letting the states and tribes take more responsibility

AMERICAN OVERSIGHT

	I
236	Reduce the number of Attorney's in management positions, adopt leadership skills in attributes in senior management positions. Require senior managers to lead people versus manage projects. Hold senior managers to instill a work environment that is proactive in supporting states, tribes and local communities. Move more positions from HQ's to regions to better support states, tribes and local communities.
237	Again, simply make people and grantees) accountable. For too long, the past administration played favorites with 'protected' bad-apple grantee (and the same could be said for 'protected' employees. Fair and real merit based systems are the only ones that work.

238	237	5/3/2017	Using an Outlook based system (as opposed to GMAIL which is used by USAID and other federal agencies) is incredibly slow, clunky, and unnecessarily cumbersome. The fact that we are still running grant making programs via LotusNotes and IGMS is also incredibly outdated. Scheduling travel via Concur is similarly cumbersome and requires layers of approval, and this again is far clunkier than other federal agency systems. There are a number of mandated HR trainings which are really just a bureaucratic burden-- while each individual training is not that time consuming, finding the online links for them, recording your progress, and (for managers) tracking down staff who have not completed them adds up to a lot of wasted time for a training that most staff will simply skip through to get the requirement over with.			If we made significant software and technological infrastructure improvements so that grants were able to be efficiently managed and tracked through user-friendly online portals that store a comprehensive data set, we could cut the grant managing staff in half. An inordinate amount of my time goes to tracking down different numbers (e.g. last year's grant identification number, the funding amount from a grant's previous cycle, etc.), ALL of which are housed in a different online storage system within EPA. This means I'm basically manually doing the work that a proper computer system could do in moments. Data and knowledge management is a key weakness at EPA-- we have a ton of information	Text from responses above: If we made significant software and technological infrastructure improvements so that grants were able to be efficiently managed and tracked through user-friendly online portals that store a comprehensive data set, we could cut the grant managing staff in half. An inordinate amount of my time goes to tracking down different numbers (e.g. last year's grant identification number, the funding amount from a grant's previous cycle, etc.), ALL of which are housed in a different online storage system within EPA. 239	238	5/3/2017	My job is in communications. The only hindrances began recently. Just give us a list of subjects you guys don't want us to talk/write about and then let us do what we're supposed to do. How hard is that?	Our job is to protect the environment and public health, NOT to put industries with expiration dates stamped on them the freedom to further wreck the environment because of refusal to explore other economic opportunities in those communities. We need to support renewable resources and keep companies accountable to the public. If you really want to put the economy first, you should be supporting solar and other green industries and helping educate coal, oil, and gas-dependent communities on the reality of their situations instead of catering to them -- that'll get you votes, but you're harming them long-term. Renewables are the future, assuming you want to have one. Also, please stop undercutting and maligning science just because you don't like what it has to say.	Free flow of information would be nice and not having to go through a crazy amount of rigmarole to update sites and do our jobs. Also not using social media to promote the unscientific, self-serving opinion of our administrator like it's fact.	Everyone who wants to run for office in Oklahoma in the next few years should just leave. That would do wonders.	Yes, we could replace people who undercut and malign science with a BB8. That would save loads of money and improve morale.	I think we should encourage the Department of Education to start a campaign, especially in rural areas that are dependent on a single source of income with no future, like mining, to train students in different skill sets, and we should work with Energy, SBA, and other agencies, as well as Congress, to bring other types of businesses -- tech, finance, fashion, publishing, whatever -- into the middle of our country. The population concentration on the coasts is untenable for both areas of the country, and a way to improve relationships between Red and Blue states, as well as improve

240	239	5/3/2017	Management (specifically in OAR-OAQPS-SPPD). They do not trust their staff to accomplish projects, duties, tasks, etc. Micromanagement is a culture at EPA, it seems, thus very demoralizing and inefficient. They resist change to the point that it's impossible to promote new and more efficient ideas and processes to complete work with less staff. As an Administrative Specialist I'm not allowed to work on anything without my manager approving; I must CC her on EVERYTHING I send out; and ANYTHING I do, is never right. OPM's new plan for reduced management and rewarding high performers will not work here because of the mindset of management. Using myself as an example, I've complained many times that I do not have enough to do (even went to the Union) and wanted to volunteer for projects or details. My punishment for this is to make me sit in my cube for two years with no work other than barest duties. I'm not the only one this happens to. Administrative personnel are not allowed to go on details and the	I do believe that perhaps the EPA has become a bit excessive in it's requirements for certain regulations; however, taking away the Clean Power Plan and trying to renew Coal energy is absolutely RIDICULOUS! Coal had its day -- turn it into clean energy but burning coal is not environmentally sound. This is the only planet we have -- when it's gone, we will be gone as well. We need all the critters; we need clean water and air; we need to protect what is left before we destroy this planet for future generations. I do believe we need to make the state governments more accountable for regulations with the corporations/business entities in their jurisdiction. I think the Federal government should be a silent partner in that regard and only step in when it becomes a major issue. Business' and corporations should be fined or shut down if they don't comply	The EPA has had a very bad reputation in regards to customer service. Recently I was registering individuals for a hearing and I had to return emails and voicemails. One individual was shocked that I actually called her back and with less than 24 hour turnaround. WE WORK FOR THE PEOPLE, thus we shouldn't have a reputation of non compliance or collaboration. The Environmental groups should love us not hate us...we are on the same side with them or supposed to be anyways. They want what's best for the environment, we should too, not be in the pockets of big business. Unfortunately, the EPA is seen as collaborating with big business and helping to line their pockets. Mr. Pruitt's idea of getting back to basics would be fine if it meant to protect the environment instead of lining oil and energy companies pockets (i.e. his pockets). That pipeline running across America is devastating to our wild animals, and possibly humans	Reduce the management levels and force the individuals out who are not progressive or unwilling to adapt to change. Modernize the performance process' and listen to the staff. Utilize the technology that has been purchased to it's full extent and ensure staff are trained (make it mandatory). Ensure ALL EPA employees are aware of Federal policy and law. In the military, one of our major classes during boot camp was military law. We had to learn it and know it - if we didn't, we were discharged. Then tackle the regulations that are existing and update them; modernize them due to every changing environmental concerns. Think environment, not big business. This is America and having the ability to	Get rid of CMS - out dated, not user friendly. There are other programs that coordinate with Microsoft we could use for controlled correspondence which uses an electronic tracking and concurrence process already. This would reduce the printing/paper waste from doing this. Ensure that individuals writing/reviewing rules are well versed in English - grammar, punctuation, etc. Our correspondence that leaves our office is atrocious and unprofessional. Utilize SharePoint more instead of printing documents; utilize the records management file plan electronically (and ensure staff is trained on this and mandatory). By ensuring accurate records management, we could cut down on FOIA time, as well	I think the Administrative responsibilities could be shared across the office (OAR) instead of being broken by division. Some admins are over burdened while others do not have enough. I believe if we were shared and cross trained we could reduce the admin staff and still function brilliantly.
241	240	5/3/2017	The budget process is burdensome because it is difficult to plan projects past 3-6 months because it is unclear what the funding availability will be to continue projects. This is beyond our control for site related projects, but for travel for training or budgets for preparedness and homeland security projects this could be better addressed if there was direction on what the anticipated funding levels would be year to year.	We have a great working relationship with our state, tribal, and local counterparts and private industry. In recent years the availability to partner with these organizations has been minimized due to shrinking budgets both from the federal agencies and the state agencies. We have long established that having an understanding of the players and what assets each organization has to offer prior to an emergency is the most effective way to respond once an emergency occurs. Allowing more funding for travel, training, and exercises with our state, local, tribal, and private industry partners would allow the EPA to better prepare and be more efficient during responses.	EPA is requested to assist with response work, site clean-up, exercises, workshops and training by our state, local, regulated community and the public, but with the tightening of budgets for non-site related activities it has been difficult to participate in many of these events. Often times the activities we are allowed to participate in are based on the distance required to travel or the timing of the event in relation to receiving budgets for that year. By making these activities more of a priority to the agency we could better improve customer service to all of our partners public and private.	Our current records management system is based on paper records management. By converting to a digital system and developing a streamlined process for maintaining all records (i.e. e-mail, texts, instant messages, Excel spreadsheets, etc.) this would help reduce costs since currently the process is to .pdf all of these records so they can be maintained in the current system.	Allowing the use of mobile applications and mobile devices. All other private industries appear to be making the transition to smart devices such as phones and tablets. EPA needs to have the ability to utilize these devices which would make field work more efficient and effective by allowing information to be captured and transmitted in virtual real time rather than requiring information to be gathered then transferred to a digital version at the office.	Not applicable, in all of our activities EPA is requested to assist because of the lack of other federal or state agencies ability to perform the work.

AMERICAN OVERSIGHT

	I
240	No none. So frustrated and disappointed since transferring to the EPA.
241	Currently exploring ways to incorporate smart devices such as phones and tablets to conduct field work, but the ability to use technology is difficult because of the service agreements required by various third party vendors.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
242	241	5/3/2017	Remove senior management review of external communications. Eliminate recurring trainings.	The Administrator working with state and local agencies and private sector organizations to reduce and ideally eliminate public and private sector lawsuits on EPA rulemakings. Further, if those groups instead contributed money to fund research and development work in EPA as a group we would achieve better environmental results.	The public and industry would needs to understand how the Administrator's actions are improving the environment and slowing down climate change impacts. An open and transparent process supported by scientific fact is paramount to better customer service and interaction with states/local agencies and industry.	Reduce travel for senior management. Increase staff level travel.		Yes, Department of Defense should provide more funding toward cleaning up hazardous waste from federal facilities.
243	242	5/3/2017	The ability for researchers to collaborate with external partners and share data is hinder by the absence of both security policies which would facilitate broader collaboration and data sharing, as well as, the absence of public facing cloud based data repositories in which to host large volumes of data and share them respectively. I would recommend creation of public facing data hubs accessible by both EPA intramural researchers and external partners where large datasets can be hosted and research conducted in an open manner. Lastly, create security policies that would allow for placement of research data in the public domain.	I recommend expanding the use cloud based service offerings for interaction with external partners. Platform as a Service (PaaS), Storage as a Service (SaaS), Infrastructure as a Service (IaaS), and the new concept of Data as a Service (Daas) should be exploited. Outside research takes advantage of commercial solutions like Amazon, Google, Drop Box, Open Science Framework (OSF), etc... EPA researchers should be allowed to take full advantage of these technologies in conducting their research and sharing information with external parties.	I think EPA should exploit the use of field sensing equipment and Internet of Things (IOT) technology along with crowd sourcing to address environment compliance and monitoring. The data generated through these devices and sensors can be made available to the public and hopefully inform self correction of violations or conditions that fall outside of specified parameters. EPA must create the necessary enterprise infrastructure to receive, triage and interpret data from these various sources to better inform guidance, policy and regulations.	Yes, I think EPA needs to engage colleges and universities in helping us to formulate our environmental message. EPA scientist and researchers are leaders in their fields but at times their communications fail to resonate with common people. Colleges and universities through grants or other incentives can formulate communication strategies that speak to different audiences (e.g. business leaders, property owners, industry, school children, parents, and government officials) in language and terms they can understand. "Its about clean air and clean water stupid."	I think the PARS system is flawed. The appraisal system should be automated to emulate the PHS officer evaluation program. Also, the absence of a manpower structure focusing on personnel authorizations required to accomplish the EPA mission hinders the agency in planning and executing personnel management actions. We should know how many environmental scientist are needed in a given region to assure compliance with clean water regulations but we really don't. Likewise we should know how many HR specialist are needed to perform the HR functions of the agency but we don't know that either. I think DOD (go Air Force) has a better handle on personnel resource management than	I think that synergy is first discovered in the use of each other's data. For example, USGS, NOAA, NASA, and EPA combine the same datasets for their separate and distinct purposes. Facilitating the access to these data and the storage and use of the data for public consumption would be the first priority. Our current network infrastructure constrains us in sharing, transferring and using data across the federal government.

AMERICAN OVERSIGHT

	I
242	The administrator needs a new transparent process for the staff and public to clearly support all policy actions.
243	Certainly LEAN comes to mind as a best practice to make things more efficient. I also think it would be a good idea for federal employees to not be characterized as being part of the "swamp" that needs to be drained. Focusing on creating a work environment that is conducive to professional outcomes is paramount. I think EPA has to invest in their employee's development and their careers if it is going to continue to attract motivated young people (the best and brightest) in the future.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
244	243	5/3/2017	Our IT system and infrastructure needs an overhaul. We are all using repurposed, antiquated computers and accessories. You can only really do that for so long, as hardware requirements change and update. The result is that there is a general, agency-wide slowdown as everybody has to wait significantly longer for windows to open, documents to open, data to synchronize with the database. We also have OPPIN, DOCUMENTUM, SharePoint (let alone PeoplePlus, Webforms, etc) which means that data must be carefully and painstakingly segregated, copied, and relegated to separate database systems, some of which are unbelievably antiquated. Other agencies with a fraction of our funding nonetheless manage to make sure that all employees are given a new laptop every two years, which ensures that we are always kept up to date technologically. We have expertise on staff capable of addressing these issues, which would not require further funding to hire anybody else/contractors. What would be	Cities like New York City have achieved a great amount of success in outreach efforts by providing free consultancy services to achieve greener businesses. Companies are happy to combine a better public image, helping the environment, and saving money by adopting more energy sustainable and environmentally friendly practices. Note that the money isn't from tax credits and such but in the cost of running. Between a third and half of the energy consumption in this country comes from lighting, and electricity is expensive. If a company can spend a small amount of money to update their lights, they can find their energy bills dramatically reduced, saving the company substantial money. Adopting a digital document system means less cost outlay for printers, paper, toner, shredders, security protocols, and reduces	I think that people care a very great deal about keeping their environment clean. People who are old enough to have lived through the worst excesses of pollution, who have breathed smog and had their wells polluted, had a child born disabled because of lead in their drinking water and so on, these are people who know deeply how important such things are. And those people are scared right now. I think that we need to remember that while Public Health initiatives are often seen as un-sexy for funding purposes, they are important. Not just for castles in the sky reasons, but on a practical level; a healthy country and workforce is one which takes fewer sick days, is more productive when they work, are more likely to do many things that help the market and economy like build small businesses. It's a long-term payoff, but it returns dividends continually. People are scared that their concerns are not being heard, that we will go	We have written protocols, but they are typically poorly written and nobody has necessarily ever been trained on them. I think that we need a combination overhaul on our protocols and training on those protocols. And I mean real, face-to-face training, not more hour-long webinars. I think a surprising amount of time (and thus money) is wasted un-doing and redoing efforts which could have been done correctly the first time with training. Going back to Question 1, we have people on staff with the technical expertise to update a great deal of our IT system, which would mean significantly more efficient time management, saving money. Doing things like replacing broken printers would mean significantly less	See Question 1. There are many, many examples, but you have to be willing to 1. talk with your staff who actually understand these things, 2. listen to them, 3. spend money on initial outlay to reap the rewards. Quick-cut solutions simply do not work in the long term. Too many people who understand technology will suggest a small change which will vastly improve efficiency, and are then completely ignored for their efforts, which in return leads to nothing being done, and only increases frustration in the workforce. Look at this survey- will any of the suggestions here be adopted? If you care about greater efficiencies in technology, why have you not sat down with any of the IT staff, or the scientists who	I think that in areas of mutual responsibility, we need to encourage go-betweens and open sharing of information. Data may often be needlessly redacted to the point of uselessness between agencies, which results in requiring the agencies to waste time and resources re-acquiring the data through other means. This is actually a larger problem than many people realize, and it would be easily solved in many cases by having representatives who act as go-betweens between the agencies, who are trained in the hierarchies and processes of both agencies so they know the institutional languages of both
245	244	5/3/2017	Change the Science Hub -- perhaps assigning staff to populate it as opposed to foisting this burden on scientists. Right now, every time a research scientist finishes a paper, the scientist is required to enter it in SciHub. SciHub is byzantine and convoluted unless you are deeply familiar with it. Since research scientists complete only a few papers a year, and hopefully are occupying their minds with deeper, more-important problems, they never achieve familiarity with SciHub and it remains a tortuous, thankless, marathon exercise. The result is that EPA is paying large numbers of PhDs for hundreds of hours or more to painstakingly work their way through something that ought to be done by administrative staff -- a huge waste of Federal $ and mind power. Also, since your best PhDs commonly produce more than others, your best PhDs are spending more time than others on this awful exercise.	Allow PI research scientists to talk directly with states, other parties and EPA Program Offices, without being restricted by NPDs and Matrix Interfaces (MIs). Requirements to go through NPDs and MIs greatly slows the process at best. And potentially they make things worse by inserting themselves then requiring actions that only they want done, objectives not shared by any other parties in the negotiations, seemingly to make their jobs appear relevant.	Do away with, or review and adjust, several positions in the Agency and do away with the Matrix structure of funding in ORD. In the Matrix, scientists answer to line management for their responsibilities and lab space, but they answer to NPDs (through Matrix Interfaces) for research funds. The result is an overly complex, over-managed mess, often with power struggles between lab management and NPDs. With both lab management and NPD management, this structure greatly increases the manager-to-scientist ratio. But even worse, in order to get funding from the NPDs, scientists wind up spending large amounts of time in perpetual planning, as opposed to occupying that time with productive research. NPDs and MIs are supposed to connect scientists with Program Office needs. Also, NPDs control the research budget purse strings. But		Re-institute scientist web pages in ORD. University researchers and government researchers from other countries usually have these pages. These pages are how we find potential collaborators and present ourselves as potential collaborators. ORD used to have scientist webpages, but they were taken down with a vague implication that they would be replaced in several weeks to a couple of months with standard format pages. That was years ago and now there is no mention of them. The top managers have webpages, complete with photos, etc. Most scientists aren't particularly interested in having photos up, but we would like summary pages of our research areas. For better or worse, such pages

246	245	5/3/2017			More face to face meetings instead of phone calls and emails. While calls and emails are convenient they don't replace the value of meeting someone and talking face to face. However, I don't think every meeting needs to be in person - that would be burdensome in other ways, but I worry that as we shift to using more video teleconferences and emails to communicate that EPA culture will shift away from meaningful face to face meetings. EPA has largely ignored the PLAIN language initiative (http://www.plainlanguage.gov/). We have an agency filled with technical scientists, engineers and lawyers who are trained in writing for a technical audience - not the public. As civil servants we must learn to communicate our work, environmental risks, and environmental successes in plain, easy to understand language.			
247	246	5/3/2017	We have to take some training that isn't very well suited to exactly what we're doing or need to know. I would address these by making a couple of general training that applies to everyone, but allowing more control of the more specific trainings needed to the employees and their managers.	N/A.	Review and leverage newer technologies.	Yes, we should look for opportunities to automate things that make sense to automate so that more can be done with less. There are many different types of tools that can help automate/address needs of all sizes. While some things might require systems that take contractor work and a larger time and budget, EPA could also hire some staff or train some current staff to create smaller sized tools to help automate things that were being done manually. In my area of work, this has already happened and is currently still happening. We have staff that reviews applications that come in from manufacturers. Tools have been developed for them in Excel (in house, without costing any contract money) that do a lot of the	As I've mentioned in Q4. above, there are even some current technologies that don't cost extra that could already be helping us in a lot of what is done. Every computer has MS Excel, those with some training in programming can easily write programs in Excel (Excel VBA) that could automate some of the more manual and tedious portions of our work. There may be other tools like Excel VBA (e.g. powershell, etc.) that doesn't cost extra, but could help our work already. The problem is not everyone knows about tools like this, and so there may be many cases where automation is appropriate/beneficial, but those involved don't realize that. Automation may be something that seems to require hiring contractors and spending a lot of time	N/A.

248	247	5/3/2017	We are currently required to submit our time sheets by noon on the second Wednesday of the pay period - when there are still 2 1/2 days left in the pay period. This sets up a chain of inefficiency. Eight days after submission, after the time sheets have been processed, administrative staff send an email to their respective offices telling them they can now make corrections to the previous time sheet. If you have to make a change, e.g. due to unexpected sick leave, credit hours earned, etc., you have to log in to the system, un-attest your time sheet, make the changes, and re-attest. Your supervisor then has to re-approve, and someone has to process the changes. In the meantime, your leave balances are inaccurate and you have to wait a full pay period to be able to use credit hours you've earned. All of these extra steps would be eliminated if we could wait until the end of the pay period to submit our time sheets. I worked at another federal agency (same size if not bigger than EPA) where we had until COB the Monday after the pay					
249	248	5/3/2017	Duplicative reporting and review of even routine issues at higher (DC level) offices inhibits job performance and discourages employee morale. Use the existing system of reporting, or set up new ones and discard the old ones, but settle on a single system. Trust Regional management to handle routine business, and elevate appropriately to HQ.	To get better results we need new Memorandums of Agreement or Understanding with our state and tribal partners that reflect minimum program performance standards. Most MOA's or MOU's are very old and not specific in stating expectations of delegated/authorized program implementation standards.	Increase the travel budget and the funds for holding public outreach, including community meetings. We are stuck in the office and cannot reach out to the states, tribes, local communities or regulated facilities because we have no funding to get there. Face to face personal relationships build trust and reduce communication barriers and tension.	EPA should focus future hires on scientists and engineers. Having non-technical hires put into technical positions creates a long and steep learning curve that is inefficient and increases risks. Also, when I started at EPA, the Office of External Affairs had 3 people and the Environmental Justice and Tribal programs did not exist. Today, there are at least 40 people in those programs. Why? Can't we get by with 20? Finally, technical training has become almost non-existent due to a lack of training and travel funds. We can't stay current just by internet searching something.	Due to a lack of training caused by budget cuts, we cannot stay current on new technologies, so I can't answer the question with confidence.	By instituting a robust partnering and oversight program, EPA could both assist and improve state partner agencies performance. If EPA could do more visits to the state offices, and more field visits to sites with state personnel, we could all better understand the needs and work to develop efficient and lower cost solutions to issues.

250	249	5/3/2017	The travel management system - Concur - is the most inefficient travel system I've ever dealt with. It is time consuming and non-user friendly. It generally takes around 1.5, to 2 hours to create a travel authorization, and then, to voucher the trip, that is another hour to 2 hours. I suggest either requiring a administrative person to specialize in the system, where travelers in the division could provide the general information for the trip, and the administrative person could process the request. Or, revamp the Concur system to be easier to use.	Over the years, states, and especially tribes, have become less accountable for how grant funds are suppose to be used. Much of the grant funds end up paying for more staff, and less funds going to the projects that require on-the-ground best management practices to reduce pollution loads to the streams and lakes. The agency needs to have the ability to place strict guidelines on states and tribes to assure that the funds end up getting the results of load reductions as is needed.	We already are providing as best of customer service to the states and tribes as is possible. Our travel budgets have been reduced so significantly that we are unable to go into the "field" and view the projects we are providing funding to the states to implement. I use to be able to go to the state about one time per month, but now, I'm lucky to get to the state one time per year. If you asked the state or tribe what they would like EPA to do to help, they would tell you that they would like EPA to come to their state more often.	No.	See question/answer No. 2., regarding state/tribal accountability.	For instance, EPA's Nonpoint Source Program, authorized under Section 319 of the Clean Water Act, requires states to assessed their waterbodies impaired from nonpoint source pollution/runoff, and develop and implement measures to control the pollution from running off the land. In spite of the efforts of the mostly voluntary farmer initiatives supported by USDA and NRCS, most of the nations waters remain impaired by agricultural activities. Over the years, much of the EPA 319(h) funding that we receive from Congress to implement the program, is channeled by the state
251	250	5/3/2017		I work in OPPT and closely with new TSCA and Section 6. In the past months, we have been working closely with the private section to understand how they use the First 10 Priority Chemicals. As we undertake more risk evaluations, I would like to see more money budgeted for travel to visit manufacturing, processing, and use facilities to better understand how these chemicals are used. While this is an increase in spending, it will help us to develop regulations alongside the private sector that protect human health and the environment, while also being technologically feasible, timely, and economical in the eyes of the regulated community.	We need to leverage social media more and give people things that they can do on their own, in their homes and communities, to protect human health and the environment. We should be pumping out YouTube videos, Snapchats, Instagram posts, FB videos, and tweets on how each and every American citizen can do their part to ensure a healthy or healthier environment for the next generation.	I think TRI and CDR reporting should be combined. I envision an online interface like TurboTax where industry can complete both reporting requirements at the same time, each year. CDR reporting should be increased from every four years to every year. Increasing CDR reporting will actually reduce burden on the regulated community and make EPA more efficient. Given the time in between CDR reporting, institutional knowledge is lost on both the side of industry and EPA. Every four years, industry has to sit down and figure out all the rules and requirements again, and track down past data for several years. Could you easily track down all the documents you need to file your taxes from four years	OPPT has been trying to use Salesforce as a project management tool and I feel that it is like trying to use a chef's knife as a hammer. There are many options for project management software and if you search for lists of the best, you won't find Salesforce on any list. Why? Because it is not designed to be a project management tool! Yet, like many Federal projects, once we start down a path it is nearly impossible to change course and there is complete unwillingness to recognize that something doesn't work and should be abandoned. EPA and OPPT would be much better off using a different tool.

252	251	5/3/2017	In Region 7 we have an over abundance of Time & Attendance systems that create a quagmire of paperwork and take a lot of time for Management and Administrative staff to verify/correct/resubmit etc. We need electronic signatures approved to also reduce paper consumption/time. Records, we have been told that even if we are keeping records electronically we need to print copies and keep them. That is not effective at all. We need an update electronic record keeping system.			We are over staffed. Too many people stuck in their lane and won't accept other job responsibilities even though they have the time. So many people are hung up on what grade/position they are and therefore don't make an effort to accept more job duties. We need to consolidate resources in many areas but I don't see managers willing to get that done.	PeoplePlus needs to be more effective. In Region 7 we need new technology for our Time and Attendance, and leave requests/approvals etc. Digitization of documents, electronic signatures, better electronic record keeping systems need to be adopted.	Admin positions need to be really scrubbed. EOM's need to be made Administrative officers and take over more responsibility for things they are already doing. That would reduce the amount of HR assistance that Divisions/Branches require as well as budget and facilities personnel. Consolidation of duties is key for the admin positions. We have people that are Office Managers that are simply doing Time & Attendance and no other duties and yet we won't consolidate them over the region making it a more effective position.
253	252	5/3/2017	Confusing executive orders have created a level of uncertainty around the writing of both regulatory and deregulatory actions.	It's important not to solely focus on one of the above-mentioned entities. It is unclear how prioritizing work with the private sector will improve the environment. I've also heard conflicting reports of whether our role at EPA is to promote jobs or protect the environment when the two are not mutually achievable in a single action.	Reductions in funding will have a large impact on customer service. It's unclear how our office would maintain the currently level of service with 40% less staff.			

AMERICAN OVERSIGHT

	I
252	We need to adopt a lot of best practices from the private sector but LEAN events/Process Excellence events are not the way. We have way too many going on that have never been implemented. All the LEAN events do are waste 12's/13's/14's employees time for weeks/months on end in pointless meetings that produce nothing.
253	Allowing for more telework and consolidating EPA employees in the downtown office seem like easy solutions.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
254	253	5/3/2017	As a new hire coming from private industry within the past year, I have a different perspective than most. The lack of purchasing agents & cost & schedule 'engineers' mean that scientists are doing what they are potentially least good at (or at least relatively inefficient). I requested a book in October & am still waiting for it. The agency has spent probably 8-12 hours so far trying to order it, but, for various reasons, I am still waiting with no ends in sight. In my estimation & experience, an efficient, experienced procurement officer would have been able to steer around all the problems in less than half an hour.	Require risk assessments to include realistic uncertainties with each assumption. Don't allow these RAs to use assumptions with huge uncertainties. Listen to the public at public meetings & respond to each comment in writing if asked to do so. Many people that I have spoken with who went to public meetings for the new regs for (In Situ Leaching) Uranium mines felt that the decades of ISL mining experiences were ignored & instead, unproven theoretical concerns were being used to treat these natural sites as hazardous waste sites (perhaps based partially on experiences with sites using outdated surface mining techniques).	I think that we do this pretty well. I would put the fault here generally with (just) a few of our customers who under-trained, under-paid, & who have other interests than doing the best job of all of the nation. Our relationship with the public is hampered by the wide-spread selective education/lack of proper education in the public. Perhaps, by working with industry, we could do a better job of educating the general public about the balance between protecting the environment & helping industry to flourish at the same time.	see 1: have purchasing agents and cost & schedule 'engineers' instead of the credit cards. Also, have these work closely with the (Technical) Contracting Officers. Evaluate the cost of things & time when considering, planning & doing things when possible. Quit punishing the agency for the blatant unethical behaviors of a single person or a few, by stopping the implementation of knee-jerk reactions (that may have huge costs) without an evaluation of the cost of the reaction.	We do the (new) technical things pretty well as far as I can see!	see 1: have purchasing agents and cost & schedule 'engineers' instead of the credit cards for all but travel-related expenses (& have travel coordinators who know the system). Also, have these work closely with the (Technical) Contracting Officers.
255	254	5/3/2017	It is difficult to have functioning office when we still do not have political appointees in place. It would be easier to get work done if we have decision-makers.	Increase communication, especially in-person communications. Stakeholders like to work with people they know. More outreach by attending association meetings, conferences, etc. Also, we should invest in our FACAs so that they can provide sound perspectives and advice.	I hear from states and regulated communities that they would like more trainings. We should offer more courses and webinars for states, tribes, local communities, and the regulated community. Information should be more accessible. I would also make data more available. We often get a lot of requests for clarification - guidance plays a role.	Consolidate office spaces - we pay a lot in rent.	Outlook is outdated and clunky. I would suggest moving to Gmail, where we can use modern systems like googledocs to edit in real time.	Again, increased communications. People who know each other want to work with each other. Also, I would add tribes to this list!!
256	255	5/3/2017			Providing scientific expertise in a more available and digestible format, such as YouTube videos and webinars to explain and teach methods and best practices.	Use of YouTube and social media to provide in depth scientific knowledge to all.	OpenSource software, data formats such as WaterML and other OGC standards, along with tablets for data collection and submittal. Transparent and transferrable data and results.

257	256	5/3/2017	We are required to report the same things in different formats which burdens all employees in CID. For example, our gas card requires we put in the mileage at the pump which also registers the gallons purchased and total cost, but then we are required to also hand write on paper the mileage, gas quantity, total cost in a car log. It is completely duplicitous, wastes time and money, and moves us away from a modern paperless organization. Another example, is that we have to enter our time into the electronic people plus program to get paid. Afterwards, we are required to enter our time into a monthly activity report (MAR) indicating what we worked on, despite not being able to recover costs for criminal investigations. Eliminating these two unnecessary requirements could save thousands of work hours per year, paper, and frustration while allowing agents to focus on investigations. There are also many more self-imposed, unnecessary and burdensome administrative processes that could be	Direct states that are receiving federal funds to operate their delegated programs to work more in coordination with the Agency versus concealing and restricting information.	By eliminating many of the unnecessary administrative burdens cited in #1, we could devote more time to this cause.	Eliminate the layers of bureaucracy and unnecessary management positions designed as a political jobs program. Regularly perform 360 surveys specific to organizations to identify and remove the bad managers and attorneys that are hampering the efficiency of the program in favor of their own personal interests. This also involves ongoing criminal activity, but the IG has turned a blind eye towards it despite irrefutable evidence.		
258	257	5/3/2017					Electronic concurrence	
259	258	5/3/2017	This current administration's constant targeting of EPA and its programs is the main problem in trying to do my job. Trump and his constant threats targeting federal employees creates an atmosphere of fear in the workplace. His bullying in the news and on Twitter make it hard to be effective in the field. The public that I interact with regularly are as fearful and concerned that the programs I work with them on will disappear.	I already have a great partnership with the states and Tribes that I work with. By removing federal funding for programs, the states and Tribes will not be able to fund the programs that EPA supports. How stupid is this administration that they don't understand that the federal funds are what the states and Tribes use to be effective in their air, water and drinking water programs?	Expanding EPA staff to interact with states and Tribes is the answer to providing better customer service. We are already working in a reduced workforce due to several years of attrition without replacement. Threatening federal employees in the news and on Twitter creates a problematic relationship with the public because the public is unsure of whether those federal employees will be able to do their jobs.	EPA has done more with fewer people in the last 10 years. Staff has retired and not been replaced. Many of us do the jobs that 3 people used to do, with as good or better results. If you want to see more efficiency in the workplace, stop bullying federal employees. Stop making threats against federal employees. Support the work of federal employees to the public, so that they see us as partners and not as ineffective, frightened and threatened people.	SDWIS is the best way to be efficient, effective and accountable for drinking water. SDWIS-Prime, the new database under development, must be able to allow for public access to information. SDWIS-Prime has the potential to be more efficient and effective, but the money and time must be invested by the administration to make sure that it is just that. The administration cannot allow the money invested go toward something that doesn't work for EPA and states and doesn't allow for public access to information.	EPA is already aligned with other agencies to support states and Tribes.

263	262	5/3/2017	Have a stronger emphasis on removing low performers. Currently many employees that do not add value are retained because it would be difficult (administratively and personally) to remove them. However, there is also the prevailing view that any body is better than no body. The assumption for all managers is that any employees that are removed will not be replaced. To that end why even bother going through the effort of removing someone from federal service? The continued hiring freeze only perpetuates this issue and results in worse value to the public.		The offices that write rules typically have no feedback from their implementation (which is primarily performed by the states). Rule writers should not be rewarded for passing rules, but for passing rules that have measurable returns. As is, they typically duck out of site once a rule is final and leave the implementation as someone else's problem.	Eliminate most voluntary programs as compliance under such programs is typically fictitious.	Moving off EPA hosted IT servers to cloud based ones.

264	263	5/3/2017	None.	Continue with enforcement. Most states don't have the resources to properly enforce against their sources.	We actually do an excellent job of this. We could do a better job of marketing all the great work we do to help the environment in our communities.	No.	Yes. Better software, computers, timekeeping systems, document storage systems etc.	We already share responsibility with our state partners. We coordinate and work with them to carry out the missions of both of our agencies.
265	264	5/3/2017	There are no barriers to doing my job.	We already partner well with all of those stakeholders. We especially have productive partnerships with the private sector through voluntary programs to encourage businesses to reduce pollution and waste (i.e., a sign of their own internal business inefficiencies) in order to be more competitive and responsible citizens. Please protect these existing voluntary programs, which require very little federal money and encourage significant voluntary reductions of pollution and contaminated wastes.	None needed.	none.	don't know.	Don't know. We already work very closely with other federal agencies and with states.
266	265	5/3/2017		Achieving better environmental results requires that better environmental results are actually prioritized. At the local level education about the issue is going to be one of the biggest factors. If communities don't know why their water should be cleaner or that their air is dirtier than most places then they aren't going to know they can have a better life and that the EPA can help them achieve a healthier, cleaner environment. For the private sector, marketing and framing are key. Once companies, large and small, are aware of the marketing potential of being a green company then more companies will get on board with self-initiated environmental regulations. But it is the job of the government and the EPA to stay ahead of the self-regulation and lead the way in prioritizing the environment, through effective and achievable technological	Better customer service will result with better representation. The "regulated community" is vastly over represented in most federal agencies. To find out what local communities, tribes, and states really expect from customer service requires having a voice at the decision making table.	Yes. Everyday I see countless emails and documents printed out for no good reason. I would suggest limiting the amount of printouts each employee can use per quarter. This way people will start to only print what is really necessary. This would save money on paper and printer upkeep and is much greener because less paper would be used, fewer toner cartridges are being used and thrown away, and less energy is being consumed by printing needlessly. And this should definitely be a top-down led initiative. If people see that higher level managers don't have restrictions on printing then it will feel like more of a punishment for being lower on the career ladder than a cost saving and efficiency endeavor.	For higher level managers that are not in their office as much, I would suggest encouraging usage of tablets instead of printing out all their emails.	The EPA and federal government as a whole should definitely make clear to states especially, That environmental issues never stop at a state line. The EPA should realign activities by working with groups of states on issues instead of each state one at a time. The Chesapeake Bay watershed is a prime example. Initially EPA only focused on the bay itself but eventually it was realized that excessive nutrients like nitrogen, were coming from further upstream and impeding cleanup efforts. Once the EPA realized that it should be working with West Virginia, Virginia, Maryland, Delaware, and

267	266	5/3/2017	Most of the challenges relate to unfunded mandates. A major one I've worked on for the last few years is the DATA Act. A very well-intentioned piece of legislation, it required massive workload for technical experts that were already very busy. EPA was never appropriated funds to support the DATA Act and because the work demands expertise from senior, technical experts many employees with very large workloads were forced to delay existing projects to accommodate the DATA Act.	I have limited interaction with states, tribes, and local communities so I would defer to the regions on how to handle this coordination. With respect to contracting with the private sector, they can prove exceptionally valuable in coordinating on very technical projects. But the Administration should understand that a fundamental role of contractors is to keep their contract running and to identify new avenues for work/ funding. Simply deferring to private contractors to absorb responsibilities can prove deleterious to our responsibility as stewards of tax payer dollars. Many times, the federal tax payer can get a much better deal by having federal employees assume the work.	Increase transparency. When requests for service come in from a state, tribe, local governments or industry, the information should be available on EPA's public website so it is clear 1) who is making the request, 2) EPA's response to the request and 3) the time it takes EPA to respond.	If we move to hoteling workspaces and increase telework we could consolidate HQ facilities into just the Federal Triangle campus. While there would be large upfront costs to achieve this, EPA would see a ROI within a few years and then would saves tens of millions in lease costs per year.	Most of the inefficiencies in technology seem to come from the acquisition side and have to do with how effective vendors are at delaying the acquisition process. An agency should be able to identify a technology and then procure it. There are a wealth of regulations placed on agencies that make IT buying very burdensome. It also seems to easy for a vendor to entangle agency's in legal contests when their product is not selected.	My work would be very much streamlined if Congress and OMB held EPA to program area levels and did not require the agency to disaggregate resources down to the program project level. While there are benefits in allocating resources down to a more granular level, that can exponentially increase the workload to manage those resources.
268	267	5/3/2017	For many years now, our office has gotten away from hiring Administrative Professional Assistants (f/k/a secretaries), and instead continues to hire more attorneys, or students aides under the Pathway program. It has gotten so bad, that attorneys and managers do most of their own administrative work, such as typing, faxing, mailing, copying, scanning, timekeeping, travel, recordkeeping maintenance, and filing. It is such a waste of time for highly paid professionals to do bureaucratic, administrative work. It is not efficient or effective. In an office of nearly 100 attorneys, we have 5 APAs! I remember one day recently, no APAs were at work, and none of the attorneys knew how to print correspondence on letterhead!	Generally, state environmental agencies are in worse financial shape than the USEPA. Ever since 9/11, states have re-directed more funds to security and policing, and much less to environmental agencies. The states rely more and more on the USEPA to address their environmental problems. States just don't have sufficient resources. When EPA does partner with states, it usually takes the lead. Frankly, states don't usually take the lead on enforcement cases against their large employers. They usually refer those cases to the USEPA, to allow the feds to be the "gorilla in the closet."	More honesty and transparency. When our state partners do something wrong, we should let them know. Look at the Flint MI fiasco.	Not really. In my humble opinion, EPA is already working at bare-bone levels. We have come up with so many programs to reduce costs and inefficiencies over the years, I don't see that we can do much more. From turning off lights, using CFL bulbs/LED lighting, less travel, more telephone conferences, less training, less paper, higher office temperature in summer, colder in the winter, cheaper supplies, doing our own CLEs/training, less APAs, more cheap labor (student aides/contractors), lower bonuses, little to no promotions. Staff is tired and demoralized.	We've done it all.	No.

AMERICAN OVERSIGHT

269	268	5/3/2017	Absolutely no administrative assistance people, which leads to more time to complete mailings, routings, supplies, etc. We need administrative assistance for the scientists and engineers.	Need to clearly lay out the roles of each so they compliment each duty, rather than duplicate.	Need to continue being a visible and positive presence, particularly when states refuse to interact w/their communities are have difficulties interacting	Continue to do things on a geographic basis, with the ability to pull various expertise from where ever the correct people are located. Reduce the number of people in HQ. Over the years, their role and function seems to have been reduced, but the number of people in HQ has increased. They lack "real world" knowledge of the programs and how to get things done.	Continue to do as much electronically, including the adoption of electronic signatures	At the staff level, I'm not even sure what goes on at other Agencies, much less what overlap there might be. I do routinely refer citizens to other agencies when I'm aware that they utilize a complimentary program/function that fits with a project I'm working on. It also seems that other agencies have more funding and can do more with it, which I often point out to citizens.
270	269	5/3/2017	I work in EPA's Office of Research and Development. It has become bloated with middle management, program directors and directors that do not contribute to science (rather they "coordinate, direct, administer and bean count"). This management and administrative layer should be downsized substantially, and those directly involved in research and development (e.g., discovery of new information) should be preserved. 271	270	5/3/2017	The rule that EPA can not ask more than 9 different outside stakeholders a question related to collecting data/facts for an economic analysis or risk analysis without a Information Collection Request approval from OMB. Getting approval for ICRs from OMB is time consuming, costly and often so much hassle that it is avoided as much as possible. There are many economic analysis on industries where there is little publically available industry or state data. In these cases the economists will ask up 9 states or companies for data and try to base a national quantification analysis on data from just 9 states or companies or associations. We use national or most state data only when publically available over the internet or in public comments otherwise we call or e-mail up to 9 states or companies.	Have more field trips for staff to meet and learn from stakeholders at their locations and around their actual sites so EPA staff can see the actual challenges that industry and states face first hand. Also offer rotations where EPA staff can do details with industry and/or states and get paid to do so.	Have more conferences with states, tribes and local communities and also do field trips to their locations so staff can see what challenges they are facing.	How to reduce research budget for some research studies for EPA Provide an inexpensive $200-$400 grant to each PhD and/or masters student that does research for their thesis and/or PhD that concerns an area we want to have academic research and/or low cost research that quantifies and/or monetizes science, economics and/or technology. Many masters and PhD students have trouble coming up with a thesis and or dissertation topic. For subjects that would take a year or more of study consider creating an EPA office or agency wide small grant with $200- $00 award that gives the students national recognition and a small amount of funds to provide	Promote more telework. Some managers allow more staff to telework than others. By promoting more telework staff can work when they are sick without getting other co-workers ill with flue etc. Plus EPA workers can have better work life balance, reduces staff turnover and reduces the need for office space, conference room space and reduces the environmental impact of staff via driving or using busses and/or trains to get to work. More telework days for those staff that would like more telework would also allow for significant savings of transit subsidies and lack of parking spaces in the office garage.	Have a brainstorming session with states and get their input earlier in the rulemaking process and also let EPA do oversight because some states are better at enforcing regulations and violations than others. Once water, land and/or air is contaminated due to violations it is very costly and sometimes impossible to clean it up. It is better for EPA to partner with states but oversee prevention of pollution rather than just spend tons of money and years cleaning it up. Put a representative from each state in each EPA office to help partner with us. States and EPA can build stronger partnerships.
272	271	5/3/2017	The requirement to ignore the reality of climate change, in particular, carbon driven climate change. Additionally, the lack of a sufficient budget preventing me to travel to meetings to meet with federal, state, local partners. To address these issues I would ensure the senior staff understands the reality and appreciate the impact of climate change and provide adequate funding for the agency to operate.	Stop ignoring climate change! In his first brief to all hands, Administrator Pruitt mentioned he was willing "listen and learn". Nearly all of the career staff at EPA believe climate change is a real and substantial threat, however, they do not appear to be listed to and some senior staff have not learned this fact yet. All of our state, tribal, local and private sector partners also agree this is real and poses a threat. We need to work with our partners to address these issues.	Environmental issues often cross state lines. The EPA is the agency looked to in order to deal these issues. It is not a reasonable expectation that the states will be able to effectively manage cross border issues.	Yes.		We must be careful not to assume the states can take the lead on all issues. Sometimes the power of EPA comes from pressing issues on behalf of a number of states simultaneously. Our enforcement can also require nationwide changes/improvements whereas a state's authority is bounded by state borders.

273	272	5/3/2017	More staff and money. Administrative requirements: lack of staff has necessitated that higher paid technical staff must perform most of the administrative duties which were previously done by administrative assistants. Lots of these simpler tasks are now being performed by supervisors which takes them away from supporting their technical staff's needs. The current technical staff must also make up for the massive amount of technical professionals that are retiring. We are trying to accomplish so much that those of us remaining, while able to carry large work loads, have become inefficient. Even being able to hire more senior environmental employees (SEEs) could handle some of our responsibilities.	More staff and money. The Federal Facilities Remedial Clean-up program utilizes the idea of "partnering" which was initiated by the Navy many years ago to save time and money and it works very well. It is not a we vs. them scenario but we are all in this together to work towards common goals and develop a better product and are more efficient for the public. Lack of travel funds is keeping us from going into the field and working with others face to face.	More staff and money. You will never get good customer service with a lack of staff and money. We are shrinking as the populations grows exponentially. We are shrinking as more environmental issues are rising.	More staff and money. We have way to few staff members and funding to try and reduce costs and inefficiencies. I don't even have time to make clean sentences for this survey. How we have been treated for 7 years has resulted in our inefficiencies and we are no longer able to maintain environmental protection.	More staff and money. Modernize by investing in your staff's growth by providing training, allowing us to travel to work with the public and private. Technology is trying to be used to replace human interaction but only results in hurting human collaboration like the robots replaced human hands on our assembly lines.	More staff and funds. You need people and funds to accomplish things. The Federal Facilities Program is the only program that I know of that utilizes "partnering". Partnering allows a regulatory agency like EPA to facilitate working through the regulations.
274	273	5/3/2017				One of the areas I have noticed an extreme opportunity for improvement is in our travel and training expenses and processes. The issues: -We set certain per diem amounts that are then treated as the cap. -No training course offered on Concur system and best practices. -No incentives for saving money for agency. Opportunities: -Better hotel discounts if negotiated with a "preferred" chain. We contract our flights per city, we could possibly do the same for our hotels. -A possible divisional or office incentive for employees who save the

275	274	5/3/2017	OAM == procurement operations are terribly understaffed and overwhelmed (all sites). At the same time, they are extremely efficient and seem quite "over their head" in their ability to ensure EPA's contract requirements and needs are fulfilled. Allow these offices to hire, and allow for all types of recruitment incentives from other government departments/agencies. OCFO == they operate completely from a "top-down," "just do as I say" approach. Little/no engagement with EPA's offices and regions. Idea ... LISTEN! And don't just listen. One example of this craziness ... the new Payroll Allocation System. No input from elsewhere in the Agency. The fact is that a tremendous burden (time, labor) has been shifted from OCFO and placed on program offices ... overall, MORE resources will be required (not less) to implement this "improved" system. What up?!?	The federal role is need when states/localities are ignoring basic environmental/health needs of our citizens. Blanket approaches like "too much federal overreach" is insane. Look at the issues/needs. May the federal role isn't always all bad!	LISTEN! Listening is something that hasn't really been done since January 20. Citizens want environmental protection! For example, eliminating EnergyStar! Nonsense! The people want this program! Why would you eliminate it?!?	Ridiculous question. You've already made your decisions.	Doesn't matter. New technologies and new ideas are decided from above.	Look at Canada. Look at Environment Canada. We should emulate their model. I have been around long enough to know that changing the bureaucratic organization is nearly impossible, but look at the missions of EPA, USDA, Interior, and subsets of Forestry Service, Weather Service, NOAA, etc. Tremendous overlap! Waste!
276	275	5/3/2017	The one I would say hurts employees (especially the Scientists) is when the First Line Supervisor deliberately tries to prevent an employee from following the instructions/orders on assignments from the First Line Supervisor's Supervisor, the Division Director, or the IO Director. I have witnessed first hand my First Line Supervisor ordering me follow only her and her instructions/orders alone. This is not only wrong but extremely disrespectful and unprofessional and provides for an extremely hostile and degrading work environment where nothing will get done.	For achieving better Environmental Results from partnering states, tribes, local communities, and private sector, we need to work more closely with them and keep them in the loop of events related to our work with them and their work related to us with each other. There is a need for continuous communication with these and the agency. Also	The Agency and its partners all need to be as transparent as possible and also need to work for the protection of public health and welfare. Honesty needs to take a play in all interactions between the agency and their partners and the general public at large.	The agency needs to implement the process of 360 Performance Reviews for First Line Supervisors and the Employee in their branch who has the most seniority with the agency. While many Division Directors are presently reviewing the work accomplishments of First Line Supervisors during performance reviews, input should also come from the Employee in the First Line Supervisor's branch who has the most number of years with the agency. Employees should also have the right to write up Reprimands for Misconduct on each other and on First Line Supervisors when misconduct is in fact the issue. Often too many First Line Supervisors are placed into	Everyone at the agency should be using the latest Windows program and Office from MS that is available. Many divisions are still using Windows 7 while there is Windows 10 out on the market. We should also be using the same ADOBE software for 2017 so that we will not be on different pages.	This would be very difficult as Selective EPA offices and Divisions are very critical. Switching to states having to do the jobs that EPA is doing will make for a burden on the states as most do not have the manpower to do such nor can their budgets hire such highly skilled employees to do what EPA employees are presently doing.

AMERICAN OVERSIGHT

	I
275	Office of Policy -- a waste. Get rid of it.
276	As for reducing cost, a Wasteful First Line Supervisor or Manager is a useless employee and needs to be removed from federal service. An EPA Accountability Board needs to be created to deal with such issues and they should have the teeth and power to discipline employees who violate EPA Standards of Conduct.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
277	276	5/3/2017	Entering and approving time into People Plus before the pay period ends leads to the need for amendments and extra approval work. The Agency should change time approval day to after the pay period ends. The mail that we receive poses an undue burden on staff to code for the file room and the Agency spends millions of dollars per year to store in climate controlled space our paper files. Rules should be written to allow for electronic reporting by regulated entities and the Agency should devote resources to scanning the paper files we have and developing a true electronic data and document system.	Doing Lean projects with the States on each of our shared responsibilities would clarify roles and responsibilities and streamline processes by eliminating unnecessary process steps. Hold meetings with our States and let them tell us where we are needed in each of the programs.	Instituting more electronic reporting and data/document management would allow the Agency to respond more quickly to issues by identifying them earlier, and being accountable for results.	I cannot overstate how much cost and inefficiency reduction we would get from a national electronic records system. We devote far too much time to manual records management and moving paper around. Some processes that can be automated include nearly all of our administrative processes (reporting, timekeeping, routing documents), and many of our programmatic processes.	We are in desperate need of experienced and capable IT people who can develop systems that automate our processes. Throughout the Agency, documents are still routed manually for concurrence (R6 is in the process of automating that system). Reporting is done mostly manually (some Regions have automated the WAR reporting systems but there should be a national standard).	Again, in an environment of declining resources at both EPA and the State, we should not be duplicating efforts. We should work together, perhaps through facilitated Lean projects or other means, to determine who is responsible for what and then communicate effectively.
278	277	5/3/2017	1 - Excessive mandatory training and annual refresher training requirements, many of which are not mission-related or else are not applicable to all positions. Eliminate altogether "social engineering" training courses such as Anti-Harassment and Domestic Violence. 2- Excessive number and length of "litigation holds" on records. These requirements to maintain all communications, however trivial and in their original location, wreak havoc with records management efforts and clutter employee e-mail boxes. Either file the case or release the hold, so that normal records management can proceed. Many of these have gone on for years with no movement.	More meaningful implementation of the OneEPA concept to organize by geographic area or watershed rather than just by program/statute. Currently, most work in stove-piped by program/statute and collaboration between programs working the same geographic area is limited. At the Regional level, programs do not interact much with each other. Since some programs are delegated to the States, an effective team would include representation from State and local. With regard to private sector participation, potential conflicts of interest would have to be considered, especially where redevelopment efforts are concerned.	Allow Regional offices more flexibility to manage within their Region. Under the previous administration, control became centralized at the Headquarters level for all aspects of the work. Regions have been functioning as subordinate even to Headquarters contractors in some cases. Flow the funds down to the Regions where more experienced/less politicized staff can manage the work more competently and efficiently. Many Headquarters staff have little practical experience, but were given power over those at similar or even higher grade levels only by virtue of their choosing to live in the DC area as opposed to some other city. The Agency did not operate this way prior to the previous administration. Regional staff can accomplish the "back to basics" course correction.	Eliminate overly restrictive accreditation-type policies such as Quality Assurance Field Activities Procedure. Re-examine the cost-benefit of EPA participation in field and laboratory accreditation programs in general. Focus is often on minutia such as how logbooks are page numbered and not on meaningful measures such as environmental benefits. Efforts to maintain these bureaucratic structures waste time and resources that could be redirected to basic work, while providing little to no benefit in environmental protection and restricting flexibility and creativity.	Not familiar enough with IT to have specific ideas, but the contracts and invoice payment systems should be examined. Presumably, other organizations have contracts and pay invoices from their contractors. We have a lot of problems with the contracts system EAS and the finance system Compass. Maybe something better is out there. In fact, our older systems were probably better, at least from the staff perspective. Constant e-mail traffic to mass mailing lists on system down, system up, problems with system, etc. is distracting.	This concept has been tried in the past, where multiple Agencies focused on a particular "showcase community" with regard to redevelopment type grants. Not sure why it has not been pursued further, but a joint grant program where communities would compete for a grant package from multiple Agencies might be useful. Currently, leveraging from other Agencies and State and how they will be involved is considered favorably in the Brownfields grant selection process, so there is coordination at some level. Re-visit Brownfields "showcase community" concept

AMERICAN OVERSIGHT

	I
277	Region 6 has streamlined our inspection report process and we share a copy of our inspection reports with the facility and the public within 60 days of the inspection which has increased accountability and transparency and leads to faster resolution of compliance issues. We have templates and SOPs that we have shared with other Regions but only Region 9 has adopted them wholesale. That is emblematic of an issue with EPA, which is that each Region is given a lot of latitude to develop its own processes, systems, and efficiencies and there isn't a culture that encourages the wholesale adoption of efficiencies discovered/implemented by one region to all regions,
278	Technical review and other national level workgroups are a best practice at this Agency. Collaboration amongst Headquarters, all Regions, and research functions on specific contaminants or media is critical to maintaining the best science. Communication is key. Some State involvement may be useful, but obviously expanding a 15 person workgroup to a 65 person workgroup is not feasible, so State assignments would need to be considered relative to their interests and expertise.

AMERICAN OVERSIGHT

279	278	5/3/2017	There are multiple levels of accounting for work schedules, leave, training, conference attendance, etc. I have divisional paperwork, that is repeated in different formats at the office level (and potentially beyond). It is inefficient, and seems that the paperwork requirements could be streamlined across EPA.	I work in chemical risk assessment. I would like more opportunities to interface with private sector and states on best practices and modeling/estimation approaches. Due to the confidential nature of our assessments, however, we are often unable to use external programs - they must be on our secure system, not housed on a remote server, and fit to the (very limited) level of information we receive per chemical submission. This, along with entrenched practices, makes it very difficult to update existing models or implement new tools.	My field is really best suited for the federal level. Having 50 different regulations for chemical assessments sounds like complete chaos. But I do feel that my Office has given many opportunities for public and regulated community comments - either through public meetings, open comment periods, or focused meetings with stakeholders. We consider the comments we receive carefully. I appreciate the cooperation we have with industry and they information they are able to provide to inform our assessments. I don't know how, or even if we should be working more with states and local groups.	I benefit from, and feel protected by, secure Federal employment. However, I do wish it were easier to remove a poor or non-performing employee. I still think there need to be worker protections, but Federal has gone too far in the direction of retention at all costs. These poor or non-performing employees drain resources and give the rest of us a bad name. I also think the GS system could be revised. I appreciate that step and grade increases allow for good workers, with on-the-job experience, to move up the ladder. However, there are some increases that just don't make sense. For example, why should an employee with a lower degree, and less experience in general automatically be bumped to	We are hindered from adopting new technologies because our computers systems are outdated. Modernizing IT might go a long way in improving efficiency. I don't feel like my Division has an issue with accountability - at least not one we can fix. The work we do is confidential, and we cannot release proprietary information publically. In terms of personnel - I feel my Division is overly accountable - I have multiple/redundant processes for accounting for my time and effort.	There are likely overlapping projects and programs between EPA and other Federal agencies. For my Division, we generally are the only Agency tasked with our work. However we cooperate, when appropriate, with other Agencies that might be required for regulatory reasons (for example: OSHA or FDA). We have had employees serve on Details in these other Agencies and I think that form of knowledge sharing, cooperation and relationship building is very valuable!
280	279	5/3/2017	ORD is under a matrix management structure that was originally intentioned to facilitate collaborative research. This has not worked. Instead, the addition of national program research directors added a costly secondary management structure that ballooned over time (e.g. addition of deputy national program directors, matrix interfaces, project leads, task leads etc.). This second management structure is costly (e.g., 15-20% of matrix employees are non-research administrators with GS 14-15 salaries), administratively burdensome, and has effectively led us away from our core research competencies.	Go back to the original national research laboratory/center structure to completely remove matrix management structure (~15-20% of current ORD FTEs). Effective implementation will get us back to actually conducting core research to actually solve/prevent environmental problems involving our air, water and land.			See answers to question 1 & 2.

281	280	5/3/2017	Having additional employees would greatly help me to do my job. We have statutorily mandated, as well as litigation driven, duties that we must complete and do not have sufficient staff to complete those tasks in the most efficient and effective manner.To address this I would hire additional staff	It would be helpful to have additional liaisons to work with states. We are constantly hearing requests from states, tribes, and communities for technical assistance. It would help to have additional staff to create more dedicated relationships with states so we can determine their needs and address them appropriately so that they can do their jobs more effectively.	It would be helpful to have additional liaisons to work with states. We are constantly hearing requests from states, tribes, and communities for technical assistance. It would help to have additional staff to create more dedicated relationships with states so we can determine their needs and address them appropriately so that they can do their jobs more effectively.	No	The Lotus Notes platform is archaic and inefficient. It would be helpful to migrate that tool into one that is more integrated, modern, and efficient.	Our effectiveness in preventing many forms of pollution crippling our nation's waterways is severely limited by our regulatory scope regarding our ability to address non-point pollution. We need additional partnerships with other agencies to help us with this.
282	281	5/3/2017	Get rid of all of the contractors and NOWCCs and let the civil servants do all of the work.					
283	282	5/3/2017	People plus, we have hacked a very simple and useful system apart and we should have just left it alone. Its a powerful system in its own right and we didn't need to make all the changes that made using it more confusing and less effective as a time management tool. Ebusiness and CDW: we have access to salesforce now. Salesforce is a much more user oriented system, and could replace both of these systems. It is a much more user friendly interface that is designed to handle these kinds of issues. It would make the entire process run a lot smoother, and much more intuitively. Management would be able to break down their expenditures much more efficiently, it would be a huge win for the agency.	Start targeted direct citizen outreach for some of our programs to engage citizen scientists. We have an app for tracking mites on bees called epa hivescience to help track some of the possible causes of hive collapse. This is a huge issue with beekeepers. We should be contacting beekeeping youtubers and telling them about this app. Not only do we get that person involved, but we also get everyone viewing their videos involved. It might seem like they have a small viewership for youtube videos 7-15k per video, but its our target audience. This is just one example of how we could be leveraging social media more effectively in the agency.	More face to face interactions. If there is a state fair, have a booth talking about what we have done for the state. We need to focus more on individual one on one connections. Those are what will help us, and they usually don't cost much except time. You have one face to face interaction and it can change a persons mind. Citizens think they know what the EPA does and doesn't do, we need to be telling them what we actually do for them and how we do it.	Supplies and printers. The way we are approaching this is ridiculous. We should be charging each individual a printing fee and a supply fee in ebusiness and having the printers and supplies be ordered an agency wide level. We would save money buying in bulk, we would have the tools to do our job, and we wouldn't have to wait a week to get post-it notes that you need today. If you charge everybody a supply fee (whether they are full time telework or not) it would come out of everyone's budget systematically (which would make it easier to anticipate for forcasting) and it would free up the offices to focus on their mission work rather than admin tasks. We could even move PRs into the system and have it fully	Update Webforms into a cloud based system and so that we can fill out and sign all of the forms online rather than having to print anything out.	We have just started an exploration into how to utilize salesforce as a project tracking tool. It will have all the projects within a ticketing system so that management can easily track what stage different projects are in the office as well as who is attached to the project and what skills that person has. So we will be able to quickly see who is on what project so we can make sure that people are being used effectively. The other good part of this program is that you as a manager will be able to see everyones skills in your office. So if you have someone who has experience with waterfall and you want to have them learn agile

283	We should be tracking when people are here more efficiently. As we are moving into a Maxiflex environment we are going to have to start figuring out a way to tell when people are actually here. I am the timekeeper, should I be tracking down our Maxiflex people to make sure they are here when they say they are here? what is my responsibility on this? the only way I can figure is to track with the PIV card or login.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
284	283	5/3/2017		Having open lines of communications with these stakeholders is essential for achieving better environmental results. This means listening to them and, at times, traveling to meet them in person.	I have hosted several different monthly calls where EPA and states participate to discuss a particular subject matter. EPA and state participants find these to be helpful to share problems and learn from others.		Video conferencing that actually works. While we can't travel, we need to show states and other entities that we are serious about their environmental issues. When states want to meet and dedicate funds to travel but we cannot, that shows to them that we aren't serious about their environmental issues. Video conferencing that works with states, while an upfront expense, would improve our communication with states and would obviate the need for travel costs.	
285	284	5/3/2017	Now that Trump has become president, I am hampered by the desire of my management to try to make it easier for the states to skirt the requirements.	This question is an oxymoron. Due to political influence at the state and local levels, many of the states do not want to achieve better environmental results-they want to appease their main customers, who are not the public but the private sector. The private sector is almost always only interested in maximizing profit and if left to their own devices would freely pollute.	The best customer service we can provide to the people of the United States is to enforce the laws Congress has instructed us to do. This administration seems to want us to do the opposite.	The best thing that could happen at EPA would be to increase EPA's budget so that the Agency could more efficiently do its work. Decreasing its budget and getting rid of those pesky staff who are continuously trying to get states and industry to follow the law only places more of a burden on the remaining staff. Those remaining staff then must take short cuts and make risky decisions which invariably get litigated and introduce inefficiencies. Eliminate all contracting and instead hire EPA staff who will do the job better and cheaper.	Eliminate paper submissions from states and industry. Provide the staff with better, more powerful and more reliable computers. Provide real, meaningful technical training that actually has something to do with the daily duties of the staff. Improve EPA's teleconference capabilities. Obtain the next tier up version of SharePoint to improve its capabilities and make it more reliable.	Re-align the responsibilities of sister agencies like DOE, the Corps, the Dept. of Agriculture, etc., so that all environmental responsibilities are housed at EPA.

AMERICAN OVERSIGHT

	I
284	My management trusts the work that I do. They don't second guess it and they expect that I will deliver top-notch work, which motivates me to do so. Many managers in other organizations don't expect high caliber work and micro-manage, which creates distrust and produces inefficiencies. Defining roles is an important one. When we work on a case (between regions and HQ) or on a policy documents with many offices, many times it is unclear what each person's role is and what the plan is. Encourage staff to develop a plan from beginning to end of how to complete a project. Encourage offices to have
285	Incentivize advanced degrees and professional certifications and subsidize them so that more staff obtain them.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
286	285	5/3/2017	Too much middle management !!!!! Some Office Divisions have only 10 staff but 2 managers before you get to the Deputy Office Director level. EPA has a bloated middle management structure of GS 14 Branch Chiefs and team leaders, special assistants, and GS 15 Deputies and Assistant Directors. If GS 13 staff were given more responsibilities, empowered to make decisions, work without having to report to 2-3 supervisors, and achieve results without micro-management, you could eliminate 100s of these positions. Middle management stands as a roadblock to staff doing their jobs effectively and efficiently. Middle management prevents staff from communicating with upper level management which leads to redundancy and inefficiency.	Some staff and managers refuse to accept the unique relationship that the federal government has with tribes. We should be more proactive with tribes. In our office we often react to tribal issues instead of asking what can we do for tribes so they can better address issues without relying on EPA or the states. Tribes often lack the staff and resources to address environmental problems that states usually can with less EPA assistance. By only focusing on "high priority" regulated areas we neglect tribes and their failing infrastructures and polluting activities that need to be inspected. Any polluter in a tribal area is a high priority for that tribe. EPA has to start thinking that tribes and Environmental Justice communities are just as important as large cities/population areas or wealthy areas when it comes to prevention of oil and chemical	Tribes need EPA to be more present on their lands to enforce regulations. The tribes themselves are often the polluter so the tribal members have to fight their own governments since EPA isn't there to help. Large private interest are also still exploiting tribal lands and people for over 200 years. EPA needs to have the budget and staff to dedicate more enforcement in Indian Country. This will save EPA massive amount of funds that wont have to be spent cleaning up pollution from industrial activities, oil spills, chemical storage etc. Inspecting these facilities cost pennies compared to having to clean them up after years of unfettered pollution and neglect.	We have to let trust funds/dedicated funding sources be tapped to do more prevention, clean-up, inspections, enforcement, and training. Because funds like the Oil Spill Liability Trust Fund can only be used within the constraints of the overall budget for EPA, this $2.5 Billion pot collects dust and interest instead of preventing pollution. Being proactive saves money in the long run. If EPA is allowed to use more from the fund, then we must make cuts elsewhere so we don't ask Congress at all. However NOAA, Coast Guard and other agencies ask and receive more funds regularly. This is ridiculous since the trust fund isn't funded by tax dollars. By allowing EPA to utilize trust funds without penalizing the	LEAN is a exercise that saves EPA money. Travel is a MAJOR area of abuse. $100,000s in travel dollars go to a few staff within each office/division as perks when professional duty/development travel funds should be more evenly distributed to staff. Managers often allow 1-2 GS13/14s to travel at will while most 12/13s have been denied basic training or denied travel even when the staff were invited to speak on important topics relevant to their job and expertise. In other words, travel is abused by management to hand out to their favorites and "pets". A solution and money saver would be to restrict travel even more by giving each staff person a travel budget based on their documented invites and professional	Cross agency activities are usually monitored/staffed at the highest levels only. With rare exception, staff are not allowed or encouraged to work with other agencies as much as we should. High level committees discuss mutual interest but often we find staff working on similar issues without knowing what the other agencies are already doing or how we could work together. This relates to the fighting over the smaller slices of pie issue.
287	286	5/3/2017	The Correspondence Management System (CMS), it serves no real purpose and is slow.	Protect and create more programs like Energy Star that award companies for innovative environmental practices that make them more competitive. Customers want to make good choices, let's make it easier for them. The grants we give to states, tribes and local communities don't get much publicity. I bet many organizations in the enviro field have no idea that they exist. Let's publicize them to create healthy competition for this free money. More proposals coming in = better programs. Also, when we sue foreign companies like Volkswagen, Hyundai, etc., we are protecting American business! Let's look for polluters in the places that pollute the most and then hold them accountable: India and China.	Do a marketing campaign at the local level showing before and after pictures of Superfund projects. Gowanus neighborhood now has one of the best ROI for real estate buyers, thanks to superfund - local companies there are thriving.	Go paperless. It is embarrassing how much paper we waste at an ENVIRONMENTAL organization. I would love to see the byline in our budget for paper. At the very least we need to be treating paper for the expense that it is and put a cap on how much paper an office is allowed to use. People think it is an unlimited resource.		

AMERICAN OVERSIGHT

	I
286	Empower staff to make decisions! Every AA wants to protect their kingdoms so shared responsibility is hard to achieve when the feeling is that every Office and Division is fighting over a shrinking pie. This breeds redundancy and cost EPA and the tax payers money.
287	Apparently our Microsoft Outlook deal was more expensive than it would have been to use Google Chrome. Even GSA uses Google Chrome.... GSA.

	A	B	C	D	E	F	G	H
288	287	5/3/2017	The outright denial of scientific facts and findings prevents me from doing my job (to protect human health and the environment) effectively. Leadership that rejects science and innovation and instead clings to dangerous, archaic, polluting industry in exchange for a paycheck from those industry's leaders prevents me from doing my job effectively. I would address this by imploring leadership to heed the advice of the scientific community and to stop doing the bidding of the fossil fuel and agrochemical industries. Or, if that is impossible (given current leadership's parasitic relationship with these industries) I would suggest an immediate change in leadership.	Not cutting our funding and thereby allowing us to actually do our jobs would be a great start. Not holding up our scientific findings and documents would also help.	Allowing our documents to publish in the federal register in a timely manner would allow for better, more effective communication with the public.	I see an untapped opportunity to replace current EPA leadership with someone who actually cares about our mission, which in case you've forgotten is "to protect human health and the environment".	More streamlined, modern database infrastructure would greatly increase my efficacy at work. Currently I use at least 6 different databases on a daily basis, this creates redundancy and waste. However, in order to fix this problem we would need funding to pay professionals to create a solution, something which given the current budget proposal seems unlikely to occur.	We could actually focus on protecting human health and the environment through the use of sound science.
289	288	5/3/2017	Too many layers of GS-15 management with no scientific credentials and no understanding of what is important. Scientists should answer directly to political appointees so that they can focus on and solve the most important issues. Lay off and fire as many GS-15 managers as possible.		Be responsive. Don't presume to know what is needed.	Payroll could be greatly reduced if you look at all the GS-15 management that is wholly redundant.		Reduced management allows the scientists to be directly responsive to the needs of appointed directors.
290	289	5/3/2017			Move more functions out of the Washington DC area to be closer to the customers. This approach is especially attractive where EPA is occupying rental office space at significant cost to the government and government-owned space might become available due to workforce reshaping efforts. For instance, the Office of Pesticides Programs is in the DC metro area occupying a rented building in Arlington VA. The biggest customers for the program are the regulated community (chemical manufacturers) and pesticide users with agriculture being the largest segment by far. If adequate government-owned space was available in a place like RTP, NC where OAR and ORD currently have a significant presence moving this function there might make sense. Practically all of the major chemical producers are either headquartered in that area or have a significant presence there which might facilitate those interactions. Smaller	Consolidate lab operations. Many lab functions are not directly impacting statutory and regulatory obligations and the costs of operating these facilities can be high. The key lab activities that need to be performed to support statutory obligations should be identified and opportunities to reduce the footprint and perhaps rely on private sector, university labs and/or other state and federal government facilities explored. Also, duplicative activities, even when key to fulfilling statutory obligations, should be reviewed to see if centralization is an option.

291	290	5/3/2017	At the NVFEL we do not have any specific admin requirements, management procedures, or organizational processes that prevent the job from being done. The travel system can be a nightmare and is incredibly complicated. Is it this way for a reason?	Provide better education to all regarding hazardous waste and its proper disposal. This could be in the form of webinars and/or hard-copy handouts at community centers. Also, if something is deemed unsafe for one area, don't put it somewhere else where the people have fewer powerful voices speaking on their behalf. What's bad for one or two is equally bad for others. It goes back to the Golden Rule and it's not hard: Do unto others as you would have done unto you.	Those providing customer service should realize the taxpayers are not only customers but are also our boss. Customer service classes should be provided to all those who deal routinely with the public. Many people do not know the basics of common courtesy.	While this may not be an untapped opportunity, please consider not getting rid of research and programs that work. Also consider treating all regions of the country equally.	Our computer systems are so far in the past they are almost dinosaurs. Programs that have been on our computers will disappear. Updates that should happen automatically every Friday night have to be manually triggered on Monday mornings. We should bring IT up-to-date.	There is much overlap, but perhaps it is needed. An example of this is the Flint Water Crisis. It's good someone was watching, although it appears none of the government entities was doing its job in this one. For an individual to spot this issue and bring it forward makes one wonder just what happened. Where was the State of Michigan DEQ and where was the EPA? Maybe if there was communication of ANY kind more would be accomplished. All governments seem to think of themselves as fiefdoms and woe to any other government entity that tries to accomplish anything within that fiefdom's borders.
292	291	5/3/2017	When an employee does not have to commute to the office every day of the week, it allows the employee to be more efficient in their work during their tour of duty for that day. Extensive and more accepted use of telework will provide the EPA employee with an opportunity to be more efficient and provide quality work. Generally, it appears that management at EPA has an extreme aversion to allowing the responsible employee to telework even though there may be no reason to deny it. This leads to time filing union grievances, wasting valuable staff, management and agency time. Teleworking allows EPA to save space and money - two things EPA can use more of. Money spent on commuting costs for employees can be cut by taking advantage of hoteling. EPA employees have video teleconferencing equipment available to them, but very rarely use it. Most EPA employees do not know how to use it. Being in the office every day means I cannot efficiently or effectively do my job due to constant interruptions. Implementing	Allowing the states to take more responsibility for decision made in their state. EPA should have oversight, but not choking control.	Saving money is imperative. So much money is wasted at EPA on unnecessary travel and extraneous programs funded by contractual money that had to be spent, otherwise it would be lost. Much of which, the functions have been lost, materials are stacked in a storeroom, and practices are no longer upheld, but the staff remain. Allowing employees to telework and hotel would save EPA an incredible amount of money in commuting costs, spacing costs, supply costs, utility costs, and would increase productivity if managed well.	Teleworking and hoteling. Most all work at EPA can be done remotely. Teleworking and hoteling programs save the government money and most importantly, save EPA money. If managed well, teleworking can transform EPA and pull it from the archaic business practices that cost EPA money.	Video teleconferencing for teleworking and hoteling such at the high-definition PolyCom and other screen-sharing VTC equipment. Managers can hold meetings with their entire team, share screens for illustration, and call employees anytime during the employee's tour of duty. Employees can be managed at a level that makes them accountable to their supervisors, who must manage differently, the same as when they are in the office. If managed well, employees will be more accountable than when they're in their office. Their work is qualitatively measured and the employee is available any time the supervisor calls.	

AMERICAN OVERSIGHT

	I
291	Most processes and practices in government are there for a reason. Too often government steps on the "little person." I like the checks that are in place that keep government from overstepping its bounds. That being said, I'm sure there are areas that could stand to go through Lean/Six Sigma exercises.
292	Please see all comments above regarding teleworking and hoteling.

293	292	5/3/2017					There are so many needed enterprise systems, including records management, document control, training tracking, field equipment tracking, audit tracking and corrective action tracking, etc. these nationally supported systems will reduce duplication across organizations who manage these systems differently and locally.	
294	293	5/3/2017	The paper concurrence process is cumbersome, antiquated, and highly inefficient. That we can't somehow track concurrences electronically in this day and age is shocking.	My experience is not to trust the states to do their job. They are frequently "captured" by local industries, with friends and acquaintances working on both sides, and locals fearful of losing industry to another state. Moreover, the states I work with lack resources to do even the most basic tasks.	EPA's mission to to protect human health and the environment, not provide "customer service." We aren't a cable TV company. Our longstanding education and outreach efforts seem like a great thing to continue.	Letting EPA staff do their jobs without fear of retribution from the new Administration would be a start. I'm not joking. Currently, some managers with whom I work are fearful of "rocking the boat" and don't want to be singled out by new appointees and senior staff. They are fearful of bringing new actions and continuing ones that may be seen as controversial by senior staff. This is shameful and leads to tremendous inefficiencies. Senior Staff, including the Administrator, need to identify priorities and direction for staff. The silence from HQ has been deafening.	See my response to question 1 -- we need to somehow digitize the concurrence process. I'm not a tech guy, but am shocked there is not some sort of software that would allow us to electronically sign concurrence packages.	My office can't. We are already short-staffed due to the shrinkage from 2-3 years ago. It's physically impossible to do more with less than we have; unless, of course, that is the goal of the new Administrator.
295	294	5/3/2017	In the air enforcement program, almost every case is considered national significant under HQ policy. The extra review process on all of these cases is not necessary and the Regions should be allowed to settle the majority of their case without the HQ review process.

296	295	5/3/2017	Senior management is the impediment to almost all things. The organization needs to be streamlined to get rid of excessive high ranking positions that provide no benefit to the government and create cushy do nothing slots for people who then create pointless policies, guidance, and agendas to justify their positions. An example would be FOG (formally QAFAP) for compliance inspectors: so many restrictions and controls over inspectors that they can't effectively do their jobs anymore without passing through multiple hoops. In brief - get rid of deputies, Chiefs of Staff, "senior advisors". Make the organization flatter and more equalized in pay and responsibility so that the staff that currently actually do the work feels they are truly "OneEPA" with the management. Right now you have two EPAs - management and staff and one controls the other - so there is no sense of equality.	Don't dictate to the groups - let them tell us what they need and what leadership they want from us.	We do a fine job of this now. Again it more about listening to them rather than dictating.	Here's a scary thought (for management) - senior management should truly partner with the leadership of labor unions at EPA - so you they can actually get real insight into how to make things better. Union leadership represents the voice of the common worker at EPA and have a much better pulse where untapped efficiency are. Senior leadership is generally clueless about what the rank and file need. For example - if you are going to do a round of buyouts or are considering restructuring of the Agency - have the union leadership at the table on day one. Do not come up with a plan and then later share this already invested plan with the unions as an FYI. Have them	I can tell you this - Microsoft products are not the best and we lost a lot of efficiency when we switched 100% to them. The deal to make MS the sole provider of office tools for EPA only made some big shot money - it did not make us efficient. There are better, more stable tools out there for cloud sharing, word processing, data management, etc.	Again - talk to them and listen. What do they need from us.
297	296	5/3/2017						
298	297	5/3/2017	training may be necessary, but the way it is done, particularly for COR recertification, takes a tremendous amount of time. an integrated platform with straightforward guidance about how to fulfill requirements would make the process far more efficient. it feels like the agency skimps on the IT tools that would make it easy, at the expense of staff time and frustration.	Partnership programs like ENERGY STAR provide a model of how a small investment from the Federal government can provide leverage for significant private investment to be a powerful force for environmental protection and other public goods.	An integrated reporting platform across EPA programs, and Federal reporting programs in general, would significantly ease the burden on the regulated community without sacrificing environmental health.		Our IT processes and product have improved significantly in the last 5 years, but there is plenty more opportunity for modernization.

301	300	5/3/2017	Reduce number of managers and focus on right people/right job. Review the number of sections/section chiefs and require the managers to reapply/compete for their positions. Several technical positions are filled with employees without appropriate credentials or educational background. There are too many environmental protection specialists positions - most of these should be eliminated. Without the appropriate engineering and scientific background, the environmental issues/problems are not understood. A majority of the workforce "works from home" two days per week. while some employees are productive most appear to view these days as a day off e.g. I can't participate in a meeting because I am "working from home". There are not effective tools in place for the manager to ensure work is done and results are achieved. Changing the EPA culture starts from upper management and HQ. Consolidate the Regions and reduce the number of regions. By eliminating some of the regions, you would reduce the	Better results start with the right workforce. Unless the EPA employee is knowledgeable regarding the program and also with the right educational background better results will not be achieved. Employee attitudes need to improve - we are paid well to perform a service and protect the environment. EPA needs to work with the partners, be actively engaged, committed to achieving results - better attitudes is the first step to improving results.	Better customer service starts with the right workforce. There is not a focus on customer or public service. EPA is often confrontational instead of collaborative. The prevailing employee attitude is how many days can I avoid coming into the office and what's in it for me (more flexiplace, benefits, etc.). Eliminate daily flexible schedule work hours - it is nearly impossible to know if someone is in the office or late to work.	Reducing costs and inefficiencies starts with re-examining the workforce and changing the agency climate. Raise expectations and demand excellence and results. This has to start in the upper reaches of management. Begin by reassigning (moving) SES senior managers to encourage change in attitudes and challenge them to start asking questions as to why certain things are done, what results does this program or individual produce, do we still need this job and/or program. Challenge the SES managers to reinvent EPA making it leaner and more customer focused while still protecting the environment. Tie the SES performance to this. Scale back to the regulatory requirements and eliminate	EPA does not have an electronic document system to store/retrieve information. Paper copies are maintained at great expense and file rooms require resources (contract dollars) to support. The U.S.Government should have one HR instead of all of these individual HR centers. Just like OPM handles the retirees, one HR/personnel should manage all of the federal employees. There should be one pay center instead of each agency having their own pay center.	EPA could share lab space with other federal agencies instead of maintaining all of the individual lab spaces. By working with Corps of Engineers and USDA and others, the number of labs could be minimized yet still remain effective. Consolidate HR and pay centers into one federal system. This would also make it easier for the federal employee to change agencies.
302	301	5/3/2017	This survey is a perfect example of our managerial ineptitude. Online surveys are a well-understood and readily available off-the-shelf product. It is by now well-known that open-ended questions like this will both reduce response rates and make it very difficult to collect meaningful aggregate data. But as usual, EPA does not consider basic best practices and tries to forge ahead with a custom application that is broken from the start.	Stop this farce. The problems we face require very large sums of money to fix. In the absence of us getting meaningful funding to address things like lead pollution, nitrogen pollution, etc., we are simply rearranging the deck chairs on the Titanic.	They don't want better customer service. They want meaningful solutions. See my response to question 2.	No. In spite of the common narrative that government is wildly inefficient, I have not seen much evidence of that in my 13+ years here. We run a very tight ship. Yes, things sometimes take a long time and yes, there are sometimes frustrating layers of bureaucracy, but I don't see any huge amounts of waste.	We need to be able to improve our sensors and monitoring capabilities and use real time data. But many of our legal staff are hung up on absurdly long approval processes, often many years long. The tech world moves fast and we need to figure out how to move along with it. We cannot sit on our hands and ignore the sensor and data revolution happening around us. We also need to find a way to reshape our NPDES permitting processes so that manufacturers can start making modular, scalable treatment plants that have a very broad customer base. This will drive down costs as manufacturers achieve economies of scale and ship identical units all over the country, vs. our completely	We can't. The states have no interest in taking on the areas we currently fund, and no money to do it.

AMERICAN OVERSIGHT

	I
301	Have a "stand down". Stop regular flexiplace for a certain period of time (3 months or so) in order to re-engage the workforce. Employees who are using regular flexiplace for substitute childcare will have to make other arrangements. A change in employee attitude is definitely needed - perhaps this would be one wake up call.
302	Keep pushing on LEAN and consider adopting ISO standards wherever they are applicable.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
303	302	5/3/2017	There are requirements for peer reviews on contracts that are more burdensome than effective in most cases. Understanding the need for a "second set of eyes" look at what we're doing, it makes more sense for the Service Center Manager to determine what actions need to be peer reviewed rather than a blanket standard of everything over $3500 for which the person preparing the action is the same person signing the action. Requisition for Modifications (i.e. funds shifts) are extremely burdensome for contracting professionals.	Let the states tell us what they need rather than us tell them what they need, as appropriate and applicable.	No comments at this time, but I would like the opportunity to be able to provide input when the time arises in the future.	No comments at this time, but I would like the opportunity to be able to provide input when the time arises in the future.	I am not certain on the name of the technology, but we need to have our contract writing system to speak to our financial system to speak to our invoicing and payment system. There are a lot of manual entries being made to connect the data of these systems. Other agencies are already on board with the connected systems and it works very well.	Strategic use of existing agency vehicles through streamlining the IAA process.
304	303	5/3/2017	The COR certification process is very time-consuming and very uninformative. You don't come out of the training knowing anything more than when you started, but it takes dozens of hours every year in order to get it done. The agency should revisit its policies around COR certification to make the process less burdensome and more meaningful.				SharePoint and the G Drive are ineffective for group-based, real-time work. The agency should identify alternatives that would allow us to be more nimble and collaborative in our work.	
305	304	5/3/2017	Need electronic document sign-off		Electronic document sign-off	Electronic document sign-off	Electronic document sign-off	
306	305	5/3/2017	The Analytic Blueprint Process is tedious and time consuming, as is the ADP guidance. Using the ADP, quality actions take a minimum of 1 and a half years. There are many iterative processes that are inefficient. The entire process could be streamlined without losing the benefits the process produces.				Our electronic systems do not interact. Consider contracts. We use FAITAS, DOD, and numerous other sources to track contracts training and management CLPs. These systems do not interact. For example, when I complete annual security or ethics training, I must separately enter that I completed these items in FAITAS, which then undergoes multiple reviews before it is approved. Why does it need approval when it is mandatory training? Other systems that are not the most user friendly include travel and EAS.

309	308	5/3/2017	There is a conflict of interest, of sorts, in who decides whether Influential Scientific Information or Highly Influential Scientific Assessments needs to undergo peer review. This problem exists in both Republican and Democratic administrations, and involves program managers who are responsible for developing a policy also being the ones tasked with deciding whether the factual supporting materials (and their technical interpretations) need to undergo peer review. As a result, regulations and policies are put into place that are sometimes not factually supported. The Executive Branch would be well served by establishing a policy that creates some kind of independent body -- preferably external to -- each agency or department, that can make such judgment calls about whether peer review is needed.	I think that it is imperative that we (EPA) stay within the legal boundaries of the federal legislation enacted by Congress when performing our activities. In many instances 'partnerships' stray into legal gray areas and, once established, create continuing expectations that require staff salary money and/or grant money funded by US taxpayers. Ask the career civil service managers to give you the legal citations that underpin every single thing they're doing in their offices. (And increase staffing in the Office of General Counsel because we're going to need a LOT of lawyers to sort through stuff like this and any changes to the status quo.)	I think that it is crucial for us (EPA) to be honest with these stakeholders. That means doing things like admitting when the state of the science isn't quite there for us to be able to say whether something is "safe" when compared to some kind of benchmark; refraining from 'partnering' when there is no federal environmental legislation that authorizes a specific type of 'partnership' (see response to Question 2 above).	See response to Question 2. Please be aware, that aside from activities that stray outside legislative mandates - EPA has been through several rounds of pruning of its regulations from the William Clinton administration on, so in one sense there's not a lot left to 'prune' without endangering the plant's viability. On the other hand - I think that there may be some areas in the information collection realm that probably could stand some pruning. The hazardous waste biennial report, for example, is a big production for the regulated community, states and EPA that occurs every two years and has been going on for three decades. We could probably live with an every four years (or maybe six) schedule just fine - but that	Revamp the website: 1) just develop basic explanations of the different federal environmental laws 2) publish organization charts that show the links between those laws and the offices responsible for them 3) publish lists of staff, with their duties, in each box in the organization chart so that people on the outside world can find us; 4) publish ALL policy statements like we're required to by the Administrative Procedures Act. Also: work very hard on the nuts and bolts of the information systems and their linkages, and make it all publicly accessible. Huge needs there.	We've been at this for the past several administrations - not sure there is much 'realigning' that can be done with states. However, other federal agencies - I wonder why we have very little to do with the Interior Department. Seems odd, with the mutual interests (USGS, Bureau of Land Management, Fish and Wildlife Service....) and the Commerce Department (NOAA) and NASA for satellite imagery.
310	309	5/3/2017		We do a lot of partnering already. However, the biggest hurdle for the federal EPA is that we don't have all the tools and authorities that are states are able to have. For example, they can adopt state regulations to require electronic reporting of monitoring data from the labs, directly into a database. We cannot require that of labs, can only beg for it. So we get results by email, FAX, paper, duplicate results. Huge inefficiencies. Please pass electronic reporting requirements NATIONALLY			Yes, electronic records systems that work. We do Direct Implementation (run programs because our States or Tribes do not have primacy for various reasons) and our processes are antiquated (paper records for example). Our states are able to leverage their IT resources (across state agencies, not just their EPA) to develop robust Data Management Systems (using commercially available systems) to do this. Because of our inadequate IT, heightened security concerns that States have less worries about, etc, we at paralyzed. EPA does not have decent electronic recordkeeping in any areas.

311	310	5/3/2017	PeoplePlus is clunky and inefficient.		Being as transparent as possible.	Better centralized system for accessing resources such as Agency guidance/policy/memos/delegations, etc.	Improved interface for OneDrive or SharePoint so that using those platforms actually streamlines access to information or development of guidance/policy/rules, etc.	
312	311	5/3/2017	We need additional travel and training budget so that I can get the correct training to do my job	We have a great relationship with the states tribes & local communities. The private sector seems to want to get away with everything and not play by the rules. I think we need much more Money to pay for additional enforcement	Our web presence is antiquated. Documents produced on cleanup are not searchable and take way too long to down load. we need additional upgrades to the IT department	none-	I'm not an IT person, so please ask them	none- states don't have the money to cleanup hazardous waste sites that the government polluted
313	312	5/3/2017				Hire contractors as federal employees. The argument I have heard is that contractors are used to provide flexibility so they can work on just one project and then be done. Well guess what? Those same contract employees get hired for the next contract and the next and the next because they have the skills and experience for the job. I know many contractors who have worked here longer than me, some for 20 or more years. Overhead for contractors is a ridiculous waste. You are paying for them to manage these employees and paying EPA employees to manage the work and contract. And the TIME it takes for training and paperwork for the contract officer and work assignment officer (whatever all those

314	313	5/3/2017						
315	314	5/3/2017	The Office or Air Quality Planning and Standards (OAQPS) in OAR needs to reorganize. The work is not equitably distributed among the 5 Divisions and it's possible to realign the work into 4 or split up other work and more evenly distribute it. OAR should look at the overlaps between OAP and OAQPS as well as see if any efficiencies can be found there. If OAQPS went to 4 Divisions, I would realign the work in OID into the other four. The IT systems can go into AQAD, tribal into AQPD, EJ into HEID and training into PACs/CORE. This can be done without reducing staff. They can be reassigned. Group Leaders, Division Directors and Office directors and staff need more autonomy and trust. This goes for the last 8 years as well. We should not have to take every small decision and powerpoint up thru multiple layers of management. This is inefficient and slows us down. The administration should lay out the priorities and goals and have check-ins but not	In 1997, we partnered with state and local agencies, industry, and environmental groups to address regional transport of ozone. We negotiated together NOx requirements on power plants that resulted in the "NOx SIP Call" and included a model trading rule based on state wide NOx targets. This rule accomplished 1 million ton of reductions and reduced harmful ozone across the eastern U.S without negative economic impacts. This is one of the reasons why we have clean air. We put aside SIP due dates during this time and it paid off. I would like to see another process where we sit down with the same partners and develop a smart multi-pollutant air quality management plan process as referenced in the 2004 NAS report and in the CAAAC response to that to transform the SIP process and move toward addressing multiple pollutants at once in required air	We should convene a group of states, tribes, local agencies and the public and get there ideas about what would be helpful.	See answer to Q. 1. Also, on policy decisions we need to be careful. Rolling back the clean power plan or the ozone standard is not the way to go to maintain environmental protection for all Americans.	We need to invest in our monitoring networks and keep up with private technology on sensors. We need to KEEP AirNow and keep investing in that and making improvements. That is how we get AQ data to the public and our state and local partners. Getting everyone a high computing laptop would be helpful; especially for those staff that have to have a scientific desktop now to perform modeling. This means they are not mobile which is not the way of the future.	I'm not sure we could accomplish more by realigning with other federal agencies. And with states, we should do more cooperative work, that doesn't necessarily mean realignment. We should jointly all be investing in and engaging in projects that support renewable energy (solar, wind). We should allow SIP credit for energy efficient strategies that will reduce pollution even if those strategies are hard to quantify or have a long lead time. We should allow SIP credit for land-use measures and public transportation systems for the same reason. Our SIP process has been a disincentive for these

318	317	5/3/2017	There is a high degree of retaliation and vindictiveness in the Senior Executive Service (SES) leadership of the Agency. These individuals are placed in positions of leadership, then they stagnate like tenured faculty at a university, and control like dictators for many years until they retire. SES-level positions need to be capped at no more than 5-year terms, and if a term should be extended their direct reports should be involved in making that decision. It's time to drain the swamp of these crusty old bureaucrats!	Administrator Pruitt outlined this very well in his introduction speech to EPA staff. The Agency must become a better listener to ALL groups - not just a selected few. In order to lead, the Agency must act with civility, follow the law (i.e., CAA) and respect the rights of individual states. All the regulations we are currently trying to recall/redo are the result of the past Administration being in bed with the environmental communities and simply not listening to the American people, industry and states. EPA must lead by example.	Providing better customer service does NOT mean giving these groups everything they ask for. Rather, it means listening to their concerns, doing proper scientific/engineering evaluations and conducting appropriate economic analyses and then proceeding on path forward that is grounded in EPA's missions to protect air, water and land. If proceed with transparency, then Agency will garner support for all aspects of environmental regulatory policy development.	Absolutely! There is a lot of "dead weight" in EPA, and our SES-level managers simply ignore the waste. If EPA's senior-level leadership were held accountable for their direct reports and their productivity ... EPA would have no trouble getting its work done with the 12,000 employees targeted in the President's budget. The senior leadership at EPA has become like a country club of "good ol' boys & girls" and they simply cover for one another keep the truth from being exposed. Myron Ebell is absolutely right in saying that EPA needs to be reduced in size and scope.	Absolutely! EPA needs to come into the 21st century in terms of higher high-tech IT professionals. EPA maintains tremendous databases and software systems, yet offices like OAP and OAQPS do NOT have state-of-the-art IT professionals in leadership roles. Each office within EPA operates like a silo, and the OEI tries to hold these office-specific programs together with duct tape and band-aids. In 2017, there should not be any EPA office that does not have a senior-level position of Chief Information Office (CIO), and the different CIOs across the Agency should report to an Asst. Administrator for IT. Such an approach would eliminate the duplication of effort and gross abuse and waste of contract funding for individual office IT projects.	Case in point - NOAA and NASA were not involved at all in the background assessment for the Endangerment Finding or the Clean Power Plan. Really? Why would EPA not rely on some of the nation's greatest climatologists and meteorologists in justifying these two regulations? EPA needs to be forced to work more closely with the DOE on technology assessments and with NOAA and NASA on any future climate assessments.
319	318	5/3/2017	Hiring process needs to be expedited and should not take more than 30 days between posting of the position and selection of the applicant. Eliminate the unnecessary steps and people currently involved that do not add any value to the process. Acquisition of supplies is cumbersome and takes too long. Create a process when employees can obtain needed resources and supplies in less than 48 hours. Make it less cumbersome and time-consuming to fire dead weight.	As co-regulators, states and tribes should be able to have access to readily available EPA data to better implement their environmental programs. Create a one-stop center where states and tribes can receive consistent advise and assistance from EPA. Local communities and the private sector can benefit for equivalent one-stop center dedicated to their needs. EPA needs to create a culture of costumer-focused service.	See answer to #2. In addition, eliminate the need for paper and make everything electronic. Create a website that is not confusing to navigate and where information is easy to find.	EPA would benefit from applying Lean tools and methods to many of its processes. By definition, Lean looks to identify waste in time and resources and develop new processes that are more effective and efficient.	Eliminate paper-required transactions and develop the capability to conduct business online.	Eliminate duplicative efforts currently being conducted by several EPA organizations without them knowing that it's happening. Create consistency among the EPA regional offices to make it easier for internal and external customers to conduct business with us.

AMERICAN OVERSIGHT

	I
318	Our employee performance appraisal system is a farce! It's a quota system that ties manager's hands in terms of issuing poor performance ratings. This all falls back on the SES senior-level leadership, which is why something needs to be done, and done quickly. Employees should not be granted "step increases" automatically - managers should have to justify these pay increases. Our hiring practices are horrible, and the antiquated nature of our hiring policies forces managers to hire people who are not the best qualified. Once in the government, they simply take up space and resources for the next 30+ years. EPA does not value educational credentials.
319	Adopt the culture of continuous process improvement that Lean can bring to EPA. Once a process is improved in one part of the organization, it should be mandated to the whole Agency to adopt the new process (unless they can prove they can do it better).

AMERICAN OVERSIGHT

320	319	5/3/2017					We need to modernize our e-discovery technology. The current resource constraints and old versions of software place us years behind common industry standards. The result is more person-hours spent reviewing documents to respond to litigation, congressional, and FOIA requests than is necessary. For example, if we were able to "thread" emails (organize a chain of emails so that it only needs to be reviewed once rather than in each iteration of the chain), I estimate we would save at least 1/3 of the time an average document reviewer spends on these projects. That can be hundreds or thousands of hours on some of our larger projects. My office is told that we don't have enough server space to accomplish this. Our	
321	320	5/3/2017	EJ Screening and Next Gen Permitting. Although I recognize the importance of overburden communities in our decision-making process, this process is time consuming. We are required to perform tasks that are beyond our role in order to comply with EJ screening and Next Gen guidelines. This is causing work backlog and unnecessary delays in issuing orders and permits. I think, regulations offer enough guidelines to deal with communities and any effort beyond that should be done on a case-by-case basis.	Better communication, clear and achievable MOU/MOA and using a strategic-decision making framework involving all these partners. This would help determine what are the needs for each partner and what are their respective priorities and resources available to address them. This would help move things faster and achieve results in a shorter timeframe.	Accountability, regular meeting/roundtables/workshops to discuss challenges, achievements and products. Also, revisit established strategies to find out where improvements or disinvestments are needed.			I think establishing agreements and annual planning of the tasks that will be performed by either EPA and States, in order to avoid overlap and duplication of efforts. It is important to make sure the States comply with federal requirements in order to work together (e.g. credentials). Also, resources need to be reevaluated each year to make sure the work can be accomplished.

322	321	5/3/2017	The scourge of all government agencies: too many meetings (and too much training!). The solution? Best to consolidate meetings into scheduled updates, and all training to an online delivery system.	That they continue to rely in the Agency's expertise in these matters. After all, is it not the EPA the subject-matter expert when it comes to protect human health and the environment by writing and enforcing regulations based on laws passed by Congress?	Continue to foster the relationships with these stakeholders, where face-to-face interaction would be the best approach to maximize them. Unfortunately, with so many cutbacks annihilating any sort of travel, this likely will not be plausible.	Let us get through VERA/VSIPs, RIFs, and accompanying budget cuts proposed by the Executive first, and then we can see what we can cut from the remains of the Agency.	No suggestions at the moment.	I do not have any suggestions at the moment, except point out that in paper, it is on paper, it is an attractive idea to "realign" shared agency responsibilities with others, but at the end, after all the reorganization, a subject-matter expert must continue to exist who can provide final and authoritative answers to very hard and specific questions. Agencies with "shared-responsibilities" who try to undertake this challenge, are often bogged down when they do not know what their appropriate roles are after being consolidated.
323	322	5/3/2017	I had a FOIA request that took over a month to be assigned to me, even though the requester put my name and email address in the text of the request itself. I responded within a week once it was in my control, but the requester was already annoyed.		Establishing awards for customer service in non-HR jobs. The current customer service awards always go to the people who serve EPA staff (FCOs, HR officials, etc.). Make a special category for excellent customer service to phone calls and emails from random members of the public, they are the hardest to prioritize, and the easiest to ignore.	Stop all the fear-mongering over our budget. The emotional toll it takes on our employees drives away dedicated civil servants. Getting asked if you're going to lose your job by your friends and parents every day is exhausting. Reward hard working early career staff. They get paid the least (would REALLY appreciate monetary awards) and they are working to build a good reputation (would really appreciate the public recognition). Continue to push honest PARS evaluations with constructive feedback. Punish workers with low productivity.

328	327	5/3/2017	I don't really have any complaints in this arena. Too many emails probably.	Changes in presidential administration should not automatically lead to a reversal on every single policy of the prior administration. This whipsaw effect is horrible for predictability and certainty among stakeholders. The complete 180 on every policy of the Obama Administration, simply because it was the Obama Administration, is juvenile and un-informed. I have had conversations with industry who are flabbergasted by some of the announcements of rules that are going to be reconsidered (like MATS and the steam electric ELGs). There are already huge investments in compliance technology that are happening or have happened, that are being undermined by the Pruitt Administration. When these companies go to recover costs before their PUCs or PSCs, they are now at risk of findings of imprudent investment. The Pruitt	Creating, fostering, and encouraging a culture that it is OK to communicate with outside parties. Too often, frank and needed discussions with stakeholders are held up by managers' sense of need to "control the message." While this is appropriate and needed in some contexts, in many others, staff may feel unnecessarily stifled from having productive conversations outside the agency out of fear, sometimes vague and unfounded, that it will be disapproved.	Yes, a new political administration that takes the mission of the agency seriously. Hiring up so that we have all the FTE that we need to do our jobs. Implementing the statutes on time and in good faith. Providing certainty to stakeholders. Embracing sustainability and GHG-reduction as a voluntary effort in the private sector, which even the Bush Administration was capable of. Understanding the science, and allowing it to inform policy, rather than denying it. Gosh, the list goes on....	Going electronic with most filings - but this was already happening in the prior administration.	Giving staff the room to work with their counterparts to come up with pragmatic solutions. Politicizing these interactions is often unnecessary and happens too frequently. The need to elevate an issue can be important in order to resolve a dispute. But when staff don't feel they have the authority to resolve even minor differences, the process gets bogged down.
329	328	5/3/2017	1. We need to plan for a multi year budget. 3 years minimum. Seems impossible but the organization cannot run with out a three year plan 2. EPA strategy MUST be tied to Human Resources and Equipment/Admin resources (travel budget, field gear, vehicles, computers, office space). Previous EPA strategies are not tied to HR and Facility capacities/needs 3. Outside of Superfund, none of the core programs utilize workload models. This is a must. There is no way for management to plan or attempt to meet goals without knowing how much work certain employees can do. Superfund has a workload model due to its inherent need to bill work hours against the trust fund. Core programs are not doing this, so you cannot answer basic question like how many POTW CWA inspections can a single inspector due in a year? How much travel will the inspector need? How much equipment do they need . . . . W/O this information the programs cannot plan for or explain how they will meet the goals within a	Contrary to some of the current discussion, you cannot create partnerships with the States and local communities nor the private sector from Washington D.C. nor in some cases a very centralized Regional Office. The brownfields and superfund programs have the best models for how to work closely with private industry, States, and local governments. They put their employees in the fields in field offices or directly in State or Local offices. The close proximity has paid off in huge efficiencies and project successes. Region 10 has a excellent set up with field offices in each state that are staffed by the programs from the Seattle Region 10 Office based on the needs of the State. For example Oregon has a lot of air quality issues from wood burning stoves. So Region 10's Office staffs an Air person in the EPA Oregon Field Office with expertise in wood burning stove air quality	See answer to Q2. Also supporting more IPAs where EPA programmatic people server 2 or more years working at and with our local and state partnerships has proven incredibly cost efficient and effective. See work done in Milwaukee, Cleveland, Chicago, Detroit . . . The brownfields Program has experience with IPAs but other programs have also utilized the tool.

330	329	5/3/2017	Collection of documents for FOIA, congressionals, and e-Discovery is a painful process in the agency because of a resource issue. Issuance of litigation holds is also painful because, in my opinion, we purchased the wrong software. I think with all software solutions we seem unable to choose something that is user friendly because we are being penny wise and pound foolish. You need to put someone in charge of the process that understands both hardware and software, and who also understands the legal requirements related to both defensive and affirmative litigation. This person or couple of people need to be able to communicate with the legal and IT communities and need to be able to make decisions that affect both the legal and IT processes at the Agency.	We should be able to speak to get a list from the states, municipalities, and communities about things they feel they need help with, and then work on those matters with the state.		Travel authorizations for no cost TA's should be easier to process. Employees should be able to make changes to leave in peopleplus and then have the supervisor approve. Right now they have to contact the supervisor who has to go in and cancel for them, and then reapprove, wasting lots of time. There should be more flexibility with the work at home days. People should be approved for X number of days per pay period and use them in the best way possible to allow flexibility for everyone without having to reapprove many times along the way. An email to a supervisor should be enough letting the supervisor know that they		Wetlands enforcement should be done either by the Corps of Engineers or by EPA.
331	330	5/3/2017	The review process for reports seems arbitrary and tedious at times. I would give each level of review a clear and communicated purpose so that reviewers aren't making comments that need to be addressed simply because they feel no comments mean they're not doing their job.	By focusing on the environment and taking scientific research into account when conducting audits and issuing recommendations. This includes climate change, air quality, and clean water findings whose application are essential to protect human health and the environment.	We would need to assure them that the Environmental Protection Agency is actually there to protect the environment. By simply stating that it will come from promoting business doesn't say anything substantial or even logical about how that would be achieved. I think if we had a mission more applicable to the goals Richard Nixon founded the EPA on, mainly protecting the environment, than states, tribes, and the community would have more confidence in our work.	I think that we're already stretched too thin.	None that I'm aware of.	I'm unaware of any other federal agency that performs the same functions as the EPA. The idea of realigning activities with another agency just for the sake of doing it seems as if it would dilute our mission and just be an inefficient bureaucratic move to make it look like we're streamlining and creating efficiencies when that isn't actually happening.

AMERICAN OVERSIGHT

	I

334	333	5/3/2017	The onboarding process for new hires (FTE/grantees/contractors) needs to be streamlined and improved. New hires often start working without a computer, an Epass badge, or even a desk, which means that they can't start working properly for some time. Additionally, new hires don't get important information that could help them do their jobs efficiently. For example, it takes people a long time to learn the organizational structures of offices, people's names and what their duties are, who to ask for certain questions, where things are located in the building, what important acronyms means, etc. Some offices have better onboarding protocols than others. I think the process should be standardized across all offices/labs/divisions. I would suggest a new hire checklist that would require new hires to meet each member of their division/office/lab and briefly chat with them to understand who each person is and what their role is. Additionally, it would be extremely helpful if every staff member at EPA had an online profile on	More integration of social scientists into programs and projects could help facilitate community engagement and make sure that our work addresses the needs of stakeholder groups. If the community is an active participant in our projects, and feels that their concerns have been respectfully incorporated into our programs, they will have more trust in the EPA. I believe that better participatory regulation and citizen science, coupled with improved trust, will lead to better compliance to regulation and better environmental results.	I think good customer service begins with good communication. If we improve our communication, make it easier for stakeholders to contact us and interact with us, it could improve customer service. I think another part of this is increasing our public communication with the media - getting our message out to the public more. Many people do not know all the things that the EPA does besides just regulation. We need to get that message out more, inform people about the amazing research we do and how we work with communities.	One way to reduce costs would be to allow grantees/contractors to have flexible work schedules and telework opportunities, like FTEs already have. It's been proven that people are more efficient workers if they have flexible work schedules and can work from home a few days a week. This also improves worker morale which in turn improves productivity and efficiency. Overall, I think this would be an easy way to cut operating costs if people are teleworking more.	All our facilities should use 100% Green energy and have recycling and composting. Water efficient toilets should be installed in all locations to help conserve water and all water infrastructure should be upgraded. I know in some locations, the drinking water coming from the water fountains is unsafe or unpalatable to drink (due to old pipes) and water coolers are in use. This is ridiculous considering that we are a public health agency! How can we expect the public to make efficient technology changes to their homes and businesses if we don't do it in our own offices? I think every EPA office should serve as a model for energy efficient infrastructure so the public can visit and see how great it is.	I think this boils down to better communication between agencies about what their missions are, what projects they have going, and what research they are funding. We shouldn't all be spending money on doing the same thing, we should share more data, collaborate on more projects, and reward sharing of resources and information.
335	334	5/3/2017	Please fully fund the IT project that the Office of Ground Water and Drinking Water is developing called SDWIS Prime. Implementing the Revised Total Coliform Rule with a computer database that is not set up for the rule is very difficult.	Fund travel dollars for EPA Regions and HQ to be able to go onsite to States and work together in person. So many potential misunderstandings can be solved by simply being in the room together and putting a face with a name. Bringing people together to work together is what it is all about. Fund EPA staff to go out to do trainings for states. Webinars do not serve all purposes. Many times people are letting the webinar run while doing something else and not paying attention. In person training works much better.	Fund travel dollars for EPA Regions and HQ to be able to go onsite to States and work together in person. So many potential misunderstandings can be solved by simply being in the room together and putting a face with a name. Bringing people together to work together is what it is all about. Fund EPA staff to go out to do trainings for states. Webinars do not serve all purposes. Many times people are letting the webinar run while doing something else and not paying attention. In person training works much better.	No. EPA is so cash strapped and the hostile climate of the Administration towards the employees make things even harder. Defunding staff and calling it an improved efficiency is not ok and will only hurt environmental protection for future generations.	Funding SDWIS Prime (in OGWDW) would help states and regional Direct Implementation programs a lot!	realigning activities in areas of shared responsibility and mutual interest with other federal agencies would end in disaster. Most likely the primary agency left with the responsibility would ignore the nuanced differences of the agency from which it was taken away from. For instance, if environmental emergency response were taken away form EPA and left only at FEMA then they would not have the expertise or focus on helping water systems come back on line after a flood or similar disaster. EPA has heard from ASDWA and ECOS and other organizations

336	335	5/3/2017	We create "blue folders" for every regulatory action that comes out of our division. That blue folder contains a communication plan, fact sheet (that is later uploaded to the website for the rule), action memo to the Administrator that describes the action, and a printed copy of the FR notice. These printed copies are then reviewed and comments/edits are made in writing on these which then are returned to the rule lead for them to incorporate into the electronic file. The hard copies are then sent to the recycle bin. With the technology and file sharing capabilities we have today, having these printed copies is a waste of resources. Not only is it a waste of paper (something that we should be limiting given our work), but a waste of time with having to go back to incorporate comments that could have been added via track changes electronically. We should eliminate using hard copies where appropriate and encourage senior levels to review electronic files to ease the review process and avoid additional holdups	In the projects I am on, we already work closely with these groups. I think there is a misconception from the new administration that EPA was going rouge and out to get industry. It doesn't help that so far the administration has had minimal contact with staff level employees that work day in and day out on regulations and work with these outside groups. Just this week I have meet with 3 industry groups on one particular rule, I have met with representatives from several states on another rule, and I have been working for the past 2 years with municipalities to ensure that the regulation I am working on does not cause unnecessary burden. Coming in with the assumptions about how we work and not taking the time to speak directly with the staff has put this administration at a great disadvantage and has prevented it from learning how much we	I think we are doing this already. My only suggestion is to have this administration stop attacking the staff and the efforts that we have put in simply because their political agenda is different from previous administrations. There is a lack of understanding that work we did under the previous administration was at the direction of political appointees (like yourself) and not at the discretion of the career level staff. We as public servants take the brunt of the blame for the actions of the political agendas of whomever is running the country. Even when we do not agree (and we actively voice our disagreement) we are ultimately forced to move forward with regulations that may not always make sense simply because of the political motivations of those in charge. But make no mistake, this new administration is doing the exact same thing that previous administrations has done. The biggest difference here is this	See my response to Q1.		
337	336	5/3/2017	Wide use of contractors to perform EPA work - inefficient and often ineffective - solution: hire more EPA FTE to do the jobs right the first time Obsolete equipment and software - limits productivity of staff - solution: provide more current and available hardware and software	Empower and staff the Regional offices to work more closely with the states, etc. Use Chesapeake Bay Program (partnership of EPA and 7 states) Restoration efforts as model for other watershed/landscape problems; Chesapeake has shown success by combining federal and state resources devoted to collecting and assessing environmental data; collaborative decision making and accountability provided by EPA	See Chesapeake Bay Program example above: put in more resources devoted to solve a widespread problem in a collaborative framework. Bring back the construction grants program to support rebuilding the crumbling drinking water and waste water infrastructure; the original CWA program (1970s and 1980s) was very successful and cost effective in achieving its mission	My perspective is that EPA does not now have the resources necessary to carry out its Congressionally mandated mission to protect human health and the environment; Increase support for state environemental program while maintaining a robust and active EPA accountability and oversight	Stop changing the travel, personnel and other cost accounting contractors every 1-3 years - hire more EPA FTE to build and maintain these basic human resource functions Harmonize the data collection/storage and keep the data publicly accessible (including climate change data)	EPA already partners with many federal agencies and states in accomplishing our mission. Continue to provide resources to empower both federal and state staff communication, data Continue to collect water and air quality monitoring data and making that publicly accessible (including restoring all climate change data); transparency of information helps EPA, other agencies and the public advance the environmental mission

338	337	5/3/2017			Centralize web content services and support so that customers get better web communications from us	Centralize web services and support to reduce inefficiencies. We have zillions of people each spending 10% of their time on web. Makes no sense.		
339	338	5/3/2017	Inappropriate political influence, too many upper management layers and inadequate staff that are the result of ill-conceived recent hiring and internal transfer limitations adversely affecting the ability to get the work required by law done in timely manner.	Insure strong federal oversight and support since states, tribes, local communities, the regulated community, and the public (despite what is assumed) do not have the ability to address cross-jurisdictional issues such as downstream or downwind impacts as the EPA does.	Provide adequate staffing/funding for all programs. Otherwise, it erodes the ability of EPA and individual staff to provide the very support states, tribes, local communities, the regulated community, and the public deserve and depend on. Keep the for profit political bend out of science-based decision making if the administration really wants to be even handed and provide better service for the public at large.	Reduce the dependence on contractors. While difficult to quantify because most agencies do not make "widgets," unlike a business. A federal agency like EPA does not work for profit, but for the benefit of the public and environment. Keep politicians and business people out of science driven agencies as it distorts the performance of those agencies and causes higher cost and inefficiencies.	Simply adopting a new technologies or processes will NOT make us more efficient, effective, or accountable. It cannot be done without a revamping of the entire IT structure, from replacing old outdated hardware, software, security and inadequate support and training that would enable staff to get work done as efficiently and as effectively as possible.	Those agencies where EPA has specific shared responsibility are limited given current law. Where those responsibilities overlap, most agencies, particularly at the regional level, tend to work closely on their own, utilizing their separate authorities in an effort to protect public health and the environment. Keep political and big money influences out and there would be even more cooperation. A realignment of agency responsibilities - their actual authorization statutes and core requirements is only something only Congress can do.
340	339	5/3/2017	I have to fill out a form to go to the bathroom at EPA. Notifying the state of a inspection is a waste of time. When I go on an inspection I have already talked to the state inspector and his/hers supervisor to get back ground information. Also, the state inspectors always attend the inspection with EPA. Most, if not all of my inspection are at the request of the state, so what is the point of notifying the state when they already know of the inspection and have approved it.	the best way to improve water quality is to conduct sanitary sewer inspection of WWTP's collection system of medium to small wastewater treatment plants. The small WWTPs either do not report sanitary sewer overflows to the state or they are not aware of the overflows. SSO inspection of a collection systems can identify ways wastewater systems can improve practices and O&M to prevent SSOs.	EPA and state inspectors need to go into the field together more often to conduct inspection. This will improve communication between the state and EPA. Also, its a good way to exchange ideas and work together.

341	340	5/3/2017		Strengthening EPA's connection to the private sector should be an agency priority, whether it be small businesses or American multinational corporations. Environmental education should not just focus on youth, but also serve businesses. EPA should work with environmental offices in Department of Commerce to engage the private sector. EPA's international efforts should also include a private sector component as business is increasingly global.			Encourage EPA staff and all government agencies to use less paper. Lead by example.	EPA should improve its engagement of military and veterans.
342	341	5/3/2017		EPA has enormous, excellent data systems underlying all our programs. We can use these in a more coordinated fashion. For instance, any staffer visiting a facility (for enforcement, informational visit, permitting, etc) should be able to go online, enter a facility ID, and quickly generate a comprehensive summary of the facility's environmental data -- TRI reports, water and air permits, hazardous waste status, compliance history, etc. Envirofacts gets us part way there, but the process should be as easy as using Google, and should be a routine part of every site visit we are involved in.	Citizens need EPA to be an effective ombudsman when they have unresolved environmental problems in their communities. There should be a simple 'complaints' process (toll free #, online form) that does much more than result in a message for the person to contact their local authorities. We should be actively engaged in solving problems, coordinating other agencies (federal, regional, state and local) as appropriate, and seeing the process through until a situation is resolved or an explicit decision is made that no action is called for. This would have been valuable to have in place for, eg, the Flint water crisis.			
343	342	5/3/2017	When I was first hired it took months for EPA to issue me the correct high performing computer I needed to start my job and learn about the work I was doing. It was beyond my control and the control of my manager. It has something to do with the way EZtech manages things.	Having them at the table for discussions is best. I have seen people from other agencies in other states come to work at the EPA on details. That kind of thing can be helpful and bring specific perspectives on local issues people may not be aware on the federal level in DC.			I think the EPA should be embracing new technologies, even crowd sourcing for some activities we do.

344	343	5/3/2017	I believe that policies and procedures governing record retention and storage, primarily storage and destruction at the appropriate end of record life cycle should be looked into. It seems no one person knows what to do at the end of record cycle stage, including shredding of ordinary and sensitive information. There is ambiguity on where to send them and at what point in time -- I believe this is because the policies seem disjointed such that a complete picture of what to do does not come together. The travel system and policies of recent months has resulted in a great deal of confusion and unnecessary changes. Perhaps it is "changes by exception" rather than what generally should exist. Every office should have two persons who handle the administrative responsibilities for travel requests and vouchering, training requests and vouchering, and records administration at the base level (not high level or in addition to the higher polity level). This is because few employees travel all the time and changes occur in between	Adding benchmarks to the equation. As of now, in at least some areas, the process of benchmarking is absent. There is the presence of goals, outcome, outputs, and activities used to determine results but the benchmarking of these actions and activities to aid in determining or measuring interim progress with these environmental partners is absent from policy.	Holding these partners results accountable without unnecessary oversight just for the sake of justifying roles. Ensure that assistance "funds" are being granted to organizations and entities for a true public purpose by "reviewing the policy definition of such and the practice."	Look into levels of oversight. In some areas it may be excessive or these multiple levels have served its purpose on a situation that has now been remediated or resolved. However, companies should be held accountable because if no one is watching they will pollute excessively and quite often without concern for the dangers to the surrounding communities. Focus oversight on states excessively friendly to the types of industries that might pollute waters, ground, and air.	It is my understanding from the ISO at several levels in our AA ship (top level included) that the network drives are not set up to handle CBI. This is astonishing to me. I had been using the I drive because it had been previously communicated by both the division director at that time and the office ISO that the I drive could be used for that type of information. However, now we are being told that it should not be and that these files should be removed. I am reluctant to delete these files although I have been given a secure thumb drive to put these files on. I have copied these files to this thumb drive but I do not feel comfortable deleting files from the I drive. The agency should ensure there is at least one drive for	This concept is an interesting one. It sounds similar to the shared service center concept and the sharing for payroll entities. I feel certain this could be accomplished for the purpose of environmental protection. The agencies that come to mind that are similar to EPA or at least some areas are similar, include Depts of Interior and Agriculture and the Corps of Engineer, and in come cases Dept. of Energy.
345	344	5/3/2017	Fear of losing my job because laboratory leases are not being renewed and there has been no word if the laboratory will be moved to another location or if employees will be transferred to another location.	Continued work with our state, tribes, local government and the private sector is very important. We work for the American people. More outreach to state, tribes, local government and the private sector is a must. This is done by meeting with our counterparts on a monthly or quarterly basis. The meeting should be a casual event and not to discuss work, but to meet with one and other and to see each other as people first.	Outreach to the community is also very important. The American people need to understand that no matter what our political views are they should play no part in keeping all communities safe from pollution.		yes, use the talent within the employees of the EPA. 347	346	5/3/2017	Too much overlap from the HR and Program Analysts in the Regions and AA's with the SSCs (Shared Service Centers). These positions in the Regions and AAs should be reviewed and recommend elimination as they are duplicative.	Reduce so many burdensome regulations and programs	Reduce so many burdensome regulations and programs	Yes - we have too many regional offices and administrative functions being performed by too many offices. Why do we need so many Regions? (for example NY, Boston, and Philadelphia are driving distance to each other; why have all three? Eliminating two or three Regions would help and consolidate into another Region. Allow the SSC's to perform the HR functions and consider consolidating other admin functions to these three locations - goal: three administrative service centers which will reduce administrative functions in so many offices.	Get rid of PeoplePlus for timekeeping purposes and utilize the IBC System for timekeeping	Eliminate and consolidate two to three Regions; consolidate more admin functions to RTP, Cincinnati, and Las Vegas; reduce the number of Program Analysts performing HR functions; and there are too many Environmental Protection Specialist positions with overlapping work and functions.
348	347	5/3/2017						I believe that a centralized procurement office would benefit the EPA. All the major contracts could be procured/maintained at headquarters and simplified acquisitions procured in the regions. Expand the headquarters contract office and reduce the regional contract offices.
349	348	5/3/2017	It would be beneficial to have electronic concurrences for all letter routing.		I would like to see a strategic effort to identify opportunities to consolidate digital data base infrastructures for better ease of use for internal stakeholders and better service delivery for external stakeholders. The power of data base management is key to a full functioning and effective organization, but without proper investment it can be difficult to achieve desired results.		FACTtool is a new software product that allows for better reporting and maintenance of financial assurance instruments by streamlining and centralizing the data involved. The more regions that utilize this tool, the more effectiveness gained.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
350	349	5/3/2017	The Information Collection Request (ICR) requirements sometimes inhibit or prevent us from maximizing our interactions with the state environmental agencies and from gathering information that the public requests.		We should bring back the RCRA Hotline, which was a free service that provided answers about the regulations to thousands of callers each month.		We need to invest more widely in webcasting technology so that we can provide training more efficiently and effectively to our stakeholders. This would save money by reducing travel to off-site training locations.	
351	350	5/3/2017	We do not have enough administrative support help. Having to do administrative work (e.g., managing files, emails, document reviews) takes away from the work I was hired to do and is way more costly because someone with a lower pay grade can do the administrative work. This is especially true for discovery in litigation and FOIA responses. We should have several FTEs solely devoted to responding to FOIA requests and discovery.	States, by a long shot, do not have the resources to carry out all of their responsibilities nor their responsibilities well. They often try to skirt legal requirements in an effort to reduce their workload or to create efficiencies. The statutes are flexible in some areas and not in others. We see this all too often. As such, EPA's oversight role is extremely important. EPA's assistance to States is essential. EPA's enforcement authority where a state fails to enforce is paramount with respect to protecting public health. EPA must maintain a strong oversight role with States. Also, given EPA's paramount roles and responsibilities including State oversight and assistance, there should be more of an EPA presence locally than less, as such, eliminating/consolidating EPA offices/regions/labs will result in worse environmental results.	EPA needs to a much better job educating all stakeholders, particularly the public at large, about what the Agency does, the benefits of Agency actions, the risks of Agency inaction, and the role we play vis-?Â -vis the states, tribes and the regulated community. When our budget is cut, public relations and public educations programs are often times the first to get cut. Without a proper understanding of EPA's extremely important roles and responsibilities, the public and others are not informed or misinformed as a result of misinformation from EPA skeptics. I have supported EPA management's testimony on Capital Hill and have watched Congressmen ask EPA managers questions only to walk out of the room and not listen to the answer. If EPA cannot have an avenue to educate the public, the Congress, the regulated community, and all other stakeholders, it is very difficult for the Agency to effectively and efficiently carry out its duties.	We can barely pay for our paper and pens. This is not an exaggeration. Our budget has been persistently reduced for the past several years. Our current budget, let alone the cuts the Trump Administration proposed for EPA in FY 2018, is not enough for the Agency to properly protect public health and the environment. Reducing costs will only contribute further to our lack of resources which will in turn, prevent us from adequately protecting public health and the environment. Also, given EPA's paramount roles and responsibilities including State oversight and assistance, there should be more of an EPA presence locally than less, as such, eliminating/consolidating EPA offices/regions/labs will result in worse inefficiencies	EPA's roles and responsibilities should be well known to all stakeholders and the public at large. They are not. I am often asked about this from both Democrats and Republicans. As such, we should use appropriate technologies to get the word out on a regular basis with respect to the Agency's roles and responsibilities as well as the Agency's achievements, benefits from those achievements and the risks of Agency inaction. This should be accomplished through avenues additional to social media as EPA skeptics/opponents do not follow EPA on Twitter/Facebook, etc. Joking aside, EPA should run ads on FOX News and other conservative networks/media.	There needs to be a robust national EPA with distinct authorities and responsibilities from those of other Federal Agencies and States. EPA's expertise is needed to set public health standards that are federal floors to prevent a race to the bottom by States. EPA's oversight role must be robust and distinct as well as the statutes for which we derive our authority are highly complex and specialized such that EPA's experts are essential to proper implementation and enforcement of those statutes. EPA should have more resources to assist and educate states with the implementation of these highly complex

352	351	5/3/2017	I spend too much time with employee onboarding/exiting the facility, and navigating forms and processes for travel (Concur), spending (PRs), and training. These are all administrative functions that have been pushed onto the staff and prevent us from getting to our job. The inefficiencies are substantial, because we touch these systems infrequently enough that we consistently get the forms incorrect, and the job takes twice as long (or more) than it would take someone whose job it is to routinely work with these systems. To address this, I would hire more administrative support staff. We also spend a great deal of time routinely training new term staff. While the FTEs at our facility have declined by ca. 33% over the past 10 years, we actually have about the same number of staff working to complete the same or more work. The difference is that a large portion of our staff are term employees, and maintaining their associated contracts and training them requires	Where we seem to do well is where we have long-term relationships build on credibility and trust. Conversely, where we do poorly seems to be where our operating mode is to help in a reactive manner, and leave when the job is done. We should use ECOS more to establish firm times (EPA liaisons?) between the states and EPA.	Similar answer to Q2. In that context, we can use forums (such as ECOS) with these organizations to gather information on what they perceive are their biggest needs. For example, I have been active with the EPA AOC meeting, and a concern the local communities and states presented to federal partners was the need for help with monitoring and assessment designs and resources. The next step would be to have someone at EPA who is accountable for tracking the request and identifying ways to provide that support.	We have a legacy of an extensive hierarchical structure. Shifting to a more horizontal structure (more people engaged with the work, fewer layers of management) would allow us to increase service and thereby protection. Our IT systems are highly underfunded, but with some investment they could be brought forward to this century to facilitate a more horizontal organization.	See above. We are bogged down by Byzantine purchasing systems and clunky databases. This slows the work. Encouraging more use of shared work platforms would allow greater integration and facilitate efficiencies across different offices and regions.	We serve a unique role in the federal government. I do not perceive much opportunity here.
353	352	5/3/2017	FLEX TIME, compressed schedules, DFS, People Plus... all impede important work and create obstacles to getting things done. If EPA worked like most businesses where EVERYBODY works from 8-5, productivity would soar and there would be no need for TIMEKEEPERS! Some employees are actually at their desk 2 days a week, routinely. Ridiculous when you can never find people you need because they're out of the office.	More informal meetings (including phone conversations) would open up discussions. As it is, any face to face meetings are so rehearsed and controlled to be sure EPA retains control, very little gets accomplished. It's a case of telling them what we want them to know and nothing more.	Stop threatening the public with ridiculous fines for not responding to information requests. Screams BIG BROTHER when you throw the threat of a $54,000 penalty into every PRP letter.	Get rid of nepotism so that other families have a chance to enjoy the benefits of having a federal employee. There are currently at least 6 married couples working in the Superfund Division alone. Not to mention nieces, nephews, sons & daughters. Supervisors sometimes allow married couples to work in the same section (avoiding scrutiny by not using the same names). Most top management has family working at EPA.	All technology is handled by contractors since being technically savvy isn't a requirement for working at the EPA.	Clear lines should be drawn about EPA's role in cleanups. Because our employees don't actually do the work, but rather supervise contractors, it's absurd to charge businesses tens of thousands of dollars for monitoring chemical spills, etc. We have scientists and engineers who do nothing but stand around and watch contractors do the job.

AMERICAN OVERSIGHT

	I
352	I am not aware of any practices with other organizations (I routinely work with staff from USFS, USFWS, NOAA, ACOE, USGS) above and beyond the practices at EPA.
353	Standard work hours for everyone, NO flexiplace, DFS, compressed time; reduce nepotism; actual penalties for being caught sleeping/working out/leaving building for coffee/holding social gatherings DURING WORKING HOURS. Some employees routinely disappear in the afternoons, not being seen again until the next day. Some supervisors are only in the office 2-3 days a week.

356	355	5/3/2017	Concur (The travel software) is not efficient, and although it SEEMS intuitive, when you actually use it, it does things that make no sense. Same for People Plus, which can tell me it's a holiday, but can't just enter that information (or leave slips or.. anything really). our time should be entered automatically, and only changes if we put in a leave slip. Teleworking should be encouraged more, and fewer hurdles set up for it.	I think we do a great job of partnering with States Tribes Local communities and the private sector, and we should continue.	more in-person meetings with all of the above. although video and teleconference meetings can be effective at times, nothing creates the sort of personal connection that a face to face meeting can generate.	improve contract management, in particular the time it takes to get a new contract in place. While this has improved somewhat over the years I have been here, there are still significant delays and inefficiencies in securing the best contract for the job. Competitive bidding is important, but there are times when you know that X contractor is the best for the job based on past experience, and there should be ways to get work started promptly, while still maintaining objectivity in the selection process.	keep more up-to date with technology in general. We are often years behind in terms of latest software versions and hardware.	
357	356	5/3/2017	There is too much emphasis on administrative preferences and not enough on scientific integrity. We have to follow where the science leads to remain credible. Management should have a stronger understanding of the science and new organizational tools like division or office science councils should be developed to bring more realistic scientific goals and directions to the decision making process.	Maintain strong regional presence. The regions are our link between EPA research and state applications. Strengthening capabilities EPA regional offices would be the best way to ensure a strong relationship between EPA and states.	I'm not getting this. We work together with states to protect public health. I think of it as partnering. In my mind better environmental results IS better customer service. Being an effective partner is how we provide customer service????	First we have to ACHIEVE environmental protection! Then we should worry about becoming efficient. Instead we are backsliding, e.g. Flint, Deepwater Horizon, decades of severe health problems for asthmatics in communities with high air pollution, obvious environmental justice issues. Support for solving environmental problems facing our country is woefully inadequate.	Absolutely. These are best taken advantage of by the experts and scientists in the specific fields where advances are occurring. When new technologies open we should be among the first to evaluate and apply them. Where simultaneous advances in dozens of fields create problems in competition for resources, scientists working in those fields should have a strong voice in decision making by elevating leading scientists into decision making positions or through science councils with real authority.	I have had very successful interactions with the National Park Service on air pollution monitoring, National Institute of Standards and Technology for development of analytical standards for air pollution measurement, and National Science Foundation for developing international air pollution research programs. The main problem is that these were too short-lived and resources were inadequate for maintaining more long-term relationships that could have benefited not only both partners but environmental science in general. More environmental literacy

358	357	5/3/2017		Allow the federal government to set stringent, yet sensible, environmentally protective standards as a baseline that all states need to achieve. Do not lift environmental protections and let states engage in a race to the bottom.	Do not stress economic benefits provided to businesses when promoting EPA's actions. EPA's actions are meant to provide environmental protections to the citizens of the United States.			Do not defer to states and businesses, who are trying to maximize profits, when setting environmental standards. Take note of the overwhelming number of commenters that want EPA to continue to fulfill its mission by protecting the environment.
359	358	5/3/2017	Electronic routing system for reviewing and signing off on documents through the concurrence chain which can incorporate/track changes and re-route through the chain rather than individual paper copies and adjustments after each reviewer with multiple printed versions and that way you also don't have to be physically in the office to review and approve of documents.	New York State currently has a back log of permits to issue/modify and could benefit from EPA's assistance in more actively reviewing, updating and modifying these permits.	More outreach to the public regarding how to submit tips/complaints of environmental violations. Send periodic mass mailings to a targeted regulated community regarding requirements which based on enforcement lacks understanding of regulations. Such as MS4 requirements when a municipality has changed administrations or there's a new permit (so every 5 years) and copies of the construction general permit to all newly permitted construction projects in New Jersey (the state doesn't send a copy of the permit to the actual Site, only to the individual filling out the paperwork who may never set foot on site). This will give the regulated community an opportunity to comply with the full scope of their requirements prior to enforcement.	Consolidate databases. We currently use concur, peopleplus, employee express, docket, lotus notes, dates, outlook, NETI, skillport, onedrive, inspector wiki, adobeconnect, ICIS etc. for a variety of overlapping and redundant uses which can be consolidated.	Electronic routing system for reviewing and signing off on documents through the concurrence chain which can incorporate/track changes and re-route through the chain rather than individual paper copies and adjustments after each reviewer with multiple printed versions and that way you also don't have to be physically in the office to review and approve of documents.	We currently have a SNAP list we coordinate with the States, where regulated communities in significant noncompliance get flagged by EPA for EPA involvement and we coordinate with the States enforcement and follow up. This program is effective and useful and should be expanded and should form the basis for EPA enforcement due to the need for escalation. For example, New Jersey posts all inspections and enforcement results for the public, this information is in the process of being carried over into a shared database with EPA: ICIS. Instances where year after year the States

360	359	5/3/2017	There are to many obstacles. HR Liaison positions are redundant and get in the way of the Shared Service Center HR specialists ability to consult and advise managers properly. Information is received third hand from the Liaison office and often not communicated correctly. Position management and classification processes are disjointed. The liaison office is tasked with position management while the SSC does classification. One is needed to perform the other to ensure proper grading of positions within the organization. Signed organizational charts are not available in order to compare to alpha rosters to ensure recruitment requests submitted do not exceed authorized FTE ceilings. Liaison positions are over-graded and redundant.	Not applicable to my position.	Open lines of communication are required with any form of customer service. Providing more on-line resources and involving local communities, states and tribes in the development process will achieve greater results. When people are allowed to participate in the development process they feel a sense of ownership and are often times more willing to work harder to achieve mutually agreeable end results.	Yes. Positions within the agency appear to be over-graded. A consistency review of several key positions within the organization would likely result in the downgrading of positions. The complexity and performance of duties actually performed do not warrant the higher grade. An annual cost savings from salary dollars and administrative costs could then be redistributed into the programs designed to address on-going environmental concerns and threats.	This agency is very paper intensive. Programs with the capability to streamline processes and go paperless are currently available, but not used to their fullest capability. However, the people in charge of oversight for these programs have not been held accountable for deploying all of the components purchased by the agency. By using the systems as they were intended the need for physical records storage could be eliminated. The ability to access raw statistical data would be more easily accommodated, as well as routine audits and spot reviews.	Consolidating and realigning processes could potentially save of overall real estate costs. Utilizing a more "Virtual" approach for positions suited to this type of work would also reduce the need for office space. Many of the field offices are closely situated (Boston, PA, New York- Seattle, San Francisco) they are also located in high locality salary areas. The cost to initially relocate these offices would result in an initial monetary cost to the agency but the overall savings once accomplished would be long lasting. Many of the functions performed by the agency are transient. Centralizing regional offices to places like
361	360	5/3/2017	I recommend getting rid of the level 2 (minimally satisfactory) performance rating. Beyond the fact that the AFGE CBA definition of minimally satisfactory describes performance that we should not tolerate, but are required to as long as the level 2 remains, the AFGE contract requires that PIPs be written to the fully successful level, while the law/regulation requires our PIPs to be written to the lowest acceptable level--in EPA's case the level 2. This causes difficulties in writing the PIPs and in writing performance standards--supervisors must always be able to articulate levels of not great performance, as well as causing confusion and potential difficulty in supporting removal actions based on performance. I also recommend getting rid of PAPs.

362	361	5/3/2017	Being able to collect information from the public is crucial to identifying how EPA should achieve its mission, yet the Information Collection Request (ICR) process at EPA and OMB often prevents or delays EPA staff from collecting the necessary information.	Measuring environmental results over time and space in a systematic and scientifically defensible manner is necessary to determine whether EPA and partners are achieving better environmental results. In addition, past results or ways to report past results seem to have undergone pressure or political influence. EPA and its partners should identify and implement a process to report results that provide scientific information in an accountable way.	The Regional Offices that support customer service seem to be spread to thin, but this is true for EPA staff that is not outward facing as well. A clear way to do so would be to hire additional staff to provide customer service. If EPA is to stay below its current employment level, there are no clear ways to improve customer service without hurting other EPA areas, given how historically small EPA is relative to the US population, economy, and federal budget.	Despite attempts to centralize certain supporting duties (HR, IT, grants, contracts, etc.), there is still a need for primary offices to retain expertise in these areas. In my current office, many generalists end up spending or wasting time trying to work in all of these many areas, as opposed to working directly to maintain environmental protection.	Creating the ability for the regulated community (and EPA partners) to report information electronically is important and should be done, yet it is not sufficient. There will also need to be some incentive to encourage reporting this way (or disincentive to not doing so).	EPA is unable to regulate certain environmental problems (ie, nonpoint source pollution), and does not have the budget to influence preventing these problems through grants to the polluters. Providing a larger budget and visible support from all levels of EPA, and aligning activities in these areas with other federal, interstate, and state partners would help better achieve environmental results in areas where EPA does not have the authority to regulate.
363	362	5/3/2017	The reduction of multi person (>6) person conference lines has created a bottleneck in scheduling conference calls. I have to share a conf line with my BC and five other staff. It makes scheduling next to impossible. We often end up thinking we have scheduled a call only to have another one layer on top and have to cancel. Everyone's time is tight and this pushes the needed call out 3-4 weeks in order to get a clear schedule again. I try to use the six person line as much as possible, but many of my calls are multi-regional and it fills up too quickly.	Working within our statutory authority to craft clear and enforceable regulations with adequate monitoring, recordkeeping and reporting. Working with the partners when confusion arises. Providing compliance assistance and inspector training and using enforcement, when necessary.	I am in OC and my experience with states, tribes, etc and the private sector is that they come to us when they want clarity. I work hard to ensure that I am responsive to their requests, evaluate all angles, and ensure the decision is validated through the regulatory language. My experience is that the partners appreciate this, even if they don't agree with the answer. I also try to be creative in using existing regulatory structure to achieve a win-win, especially when a regulation is old and might not have anticipated an advancement in technology. The best environmental results are achieved when the regulations are clear and understandable; if a site specific application may create confusion it is important that EPA Is transparent, fair and responsive in working towards an answer. No one likes it when we have a real problem at a source and we have to say we can't do that without a rule change. We also work with the state when a	Everyone I work with has defined and important role in the process.	See my comment above about conference lines. Also, we need a drop box for large electronic files. Our server strips .zip files and is limited to 20 MB. I receive large performance test reports that require much creativity and time to receive.	Absolutely we should leverage resources - for example, cross training with BLM inspectors.

AMERICAN OVERSIGHT

	I
362	EPA often hires young staff, and after gaining experience they leave the Agency because they are either disillusioned with the pace or with opportunities for career growth, salary growth. This is an area where EPA can learn from successful private sector organizations. This is true also of highly specialized staff at EPA. EPA should focus attention on retaining staff, by making a difference in the environment at a visible pace, providing monetary bonuses and wages similar to the private sector equivalent, and providing a workplace that is attractive to the best candidates. As Henry Ford demonstrated by implementing "efficiency wages," offering a higher wage to retain and attract
363	We have a great process in our office which tracks formal responses to incoming requests from states and industry. It is easy to use and widely popular. We are currently looking at it through a LEAN event to make it even better. Any tool which creates transparency and streamlines the review process is worthwhile.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
364	363	5/3/2017	The constant requests for compliance screens to ensure environmental awards are not given to entities with compliance problems. Although I think this is a good thing, in times of short resources, it seems a wasteful use of FTE, and certainly not in line with the Agency's core mission. The compliance screens require many people in many programs in all the Regions and states, to first, try to decipher the all but unintelligible list of entities which are to be screened, then take the time to check databases and files to determine compliance status- many man-hours per compliance screen. I would end the awards programs until such time as our core mission needs are met. Companies should understand the value of being good environmental citizens by now, without having to get "gold stars".	More grant money available for projects. This seems to be an extremely efficient use of resources for projects that are important to the community, and builds good will for future endeavors.	Quit taking material down from our website-many entities rely on our information.	Empower the Regions more.	Reduce the time it takes to acquire new hardware and software. Approvals are often done electronically now, so the process should be faster. Often, by the time we receive new hardware or software, they are already obsolete or no longer supported by the manufacturer.	There is not much overlap that I see. Where there is overlap, it seems a meeting of the local staff of the involved agencies would be the most efficient. MOUs and other agreements take way too long for the benefit they achieve.
365	364	5/3/2017	a) The NEPA Policy and Procedures Manual was written in 1984 and needs a complete overhaul. The rating system for NEPA projects is too complicated for project owners to understand and should be simplified so that everyday Americans can understand it. b) Many records officers insist that every piece of correspondence is an official record and must be categorized into a "records schedule." This mandate wastes way too much of the staff's time. If everything is being monitored on the servers and being kept anyway, why should staff waste time categorizing emails between them and coworkers about their plans for the weekend? Please ctrl/alt/delete this mandate. c) In some regions there are 3-4 different timekeeping systems/software a staff member must use to input payroll timekeeping. Here in R7, we have "People Plus" (official); "DFS" for inputting time in and out, and calculating credit time; "Lotus Notes" for asking for	Train our staff to know the difference between law, regulation, guidelines, etc. There are many times I have been at a State meeting and had to explain the difference between EPA policy, CEQ guidelines, and law. A state partner will ask about a project violating a CEQ guideline and I would have to explain that guidelines are guidelines. Do you have a good reason for implementing this decision over another one? Yes? Great! Start building. If they violate a law in their decision, that will be explained and cautioned against, but ultimately it is that agency/state/community's decision. Also explain to new staff that science may be a truth, but if the law permits a certain practice that conflicts with the science, then the law permits it. Don't overreach.	Honestly, the lack of a travel budget to meet our partners in person has been the worst for customer service. It is hard for me to empathize with a voice on the phone. Likewise I cannot see the expressions on ones face to determine if I may have said something that they might disagree with. Also, making sure we travel to meet those people for NEPA Projects is very important. Much of my advice to move a project forward cannot be put into emails or formal letters for fear that the 280 lawyers in Counsel might object. I cannot help a pipeline company navigate the perils of permitting and get the project started, if I have to write formal letters that have to be approved by activist lawyers.	Hire lawyers that know the difference between law and activism; overreach and jurisprudence. Cut back on those that don't get this concept. You have already considered doing this with the scientists and engineers. Lawyers provide counsel. EPA's mission is not to provide counsel for environmental problems, but to act. We need good biologists, chemists and engineers to provide solutions for clean up. Under NEPA, we need those same people to advise lead agencies on their projects so that they won't be sued later on for creating an unhealthy situation. Also, take a look at Regional NEPA staff. In R7 we have three staff for four states. Other Regions have 30.	Under Superfund, we have Emergency Response personnel that are relying on a large airplane that is stationed in Texas to provide air coverage of hazardous spills. This is unacceptable and expensive. Each region could buy 50 UAVs with air monitoring equipment at the price it takes to employ this one aircraft. Have EPA write their UAV Standard Operating Procedures (which were due two years ago and have not been written) and get those UAVs out for emergency responses. DO NOT use them for enforcement purposes! Only employ them for spills and natural disasters. If you need help with writing the SOP and getting FAA approval there are plenty of former military that can help.	There has been a lot of talk about cutting NEPA because it delays projects. NEPA at other federal agencies slows down projects. We have a set timeline in order to comment on a NEPA document (45 days). Recommend consulting other agencies to determine what types of projects to Categorically Exclude from NEPA Review and get it approved by CEQ. Conversely, having the states oversee their own environmental laws would result in states suing the hell out of each other for damages. Even if we screw up (in the case of Flynt, MI) we still provide the fear that we could take back the

AMERICAN OVERSIGHT

	I
364	Not at this time.
365	UAVs to reduce emergency spill response cost (see above). Use electronic signatures on official documents. Lawyers say it is illegal at EPA. Our military uses digital signatures. Again, find dumbass lawyers like this one and fire them. Get electronic signature up and running. This will save paper printing costs, AND it will save on having to contract out a "records center" that stores paper copies at each region. Standardize...standardize...standardize. Stick to the standards. Why does one region have an EJ section of 30 personnel and another has no EJ Section at all? Why would a Region need Endangered Species law

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
366	365	5/3/2017	Don't punish a region for spending less that their budget by cutting their budget for the next year. We should be rewarding regions.	Because diluted bitumen crude has different physical properties that regular crude, it needs a different leak prevention and clean up response that regular crude and therefore should have strict requirements and the local communities should be informed and trained appropriately.	Remove exemption on oil and gas waste Require ground water sampling before and after gas drilling begins. Require oil and gas drillers to recycle their waste water. Require publically accessible CO2 monitoring at power plants. Require site wide output based emission limits of 800 lbs CO2e/MW. Ex: Palmdale Energy Project Retire fossil fuel subsidies and meat and dairy subsidies. Tax carbon.	Take advantage of purchase reward programs to earn points toward discounts on future purchases Paint the Addison facility and the Houston Lab roof white to save on energy costs in the summer. require Low rolling resistance tires on all cars. replace can light bulbs with energy efficient light bulbs. Allow the option to buy nonrefundable plane tickets which can be half the cost of non-refundable. Currently we are only allowed to buy nonrefundable and yet we do not cancel flights nearly enough to justify the added cost. change the dress code to allow for more weather appropriate clothing so we don't have to pay for AC as much. low flow shower heads and	Utilize the video conferencing equipment we already have. We are spending too much money flying to DC all the time when we could just have video conference meetings. GSA has even more sophisticated equipment and have offered to share their meeting rooms with us. We could travel to a GSA office instead of DC.	
367	366	5/3/2017	The EPA's recent removal of climate change information and the reassignment of EPA staff working on climate change is a huge mistake. Climate change is the biggest, current risk to all life on the planet. We know this. We caused it. We can change it. But delaying action and allowing greed (more profits at the expense of the environment) to interfere are the wrong choices. EPA's Administration does a disservice to current and future generations by ignoring and denying climate change. I urge the EPA's Administration to listen to its own experts and follow their advice.	Working with partners is a great idea, but EPA should continue to lead the nation and to set an example for the whole world on how to combat climate change. Ceding our role as a protector of the environment is not an option.	EPA's budget should be expanded and staff should be added. EPA's mission is critically important to the nation and to the whole world.	Removing or retraining leaders who do not understand EPA's science, facts, and mission would greatly increase the efficiency of the agency. Being led by people who do not understand or do not want to understand scientific facts is hugely problematic and a waste of effort when other qualified leaders are available to lead the agency.	Online training and presentations could be used to train leaders who do not yet fully understand EPA's mission and science.	EPA's budget should be expanded and staff should be added to amplify the good and critical work that EPA is capable of doing. This would increase the efficiency of our fight against climate change.

AMERICAN OVERSIGHT

	I
366	Half of the 8th floor is dedicated to storing paper records. This is a waste of rent money. We need to move to digital record keeping.
367	Yes, the EPA's administration should accept and embrace the science behind climate change. If they are unwilling to do so, they should resign and offer their spots to other qualified leaders. The mission of the EPA is more important than one person or one administration or one political party. The good of all US citizens, all world citizens and all life on the planet far outweighs the benefits for a small group of misguided extremists.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
368	367	5/3/2017	National rules written without adequate input and /or adequate consideration of input from Regions, states, the regulated community and the public can hamper our ability to be "nimble" and to appear "in-touch" with our communities. It is important to have BALANCED input from all before making decisions. It is also important to recognize that while it might be desirable for public health protection purposes to move from point "A" to point "F", in many cases it is more "regulatorily sustainable" to move from A to C and then evaluate the results and look for future opportunities to make additional progress, as needed It would be a mistake to conclude that EPA can function best through a centralized, consolidated office in DC/RTP when most of our stakeholders live in a world/culture which is far removed from that environment.	We need to improve our ability to explain complex issues in every day words that our partners, regulated community and public can understand (must be based on the best science available). Science and facts are important and should be given high value. The policy that surrounds them can be flexible but should be well-explained. It is also important to realize that there are many advantages of choosing a simply written rule that maybe only gets 75% reduction on risk/exposure or emissions over a overly complex rule that may claim get 90% reduction. The benefits range from better compliance by the regulated community to simpler explanations for the public and other stakeholders. We "missed the boat" on this choice in a number of areas.	We should focus our conversations on shared goals and complementary skills and resources. Sometimes we can't agree on all issues and that's ok. In those cases, however, it is important for EPA to establish a national regulatory floor so that there is a level playing field and certainty for industry (e.g. all states require element x for each like facility in a multi-state company) and the public (e.g. not matter what state I vacation in, my drinking water meets minimum federal standards). EPA should continue to focus on performance based standards that allow states and industry the flexibility to determine how best to get there.	EPA and all federal agencies are "punished" -not rewarded for managing budgets wisely and building surpluses of unspent appropriations at the end of the fiscal year. So much money could be saved if such behavior was incentivized (business acumen). Also, EPA's management of contracts is also not done as efficiently as possible. We don't always negotiate smart, performance based contracts, hold contractors accountable for poor performance and close out contracts in a timely way. There are also many obstacles to promptly addressing poor performers at EPA which is very costly to the taxpayer.	EPA is behind on electronic records and data management. Updating our approaches would allow us to be more responsive and transparent to FOIA requests and litigation discovery (save huge amounts of staff hours) and would allow our managers to better track progress on active projects through performance dashboards which could pull data from fully supported databases.	In areas where our missions overlap, incentivize managers to develop productive, collaborative relationships and to build cross-agency teams to accomplish common goals with specific timelines.
369	368	5/3/2017	The EAS procurement system is a nightmare. The centralization of procurement meant long delays. 30 year veteran of EPA, ordered >$350K of equipment, and its never been so bad.	Have EPA staff conduct field auditing and get rid of contractors. The contract work is not done at a high professional level, the contractors shift from contract to contract, oversight is a labyrinthine bureaucratic nightmare of memos and work order requests.	This is one aspect we are doing right, in my Region.	Get rid of non legislative programs.		

AMERICAN OVERSIGHT

	I
368	I think my Region does one of the best jobs of working with communities (states, industry, enviros and the public) to understand issues before taking any action. I also believe that our actions are moderated to the extent possible (see Q1 response) to take advantage of common ground rather than to push for extremes. Sometimes, relationships, commitments and incentives are the best approach (e.g. compliance assistance and the "audit policy"). However, there are some situations where nothing short of a firm regulation or enforcement action gets the results which are needed and in those cases, the Agency must act promptly and decisively. Do not underestimate the
369	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
370	369	5/3/2017	Look for opportunities to consolidate functions that are duplicative and flatten the organization to remove unnecessary management layers. Consolidate all mandatory training requirements in one place and make it easy for people to access and take training rather than getting many e-mail messages throughout the year telling you to take different required training. Centralize all administrative functions within each region and nationally to simplify and streamline these functions for employees. IE., Travel, Taining, Awards, FOIAs, IGMS, etc. should be done by a limited number of people rather than having so many high graded staff spending a lot of time performing these administrative tasks.	Utilize Sharepoint sites to collaborate and share information (may require more IT support). Maintain adequate funding levels to supplement state/local environmental programs which historically have had severe funding shortages within their agencies to address environmental concerns of the public.	Improved tools for collaboration such as SharePoint and improved data management systems to share information (requires IT investment). Again maintaining grant funding resources to assist these underfunded state/local programs.	Move to electronics records management and electronic signature concurrences. Invest more heavily in IT technology, support and tools to expedite work processes and move the Agency in the direction of operating a seamless mobile workforce. Drive culture shift from top down to promote mobile workforce environment which will ultimately save time and money. This includes moving towards hoteling of office space in the future (will need Union buy-in).	Electronic records management, Electronic signatures, expanded sharepoint collaboration. (We need to improve on the technology and functionality rights that we purchase with Microsoft Office). Leverage resources across programs to improve on data management and sharing of information.	
371	370	5/3/2017	I would suggest making the telework policy more flexible. I could do some work, make calls, keep up with emails, etc. on the train or at the hospital or even for an hour a day while on vacation. I could call into meetings and keep up with projects more easily while not in the office if telework did not require you to be at a specific approved location. That would be a huge efficiency for people.	We already do a really excellent job of partnering with most stakeholders. We could perhaps do more with the private sector through P3 guidance, but we need more direction on how to do that.	They seem to be most pleased when we visit them in person, so it would help to have more travel dollars for in person meetings rather than less like it is now. They really react well to interpersonal connections and seeing that we made the effort to come to them, visit their projects, see their cities, etc.	Again, more flexible telework policy. It saves the environment through less transportation pollution and saves costs by us not being in the office every day.	We use skype at work intermittently, but I think everyone should be required to sign into it (and we would need better wifi and assistance when it doesn't work). It makes it easy to instant message each other for quick responses and not waste time with phone calls or emails. Also, it would be nice if we could all access work emails

372	371	5/3/2017		Utilizing innovative technology more effectively; e.g. Remote sensors. Reduce the use of paper and create efficiencies using technologically viable solutions, especially for states, local governments, and communities that lack resources.	See Q 2 above.	Standardized technology across the EPA. There are too many EPA information systems that do not communicate with each other; therefore, you cannot - or it makes it difficult to - aggregate data and use it to make informed management or funding decisions.	See above for "technology adoption." Streamline business processes, using Agile and Lean practices, across media by standardizing reporting requirements from states, local government, tribes to the EPA. Processes are different from state to state and region to region.	
373	372	5/3/2017	The tendency to fund purchase card transactions and track them on an individual basis requires a significant amount of time with very little benefit gained. The agency should promote the use of blanket DCNs which is similar to how other agencies fund and code small purchases when they are purchased rather than when they are approved.			We need to continue to aggregate basic services performed by FTE's or contractor's in order to achieve savings. We also need more people who can integrate the functions that deliver a program or product. Program offices struggle to integrate the different administrative functions provided by the Agency. We focus on perfecting the function, while the program struggles to deal with several functions to try to implement a program. For instance, we seem to prefer FTEs to contractors without doing the analysis regarding whether the skills we need are long term or short term skills.	We need better project management and reporting systems that pull data from our multiple systems, so the program managers making decisions have relevant data when making the decision. Our systems aggregate information at a very high level and make it hard to integrate project information kept in multiple functional systems (People plus, EAS, IGMS, Concur, etc.). If decision managers had better project level data, more efficient decisions could be made earlier. The concern is transparency.	Consolidation of functions should continue. It should include simplification as well as consolidation. HR, budget, extramural, etc.

AMERICAN OVERSIGHT

	I
372	Implement a full telework program within the EPA and use better technologies we currently have (MS 365, Skype) so we can more easily accomplish our work regardless of location. Implementing an EPA-wide telework program will increase employee satisfaction, save employees money, time and frustration from commuting, provide a better work-life balance, and reduce costs by eliminating real estate holdings. By reducing our real estate footprint alone will cut costs by millions alone.
373	My understanding is that other agencies use blanket DCNs to fund small dollar level purchases. The driver for EPA to not do this is because budget staff (funds control officers) code agency purchases. In other agencies, the coding is done by the person who initiates the action. Using the funds control officer as a control point at this level drives transactions exponentially and significantly increases the resources necessary to track and fund relatively easy purchases.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
374	373	5/3/2017		EPA needs to be able to provide more funding in terms of grants and loans to these entities.We cannot do that if our budget is cut.		There are many long-term tenured EPA employees who are doing next to nothing and being paid for it. Civil service protections are important, but they go too far, in that we can't seem to fire employees who are wasting taxpayers' money and causing inefficiencies at EPA.		I don't think we have much overlap with other federal agencies and should not be realigned or combined, because the agencies check and balance each other. States and EPA have appropriately separate responsibilities.
375	374	5/3/2017	PURCHASING... when ordering items or consumables, a paper copy is submitted to management, then we have to wait for them to approve it (if they are not in the office we have to wait) then it goes to the back card holder who places the order. This can take a day to a week. The bank card holder will sit on orders until he collects so many of them and them he will place the order. If there is a discrepancy with the order it goes back to the originator and the process is repeated. There should be a common inventory of regular bought items/consumables and an associated vendor with each item. It would be better if there was an electronic way of submitting/approving and ordering items that would be faster, more effective and efficient. The originator should not have to do market research and should not have to find the cheapest pricing for consumable items. There should be some type of log or inventory region wide and for each division where someone can go into and request an item or items that will then	Each region should use a comprehensive data request and reporting tool. Many use LIMS, but I feel the agency should use a specific LIMS system where all data requests and reports would be the same process across the board. Many regions use different systems/software. ORD and the OW should find a more stream line process for approving analytical methods. At the end of the day we need to provide a product to our partners that provide exceptional scientific environmental results. The agency should provide updated guidance's on a routine basis and not every 10+years. The Lab certification guidance needs to be updated and approved to reflect the newer processes, equipment and methods.		We need more working managers/supervisors/team leads and not just those who oversee their employees/teams but those who are actively involved in there section/teams and who can work side by side with their employees.	the purchasing process really each region should be running the same processes and not doing things differently within each division. For example, the LAN network, each lab should be connected and have the same processes within security measures and equipment software programs that allow them to be the same as our own PCs/Laptops at our desks. This would allow scientists to work more efficiently in the lab as they would at their desks. All areas should be or have the same processes, training requests, travel, time keeping.	USGS shares science and the same environmental data. Though USGS has their own methods and protocols, maybe combining methods or having equivalent methods would better align our practices and research.
376	375	5/3/2017	I don't know of any	MY program is voluntary. Partners are rare..	WE do a pretty damn good job at customer service, if I do say so myself.		We could probably find a better travel management program than CONCUR.	I don't think we can do anything more.
377	376	5/3/2017	The most important factor that prevents me from carrying out my job more efficiently and effectively is a presidential administration that is working against protecting human health and the environment. I would address this by asking the top political leadership to resign and be replaced by people committed to the mission of the agency.	This question promotes the lie that we are not already working with states, tribes, local communities or the private sector. To do so more effectively, I would start by dispensing with this lie.	Add staff. Refrain from political attacks on the agency. Provide a good working environment. We can go further by not regarding people simply as customers. We are tasked with ensure the public's rights to clean air, clean water and a healthy and productive environment are upheld, not to sell a product.	I see untapped opportunity to protect human health and the environment. But this survey and this administration are not interested in that.	There are, as always, but since the intent of deploying such technology would so clearly be connected to job cuts at the agency, I have no interest in suggesting any.	"Realigning activities in areas of shared responsibility and mutual interest with other federal agencies or states" sounds like a euphemism for cutting jobs. So if the question is how could we accomplish more by cutting jobs, my answer is we can't.

AMERICAN OVERSIGHT

	I
374	
375	thanks for hearing us out and working with us to continually improve our goals and missions.
376	Not at this time. Sorry!
377	One "best practice" is to remove leaders who actively attempt to dismantle the ability of the organization to carry out its mission.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
378	377	5/3/2017	Printing of files, wastes paper, we should not have to keep paper files but digital files should be enough. Paper files take up too much space and paper.	The EPA should be able to sample air, water and soil with their lab and college labs using the correct qualitative method. Also, the state oversees the prisons wastewater and drinking water. Prisons most likely have trained prisoners running those systems and if they would like to report issues how can they do that?	Some might say travel more but I think digital video meetings are sufficient enough and could be used more often. The capability is the available but it could be used more often.	Less paper files or no mandatory paper files. Too much paper is required. Expertise in house. Do not print any paper but use tablets glow readers to read PDF's. All trainings and workshops should be recorded to be used for others at a later time..Meetings that are recorded should be recorded with a video camera and have great sound and great picture quality, because not everyone in the office can travel to that destination. We have a video man in external affairs lets use him! More good quality film and recording to connect with others.	We should keep the Houston lab and use less contractors just change the location if the lease is not going to be renewed.	Working with other federal agencies is important more planning can be done and promote the use of max.gov. Have quarterly meetings with other federal agencies employees that are in the same area in your agencies funding people, lab employees, and be aware how each federal agencies connect with you and affect one another.
379	378	5/3/2017	It takes a minimum of 3 months to place a work assignment, task order, or delivery order onto an existing contract. This causes slippages in schedules and is inefficient and an inhibitor for completing projects. This time should be reduced to 3 to 6 weeks. Also, after a certain point in June, during the end-of-year auditing period, no new contract vehicles can be added to existing contracts without an extraordinarily high management level approval. This process should be reviewed and re-engineered to be more efficient and effective.	We should cut the amount of funding provided for research grants to academic organizations (universities and colleges) by 60% and transfer those funds to in-house research and development projects. There is no overhead when using in-house scientists and researchers, as their pay and benefits are already paid for, and this will reduce our reliance on grants and contracts to accomplish our research mission.	In our research and development projects, we should develop more research programs based on the community-based participatory research (CBPR) model where scientists and community members work together to design, implement, analyze, document, and present research that is relevant to solving community environmental issues. Good science and relevant science is accomplished through this approach.	Our hiring process is slow and cumbersome, and this prevents us from attracting and retaining highly-skilled research professionals at EPA. The periodic and regular hiring freezes provides uncertainty to potential research candidates, and they respond by accepting job offers in academia, industry, or other federal research and development agencies.	We should upgrade some of the models that have been developed in older programming languages such as FORTRAN to more modern (and supportable) computer programming languages such as C, C++, Java, Javascript, Python, etc. Converting a program from FORTRAN to C or C++ would save approximately 40% of the storage space required for the program and would increase the execution speed of the program by at least an order of magnitude (10 times). Also, there is a large base of capable programmers in these modern languages, making it easier to find in-house staff or contractors who can further modify and develop these programs.	Our Office of Air and Radiation, Office of Water, and Office of Research and Development should work more closely with states and tribes to implement air pollution and water pollution (prevention) programs and strategies. We should work directly with states and tribes, through some sort of working alliance, to develop procedures and processes so that they can properly implement the laws and regulations and statutes relating to both air pollution and water pollution.

AMERICAN OVERSIGHT

	I
378	People often forward their phones from the office to their personal cell phones...Some agencies have their phone connected to their computers so you do not have to forward your phone when you work from home or on travel. The price of plane tickets is more expensive for federal employees....
379	We should develop a standardized approach towards model and software development. At the present time, we have only general software development/model development guidance, and that guidance is not specific and does not incorporate the modern software engineering principals that lead to easier to develop, deploy and maintain software. We could use an approach such as the Capability Maturity Model (CMM) developed by and for the Department of Defense for developing software development capability.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
380	379	5/3/2017		In OPP we've communicated well in the past with all of the partners listed here, including industry. Recently we've moved away from that as a result of complying with senior manager demands to make non-science-based decisions - these senior managers from the previous administration are now mostly gone. To fight this issue, we need current senior managers to take an unbiased view, which I currently do not see. We need to stop making radical left environmental decisions which cost industry money unnecessarily, but we also have to stop pretending real risks don't simply because the fix might be expensive. Bottom line recommendation, be honest in decision making from both perspectives which will bring us back to a point where we were a decade ago when each of these partners had significantly more trust in our decisions, whether	See response to Q.2 and Q.7. A decade or so ago people often disagreed with our decisions, but the decisions were transparent ad clearly science- or benefit-based so there was more trust between EPA and these groups. This has changed over the past 2-3 years dramatically because of radical, scientifically-unsupported decisions made by the Agency. This needs to change to increase trust again. But it has to change in BOTH directions -- don't create un-real risks, don't hide real risks, and be transparent in all decision making what the risk-benefit balance is that drove the decision.	Get rid of redundancy. OCHP, NCEA, OEJ, and consider themselves to be the police of other parts of the Agency - much of their work is duplicative of work done in other program offices, but done from a different perspective / viewpoint where they are not responsible for the consequences of their decisions. I'm not suggesting firing the staff, but am suggesting moving staff as appropriate to other parts of the Agency which will avoid duplicative work, and where they will be held responsible for any decisions they make.	(1) Cross-EPA ability for electronic signatures, (2) Increased required real training rather than fluffy training, e.g., how to use tools such as Excel to its full advantage	As in a previous response, OCHP, NCEA, OEJ work is mostly duplicative with other offices where the real responsibility lies. I suggest phasing out those programs, without firing people unnecessarily, but moving them to different areas where they would be more useful.
381	380	5/3/2017	Honestly, things had been moving pretty smoothly until the transition team came onboard. The additional briefings and approvals needed for what we consider "routine" activities has been quite frustrating and counterproductive to cutting out the "red tape."	Based on my experience and talking with co-workers, State/Tribes/Locals, etc. seem to work well with EPA staff. The problem comes in when Senior management has to make decisions, but can't because of the political gridlock above them.	I work with the money, so delaying the budget (as far as getting one approved) is always my biggest challenge. Grantees can't strategically plan well if they have no figures to base present and future needs on. They really need to know, at least 6 months to a year in advance, how much money we'll have to give them in support of their programs/projects/activities. Working on continuous CRs is not efficient (AT ALL) and the grantees are the ones who suffer the most.	If you want to make cuts to save money in the budget, then we should really be taking advantage f the Telework program. There's no reason why EPA (or any government agency for that matter) should be renting more office space than is absolutely needed to maintain a cohesive staff for that Office/Division/Section. Not only would that save the tax payers money in overhead cost, but it would cut down on sick days, etc. Most of us already work independently and communicate via email or phone - even if the person is only a couple of cubes away.	Yes! Pretty much everything we do is electronic so certain policies requiring us to still maintain paper files and records is somewhat outdated. I understand why having hardcopies is important, but it just adds to the deficit (i.e. storage expenses). Maybe we could have EPA staff start utilizing the existing databases to store electronic records and one entity in HQs could act as the HUB, if you will, to make paper copies and maintain (per the records retention policies) so we don't lose everything in case all electronic devices fail one day. Could help make FOIA's more efficient as well.	The only thing I can speak to is regarding tribes...Instead of having Tribal funds that are allocated for the various individual media (Air, Water, RCRA, etc), EPA staff working on Tribal issues should be located in the Tribal Office and coordinating with the technical staff in the other media. For example, I work with Tribal Air Grants and these funds tend to be an afterthought for the overall program because the States take most of EPA's attention. However, Tribes feel more comfortable working with the Tribal Office, because they make them feel like a priority.

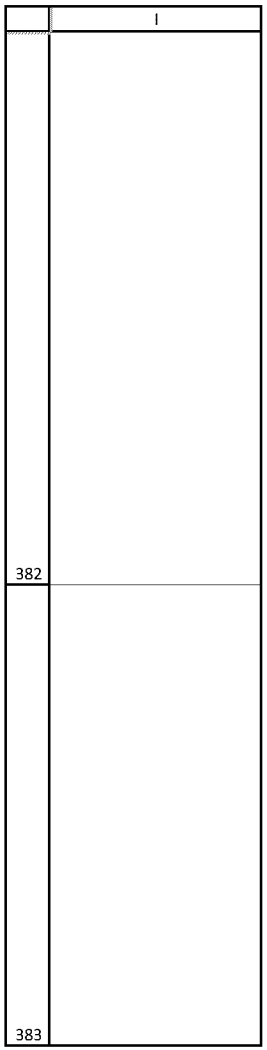
AMERICAN OVERSIGHT

	I
380	Many scientifically unsupportable decisions have been made recently by EPA, mainly driven by senior management from the previous administration who are now gone. However, there are still people who will bend/cherry-pick the science to get answers consistent with their view of how the world should be, as opposed to those supported by the science. This makes us all look bad, when it's really only a few. To minimize this, I suggest that for major chemical decisions (e.g., chlorpyrifos), scientists be allowed to anonymously provide information to decision makers at senior levels which might be different from the party line they're hearing. I think this
381	Please refer to the answers above. If you implemented some of these suggestions appropriately, you could get more staff buy-in to skip a few yearly pay increases (for cost of living) because we'll be able to save money by not having to drive into work (gas & parking money) - not to mention, the travel time wasted going to/from the office. This not only would help cut down on vehicle emissions (which is one of EPA's goals - or used to be) but it would help with staff moral.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
382	381	5/3/2017	The Superfund Records system (SEMS) could be vastly improved for efficiency. Currently it takes a great deal of time to enter a record into the system. In the past before this system came along you could put a cover slip on the document and submit to the records center for entry. Now all the data entry is essentially the responsibility of the Project Manager who are typically at a GS-13 salary. This is not an efficient use of their time. Other electronic systems such as people plus could be improved. Sometimes it take a long time just to submit a leave slip because the data entry is confusing and not straightforward.	I actually believe we have a good working relationship with states, tribes, and local communities.	I think one thing that could help is to offer more training to these entities, particularly in the Superfund Program, so that these groups better understand the CERCLA process and our restrictions and limitations on how funds can be used on cleanups implemented.	I have been in the Region 10 office for over 30 years and I think continuing to maintain a region 10 dive team is a very large cost and not particularly necessary. All told there are probably over 30 people involved in this program, multiple vehicles and boats and state of the art equipment. In addition all these people go through multiple training sessions every year. EPA contracts out nearly all other services of this type so it has never been clear to me why we have EPA personnel conduct this work. Many options exist to contract out this work whenever needed.	None come to mind	
383	382	5/3/2017	There are too many administrative tasks placed on employees that reduce the amount of effective 'real' work time we have. Much of this should be shifted to administrative staff. We also need to find ways to streamline concurrence of documents, delegations. We also have too many electronic tools with too many different passwords that we spend too much time setting, changing, fixing when forgotten, etc. There are too many non-core work related days that pull people off their real function. how much food events should we have? Between internal festivals and appreciation days, we lose weeks of valuable time with no benefit I can see.	Put EPA staff on details to state agencies to better understand how that organization runs.	Get rid of hotlines and let employees speak to the public so we can better understand their complaints and needs.	Get rid of the dead wood. There are people who haven't performed in years, but here they are earning GS 13 salaries. Their lack of performance places a higher workload on others and they make the office an unpleasant place to work.	provide more cell phones. put more AV equipment in rooms so that we aren't having to borrow and relearn how to use projectors, etc.	too many agencies do the same emergency response to the point that we are falling all over each other and can't accomplish a thing.

AMERICAN OVERSIGHT



AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
384	383	5/3/2017	Organizationally, we are fairly streamlined with few obstacles to being able to perform my job efficiently. One thing that could help, being out in the field interacting with responsible parties and contractors is very helpful but often times, our travel budget is too tight. Sr. management seems to be able to travel at will, perhaps at the expense of mid-level people that actually do and oversee day to day operations. This answer is based on continuity of operations as they have existed over the past 20 years. The answer would be significantly different if you were asking me what I would do to make real, lasting change to the agency's operations.	The grants we give to states and tribes can be effective and achieve great results, but, all too often, states and tribes want and pander for the money but, want the money we give them with "no strings attached" or no real accountability from states and tribes for what they do and accomplish with our federal funds. I would make any and all grant funds carry very strict accountability language for states and tribes with measurable outcomes built into the grant language. This includes the State Revolving Funds that often contain millions of unspent dollars. States and Tribes like to "bank" that money for supposed future usage, but, they are largely unaccountable for the money the Federal government has provided them.	For the public, we need to communicate to EPA staff and management that we work for them and not against them. I would make it mandatory that all public phone calls be returned within 24 hours and all written correspondence from the public be replied to within 7 days, even if only to acknowledge receipt of the correspondence and let them know a more detailed response is being prepared. All too often, the public calls or writes to some government staff person, then never hears from them again. This is very poor service.	There are many programs at EPA that truly are a waste of tax payer dollars. If I were to be given full control of the agency, I would prioritize each program (and individual projects) according to immediacy of threat to human life and measurable benefit to carrying out the project. There are programs within the agency that have huge sums of dollars appropriated to them (Superfund and underground storage tanks for example), but that there is no real immediate threat to human life or health by not spending some of those dollars on specific projects. Projects should be evaluated based on how they can alleviate immediate risk to human health or life, how they can alleviate some long term health effect and,	Many cleanup sites should be evaluated based on actual risk, short and long term, to human health and the environment and monies spent on them should be prioritized accordingly. Cleanup sites are like fires that have been smoldering for many years. If a cleanup site has hot flames and poses real and immediate threat to communities, then that site should be given a high priority for funds being spent on it, but, if like most of the cleanup sites, there is only remnant smoke from a flame that once burned hot, but the site poses no real or immediate threat, then that site should be given a lower priority for spending of funds, if any should be spent at all. A risk-based approach should be implemented on all projects.	This is a tough one as each agency or government entity functions as a stand alone business or profit center. Each entity will always act in it's own self preservation interests, similar to how the various branches of the military view one another. If there were some way to make each entity more keenly aware of what things actually cost and make them weigh that cost with actual need, it would help. I do not know how this might be accomplished when the government is set up on these use of lose budgets each year. Managers of agency departments act first in self preservation, so will
385	384	5/3/2017	EPA is a science-based agency with a long history of protecting the environment, while also promoting economic development. EPA has helped reduce air and water pollution significantly over several decades since its creation, while GDP and other economic indicators have grown considerably. Our country enjoys more prosperity AND a cleaner environment in many respects. The toxic political atmosphere and agenda being pushed by the current administration is counter to the EPA's mission and disrespectful of EPA career staff, many of whom are experts in their respective fields. Shifting priorities and uncertainty from management is extremely counterproductive to staff completing their work and providing value for the American taxpayer. The direction and nature of EPA's work should not change with a new political administration or shifting political winds, but rather continue to be based on a firm scientific foundation. EPA officials with extensive scientific backgrounds and credentials	EPA officials with extensive scientific backgrounds and credentials are needed to help provide clear, consistent, and scientifically-based direction to the agency.	EPA officials with extensive scientific backgrounds and credentials are needed to help provide clear, consistent, and scientifically-based direction to the agency.	EPA officials with extensive scientific backgrounds and credentials are needed to help provide clear, consistent, and scientifically-based direction to the agency.	EPA officials with extensive scientific backgrounds and credentials are needed to help provide clear, consistent, and scientifically-based direction to the agency.	EPA officials with extensive scientific backgrounds and credentials are needed to help provide clear, consistent, and scientifically-based direction to the agency.

AMERICAN OVERSIGHT

	I
384	I would start by questioning everything an agency does and get to the root reason for each agency action. I would set up some sort of agency prioritization list of actions based on immediacy of threat and need and appropriate staff and resources accordingly. Many agency programs that have been in existence for decades could probably be put to rest and unfunded as they serve no real public need or public benefit. This sort of prioritization would need to occur across the entire government and all agencies.
385	EPA officials with extensive scientific backgrounds and credentials are needed to help provide clear, consistent, and scientifically-based direction to the agency.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
386	385	5/3/2017	I???m at the top of the GS scale; so, ideally, I should be spending as much of my time as possible producing results for the Agency that match my pay grade. But I spend a lot of time on support services such as scheduling, meeting logistics, document management, records keeping, administrative travel functions, resolving IT issues with computer/phone/video conference equipment, etc. This problem could be resolved by hiring people who specialize in these support services and adequately training them to do their jobs.	Working well with outside parties requires relationship building. We need resources for travel, conferences, and training to build relationships with these parties, exchange ideas, and work together. We also need resources to be responsive to these groups. For example, when a state asks us to streamline our regulations to match the state???s regulations, we need to have the staff on board to do the job. A similar example is that the auto industry gets frustrated with the systems in place for manufacturers to submit data and information about their vehicle fleets, but we don???t have the staff or the contract support to upgrade these systems.	This Administration seems confused about what our core function is. Our core function is to fulfill what Congress has asked us to do by statute. Our core function is to uphold the law. Our core function is to protect public health and the environment. The staff who remain after the budget cuts of the last several years are holding on by the finger nails to fulfill these true core functions. Focusing on small businesses, industry, and states may be great public policy, but we can???t do it without adequate funding. We need the staff and resources to meet our true, core obligations, and then we need additional funding to fulfill these added policy goals of working more closely with states/industry/etc.	Create a more meaningful system of performance review. Reward good performance and create a path to dismissal for poor performance. Do more to attract, maintain, and motivate good employees. Create a culture of accountability. Providing employees with adequate support and resources says, ???You???re a professional. You???re accountable.??Â Not providing adequate support and resources says, ???We won???t even provide you with the most basic tools to do your job,??Â which creates a culture of ambivalence, and doing just the bare minimum	???We need an efficient, user-friendly system for approvals. It???s archaic that we still use paper sign-off packages. Ideally, the system/software would have a process for approval of packages coming up from staff, as well as a process for incoming correspondence from citizens and Congress. ???We need in-house, in-person tech support for videoconferencing and computers. ???Professional staff should be equipped with smart phones. The phone is essential for teleworking ??? without it, we have to use our own personal phones. The phone would make us more responsive (to each other within the Agency and to outside parties). It would enable us to manage email more effectively. It would	We need more transparency about who???s doing what. There should be a searchable federal database that lists all government agencies and offices and what each one does. For example, if I???m working on a project about ship emissions, I should be able to find any other EPA office or federal agency who works on similar issues.
387	386	5/3/2017		Protecting our environment and public health is a complex situation with many stakeholders involved. Greater communication and engagement between all entities (including EPA) is needed. I suggest greater emphasis on multi-stakeholder, collaborative, decision-making to come to better environmental outcomes. These efforts take time and money in terms of meeting capacity, facilitation required, travel funds required, etc.	Good customer service means having a good understanding of what is happening in the field and out in our communities. EPA staff need more travel funds to be on the ground in the communities we serve so we can better understand the public health and environmental issues which our States, Tribes, and local communities face. In addition, having EPA staff interact more often with the regulated public builds trust and can more quickly resolve issues by all-party problem solving. EPA staff could better understand the issues the regulated public faces while the public also could better understand EPA's mission and what our job requires us to do.		Technological advances is incredibly important to getting our job done. EPA staff should have easy access to updated laptops, monitors, easy access to more IT platforms than just Microsoft products, and provide sufficient IT resources so teleworking can be accomplished. Video technology is moving rapidly so communicating more often and with better resources for VTCs internally and with external partners.	

AMERICAN OVERSIGHT

	I
386	???To achieve more of a private sector mentality of efficiency, you have to provide EPA staff with the resources they need to do the job. Set clear goals, and give staff the tools and support they need to get the job done. ???When you strip the agency of staff and resources, you create a culture of ambivalence, and you don???t attract or keep the best talent. ???Give staff the tools needed to do the job. Don???t pay an attorney???s salary to do the job of secretary, legal assistant, janitor, HR specialist, etc.
387	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
388	387	5/3/2017		For emission limit exceedances, state and locals should report the penalties paid per pound of excess emissions into a centralized database for review by EPA. This would help ensure a level playing field across states, and increase accountability to ensure these serious violations are properly addressed.		Better electronic data reporting, particularly for emissions data. I would envision something similar to what was done with the GHG reporting rule, where data was electronically submitted and there were checks for accuracy on the spot (like a facility reporting more than 8760 hours of operation) and other things that were flagged (like using an emission factor outside the normal expected range for that source). This would take a while to implement, but eventually would help streamline reporting and compliance reviews. A system like this should flag reported noncompliance (i.e. emissions reported over the limit) for follow-up by a compliance officer.	Electronic sign-off of official documents (at least through sign-off chain up until the final signatory).	
389	388	5/3/2017	Some contracting service centers administer too many contracts and other contracting service centers administer too few contracts. Let's try to blance the work load.	Let's encourage the private sector to propose solutions to make environmental remediation less expensive.	Encouraging a more open communication environment between stakeholders and EPA employees with expertise in certain program areas.	Yes, lest's reduce our existing office space. We should encourage more EPA employees to work from home more often. This has been done successfully at the General Services Administration. This would reduce each EPA employee's impact on the environment by reducing his/her use of agency resources and decreasing his/her need to travel too and from work on a daily basis. We need to take a more proactive approach to utilizing agency resources more efficiently. We could reduce the amount of office space that we would need if we would encourage EPA employees to work from home on a more regular basis. If we reduce the expenses associated with	Let's try to reduce the use of in-person conferences. In these times when many meetings can be held using Skype and Adobe Connect, let's reduce the need for traveling to conferences.	We should take a look at ways to combine the functions of the Department of the Interior, the Environmental Protection Agency, and maybe the Department of Energy into one single agency. Perhaps we could combine some of the functions of the EPA and DOI into one agency. And then we could combine portions of the EPA and the Department of Energy and the Bureau for Mining Reclamation into another federal agency.

AMERICAN OVERSIGHT

	I

	A	B	C	D	E	F	G	H
390	389	5/3/2017	Concur is a cumbersome programs. A lot of time is spent to make sure that things are updated correctly. If there was a way that we could cut down on the steps that it takes to get traveled process that would save time.	I think it would be helpful if we could do more joint projects with these sectors. For example, our voluntary programs have traditionally been helpful in getting results from industry in a way that is a win-win for both sides. For tribes and local communities we need to keep our investments in these areas, as we have found in the past that local on-the-ground community based work is most effective in addressing environmental and health challenges. Additionally, this model allows tribes and local communities to self sustain their work. I think it would be a great idea if we could fund more site visits to industries. Rule writers and others involved in the regulation process have seen their ability to conduct site visits, be reduced due to decreases in travel dollars. It is imperative that we have on-the-ground exposure to the industries that we are	I think working with them directly at both the regional and HQ's level is most appropriate. I found that these stakeholders like to get information directly from us and like to be involved in the rulemaking and voluntary program design process. Public hearings, tribal consultations and one-on-one meetings are most effective. Ensuring that vulnerable communities have a seat at the table is especially important, as these communities often do not have the means to come to us.	I think if we can get technology (i.e., I-pads) so that we can become as paperless of an agency as possible that would result in a lot of cost savings. Also, if we can move away from printing materials as much as possible, that would not only help save money, but also protect the environment.	As I mentioned above our computers and other technologies are medium grade. When we take our laptops off of their docking stations they often do not work and it takes a long time for information to come back up. I think if we made the investment in higher quality computers and I-pads or another type of device this would make staff more efficient.	I think that we need to have on the ground conversations to discuss paths forward for getting work conducted collaboratively. We do currently do a lot of work in close contact with other federal agencies and states, I think we should highlight those current success stories and work to replicate them.
391	390	5/3/2017	Reduce reliance on delegating duties to outside contractors and to the practice of performing work by agency employees, or, at least, with in-house contractors. The move towards gradually relying more and more on contractors has resulted in increased costs and longer timeframes, overruns that could have been avoided if work had been performed in-house.	Better communication with these outside parties, and accountability on both sides for living up to obligations.			Update servers and computer systems to ensure proper preservation of records for FOIA and legal discovery purposes.	

AMERICAN OVERSIGHT

	I
390	I think the HR model in the private sector is an effective one. We as managers are often limited in actions that we can take to address conduct and performance issues. These limitations result in a lot of time of management time (that could be used for other activities) and results in poor morale in our areas, because performance and conduct issues impact the whole area that we are responsible. Also, I think more incentives need to be placed on employees to work in teams. I came from local government and the private sector before coming to the agency and in those entities team work was valued and encouraged. At EPA team work is valued, although are awards (sometimes) and

392	391	5/3/2017	I have a recommendation that the HR department at SSC RTP would create a Records Management Section to manage the day to day (uploading of documents, etc), backlog and management of eOPF (requesting missing records, close out, etc). Currently the bulk of this work is managed by ESS. For this work to receive the full attention and to meet agency needs a section properly trained and staffed with defined processing in place would aid in better results during audits, employees expectations and timeliness of availability of documents, and constant pressure to manage workload with these added duties. There truly is enough specialized work in this area if employees are just moved around. Flexibility in the work staff and cross training will only better a employees resume and ability to be the best HR Specialist well rounded able to fit in where ever the need.	na	na	na	na	na
393	392	5/3/2017	We have too many "mandatory trainings" to complete every year. Many are too long and redundant. Classes have deadlines for completion, or we are on the "bad" list. Taking all of these trainings (every year) is disruptive to our everyday work. Maybe EPA could require each employee to devote one whole designated day for all the training classes required each year, so that we are not constantly reminded via e-mails and through our managers to stop what we're working on and complete this one, then next week another one, etc.	Travel money is extremely limited and managers use up most of it. Let the Staff who actually do the work get out and meet with some of the stakeholders and talk with them. Ground level communication is helpful; trickle down communication often garbles the messages (if staff gets any message at all).	Stop rotating managers all the time. Some rotation is good (cross training is good), but we have too much at the agency. We have some managers who come in for a short period of time and dont know anything about the program they are managing. Staff has to teach them what is going on -- this is very inefficient - and impacts communication to our customers. Managers need technical backgrounds to manage technical programs and people. When they dont, they dont understand the issues and then sometimes make inappropriate decisions, impacting our customers.	Stop with all the "fancy" projects and stick to implementing the basic programs required by the statutes. Cut back on all the volunteer training classes that occur during the work day; voluntary lunch-time training is fine (it's on the employees time), but many volunteer training takes place during core hours. That takes away from time we should be doing our required duties.	Group computer updates - and make them happen on sign-in. We get messages every other day requiring us to stop working so that another computer update can be installed. We have to stop what we're doing, save our work, let the update occur, then reboot the computer. This is really disruptive and time consuming -- and incredibly inefficient to have to do during the middle of the day. Group them, and force them to occur upon signing in (in the morning), before we start working.	

AMERICAN OVERSIGHT

	I
392	na
393	It would be great to have more Administrative Assistants to perform administrative tasks. Technical staff should be doing technical work, not printing envelopes and licking them shut (which we do, since we dont have enough administrative staff to help).

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
394	393	5/3/2017	Most of my colleagues are challenged by the low level of funding we have been forced to operate at for the past several years. Our computers and IT system, in particular, are outdated, slow, and inefficient. A one-time investment in bringing the agency up to 21st century computational and internet standards would do a lot to help me do my job more efficiently and effectively. The current requirement that headquarters oversee nearly any significant issue/development severely hampers my ability to efficiently and effectively do my job. Forcing me to brief headquarters staff, many of whom are interacting with our environmental statutes for the first time, requires that I take time out of my busy day to brief staff who don't have a full understanding of the issues.	The states want money, full stop. If you want states, tribes, and local communities to achieve "better" environmental results, then give them more money. Cutting budgets has a place, but the agency is operating at 2011 funding levels and 1989 staffing levels. There aren't a lot of places to save by simply taking away. Give the states more funding and they'll want to participate more and, in many cases, do the job faster than we can.	States, tribes, and local communities are not "customers," they are stakeholders in a healthy and protective environment. The agency is already very responsive to these stakeholders. My idea is to continue what we are doing: building healthy and cooperative relationships with these stakeholders, providing them with the funding they need to protect their local environment, and continuing to provide top class oversight when we do.	Reinstating the Superfund tax on oil and gas would reduce costs at EPA by giving us the funding needed to cleanup sites quickly, efficiently, and effectively. Right now, reliance on PRP funding requires us to delay cleanups in order to prioritize chasing funds. It also requires us to go through lengthy reviews of fund-lead cleanups that delay the cleanup while headquarters reviews our plans through several layers. Additional funding for the CERLCA trust fund would give the agency the freedom to more effectively and efficiently clean up contaminated sites.	We could use better IT software and hardware. We could avoid political attacks on effective systems like IRIS.	
395	394	5/3/2017	Immediate Division Directors budgets are controlled (micromanaged) by Senior Management. They hire these directors for their expertise. They need to let the Directors make the most efficient and accountable use of their Division budget without letting politics and too much company policy get on the way thru all the layers of approval. The role of the on site representative in construction contracts needs to be either eliminated or defined in the CFR (Code of Federal Regulations). This title has been used for years at EPA for construction projects funded at HQs level but monitored on the field by local EPA offices. Some redundancy could be cut or managed more efficiently and with better accountability.	EPA should do more partnership work. For example, we own a facility that is located at the Metropolitan Sewage District, with all the access to treatment plants, ideal for pilot research and development studies in association to water treatment technologies. The EPA could do better partnerships for the utilization of this facility but first the facility conditions would need some investment to bring up to codes and productive environment to attract partners. Also, federal government agencies/departments need to do a better job to work together. They have plenty of resources that they can share - from people to similar interests and space. Our facility space currently seem a little underutilized. We just went thru a major mechanical renovation that cost million of dollars. Why not allowing other	Be more present and engaged in the community, listen to their needs/concerns. There is too much hiding and layers placed in between to reach authority figures, particularly with the use of computers. The use of computer "customer service" sites has alienated the human treatment / rapport / aspect hence creating detachment between regulation/or and ultimate group/people impacted. People don't talk any more, common sense is for most part lost in the multiple policies been used all around. If regulations are dictated to the real world, why don't the ones placing the regulations follow them too? Because the cause too much money for taxpayers of course! This approach, that has happened for years in the government also put engineers in bad spot as sometimes they could be asked not to follow codes and regulations.	Balance in types of contracts been used by Agency. In the recent years there have been a push to move to performance based contracts and IDIQ contracts. While I am not saying this is totally a bad idea, a closer look should be taken as to what situations are these contracts better to be used. For example: IDIQ Contracts use could deter or impact small business participation, specially those labeled as disadvantage. When these multi year, multi cost contract are awarded they facilitate government work but they also diminish the distribution of money to develop community businesses. They can also lend themselves to abuse by the winning contractor by	The Contracting process leaves out in many instances the COR. Once the PR is entered to fund a project, as COR, in many occasions you are not notified when the procurement is out for bid or negotiation until contractor(s) start contacting you. Flexibility to move skills at work, rather than grades or pay series would be good. Information sharing among peers would also be great to help develop knowledge and skills.	Take a look at common areas of interest, expand communication among leaders on those areas and open up doors for people to move easier not only inside their own agencies, groups but also at other agencies or departments based on skills not on position series. Bring back pride on work. Bring tours, consortiums, conference or some sort of clusters that can bring people together to brainstorm and explore opportunities to work together. Share the wins and the loses.

AMERICAN OVERSIGHT

394	Reducing costs is not just an up front exercise. As the experience in Flint shows, when administrations take a myopic focus on the immediate bottom line, they miss the potential for astronomical future costs. Reducing costs in FY18 may seem attractive to an administration interested in "limited government" but it runs the risk of future problems erasing those savings. In Flint, short-sighted cost reduction plans led to the lead contamination, the response to which has far outpaced any initial savings. In other words, in an effort to save funds without thinking about the future impacts, Flint officials squandered tens of millions of state and federal dollars. Administrator Pruitt and
395	Rotate and train people often, but I am not talking about canned training, I am talking about experience training - good role models / mentors to learn from. Create a clear path for progress for your employees. People learn better by exposure rather than by threat. Have managers with genuine interest and knowledge on what they manage or lead, these are secure managers and bring thrust and esteem, rather than micromanagement and fear hidden among so many policies. Take a look at the retirement system, after a certain age and depending the type of work, are people been really productive? How can you use the institutional

396	395	5/3/2017	Contract reporting requirements are through the roof. Our IT people spend much of their time accounting for tickets, as opposed to actually doing the work to clear them. If we reduced the reporting (e.g. not having to report every two days that a ticket has not been cleared because I am on vacation for three weeks), then we might really save some money. The biggest problem is that the Agency is operating under threat of budget cuts, and staff reductions. It is impossible to do your job effectively if you are wondering if you will have a job in a few months, and difficult to plan ahead if you have no idea what your budget will be like in the future, and what staff you will have to accomplish it. We need to restore the country's faith in EPA science, starting with our own administration. When I started at EPA we did the science for the water quality criteria in house, because we knew that it would be done correctly, and in an	We need to put more money into communications. We talk about how important it is to communicate with the public and our elected officials in order to complete our mission, but we continue to run our communications efforts on a shoestring, often with re-purposed scientists, instead of communications professionals. We need improved communications to better market our research, but also to help us to make sure that we are doing the right research, the right way, and then getting it to the right people.	My model is to start working with the stakeholders before the research planning begins. Working with the stakeholders to find out what their needs are, then doing the research and developing the tools to meet those needs, keeping the stakeholders in the loop. Then you get the word out to the people who can use the new tools (not just in peer reviewed journals), and provide support in their use. Then you work with them to decide what the next problem should be that you can work on together.	One thing I would love to see us get rid of is false efficiency in centralization, particularly in administrative tasks and information technology. More and more the Agency has centralized admin and IT activities, which has allowed staff reduction and apparent savings. The trouble is that the work does not go away, just because the secretary has. Now, paperwork that was done in an hour by a GS-5 is done in two hours by a GS-13 (who is less efficient because they do not do it every day), at 10 times the cost. Of course, the cost is hidden, because the GS-13 was already on staff, but the cost in lost productivity and morale is real. With IT I spend time in contacting a central contractor, who then sends an email to my local	n/a	n/a
397	396	5/3/2017	Accountable management: There seems to be a pervasive leniency with 1st and 2nd line management on holding them accountable for performance matters. Poor managers tend to stay in their jobs and continue being poor managers. They do not appear to be held to the same standard and expectations as staff. Poor performance ranges from time and attendance (some managers are just scarce/not in the office) to an inability to lead effectively or even speak in group/public settings in a coherent manner. As a consequence, in some cases, staff "work-around" these managers, find ways of accomplishing their work in spite of these managers, or just plain avoid working with these managers. This is quite inefficient.	De-centralize the Regional offices and place-base staff in geographic areas of the Regions to support key state, tribal, local and/or stakeholder communities. An added bonus would be a reduction of costs in maintaining large Regional Offices in high-rent locales. We all don't have to be in the same physical space to do our jobs effectively! Technology is great (and cheap)	Again de-centralize Regional Offices and place-base staff in key geographic areas to support counterpart stakeholders. The old concept of having large Regional offices in large metropolitan areas has been rendered moot/obsolete by the plethora of technology available to do our jobs. We don't need large offices. We can be more effective being parts of "communities" - by working and living in areas proximate to our counterparts.	There's still a few "unfunded" mandates that linger and take resources away from the Agency's core job. If we are going to get back to basics let's re-invest in what the Agency does well which is clean up hazardous waste sites and oil spills - let's fix these problem sites so communities can safely rebuild and reinvest these contaminated lands.	We need to be able to use drones as platforms for sampling, monitoring, and assessing cleanup sites and responses. These are incredibly cheap and efficient and just about every other federal agency uses them. We can be more efficient (and spend less money) in doing our job.	Again - I believe de-centralizing Regional Offices and place-base more staff in key geographic areas (i.e., communities) of key counterpart stakeholders will significantly realign activities between other federal/state agencies. We need to be "members" of these communities to be able to be more responsive to our counterparts. We're too HQ focused in the Regional offices.

AMERICAN OVERSIGHT

398	397	5/3/2017	Management can start by appreciating the hard work and dedication of the employees here at EPA. We want to apply the laws and enforce them however politics and big money distorts the facts and make EPA as the over reaching scapegoat. for example, The Coal industry....FACT, The Natural gas industry is killing the coal industry not The EPA!. Mr. Pruitt needs to step up and concur with that fact.	Being able to continue to communicate via phone, email and in person with them. I would like to visit in person and establish relationships with our partners. There has been no money for travel.	Travel dollars to visit and become a part of the community we serve...We have no money! and you're cutting funds by 31%. makes no sense.	Training and informing the public... I visit High Schools and most kids don't even know what EPA is. Lets do more public service announcements. Educate the public in what we do....put more eyes on reporting non-compliance of our environmental laws. Environmental Advocates are our friends...they have the money to take things further into investigating than the EPA.	Yes, put an internet channel in our schools.	Yes aligned EPA with the CDC. and The Office of Noise Abatement and Control (ONAC) was created within the Environmental Protection Agency (EPA) to oversee the impact of noise on the general public, However, In 1982, funding to ONAC was virtually eliminated, depriving citizens of federal protection against noise and its deleterious effects. I review projects and attend community meeting all the time. People mostly complain about is noise. We the Administrator to request funding to support the Noise program.
399	398	5/3/2017	IT is an issue. Our computers and software are old compared to the state of current internet requirements. For example, Internet Explorer is the standard web browser, but many sites, including some government sites return a message that the browser is no longer supported. It creates difficulties to have to figure out which software to use for each site. Frequently, we have to use government computer interface sites for administrative purposes, and they are only partially functional. I think it would help to have more extensive support for existing sites, and beta testing of new sites before they are rolled out to the workforce.	Funding is a major limitation for effective environmental protection. When we partner with sites, limited funds prevent fully characterizing potential human health risks. For example, we need methods to understand contaminants in wild fish and aquatic foods that many tribes subsist upon. However, we do not have funding to support development of these methods to assist tribes. We do not understand the extent of lead contamination in communities as funding is insufficient for localities and states to do the testing of children's blood and environmental sources of exposure.	See above, greater support for local programs would help them greatly.	I am not sure I have the big picture to be able to answer this. EPA has to be very careful with using science and with making rules because we always get sued when new rules are issued. The Agency culture is cautious and careful; care and extreme diligence adds costs to doing business, but at least we know the results will be robust.	Better IT function and some administrative support for senior level staff would improve efficiency and save money overall. Right now we have GS 15s making copies, taking out their own trash, doing some of their own travel legwork as admin. and janitorial support has been cut. Most office equipment is not functional (copiers, fax machines) as there is no money for maintenance or repair.	It is important to continue multi-federal agency initiatives and workgroups. By talking together on topics of mutual concern, we can better divide up work, have each agency focus of core strengths and abilities, and collaborate together on multidisciplinary end products.
400	399	5/3/2017

	I
398	Keep engineers and scientist trained and learning. Cross train them between other similar federal agencies and have funding to train and freely exchange professional staff.
399	We are getting very good at communicating among multidisciplinary team members. This kind of cross team communication and coillaboration is what will be needed to address the challenges of the 21st century.
400	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
401	400	5/3/2017	Travel and timekeeping responsibilities have been shifted from administrative staff to technical staff. This is inefficient. One administrative person employed at a GS7 level and trained in these tasks would be much more efficient than GS11 engineers and scientists taking care of these tasks.	Tribes need civil service protection for their employees so they are not simply fired every time a new administration takes over. They also need to offer better wages so employees stay. We wind up "starting over" with new tribal employees frequently.	Field offices would be a big help. Large regional offices with high rent, cost of living adjustments, transit subsidies, etc. are not cost effective. The Region 10 model with field offices in each state provides easy access to those we regulate and need to coordinate with. Rent for office space is less expensive, cost of living adjustments for employees are eliminated or lowered, travel for inspections and meetings is much less expensive. It makes EPA staff much more available to people who need their help.	Yes, in November, 2006 the Region 10 office conducted a study regarding the efficiency of their field offices. It clearly showed a savings of over $1 million/year to locate staff in field offices rather than in Seattle. This also provides the public, local, tribal and state governments much better access to EPA staff.	Electronic records; we still must print and keep a paper copy of official records.	CWA 319 funds should be taken from EPA and given to USDA Rural Development to administer; they have a very similar program and are much more knowledgeable about agricultural practices. AND USDA Rural Development Funding for Drinking Water and Wastewater infrastructure should be taken from USDA and given to EPA to administer. USDA does not understand what a good vs. bad drinking water plant looks like. They have built many facilities that do not meet the requirements of the CWA or SDWA from the day they start up.
402	401	5/3/2017				It appears some of the offices are having to give up office space due to excessive rent. Those spaces are now being provided to non-government entities, creating some security issues. What if we considered doing what some of the private sectors do, wherein they create a day care facility within the building in the open spaces for employees in the building, funding by those parents using the services - and excess funds going towards rent, etc? It would be significantly convenient for employees who have to drop off/pick up young children elsewhere in the large metroplexes / use public transportation. It would also be a great recruiting option for younger folks into the EPA		

AMERICAN OVERSIGHT

	I
401	EPA employees are held to a very high standard for ethics. This is appropriate and should be the case throughout the federal workforce. I could not even serve on a small local school board without prior approval of the ethics officer in my region.
402	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
403	402	5/3/2017	Because of all of the scrutiny of every EPA and federal employee- often exacerbated by politicians and people who have decided all EPA employees are focused on job killing and destroying the entire country- the administrative processes to do our jobs have become incredibly bureaucratic and cumbersome so that we are held "accountable". For example, to buy work boots so I can go out to sites and ensure the contractors aren't wasting tax payers dollars, I have to: put in a purchase request; that request must be signed by my manager, the purchasing official, an my associate director. Then I have to have the purchase card holder accompany me to the actual store because I am not allowed to use a purchase card- so now you have two FTE going to buy work boots. After all of that- it still didn't work out because there was a person in HQ that needed to authorize all of this. So I ended up paying for my work boots out of pocket and am hoping to get reimbursed.	Don't hack our budget because most of our monies end up in the hands of the local and state governments. And don't assume that they want EPA to go away- we actually help support them a lot and sometimes they need us to be the gorilla in the closet to achieve their objectives. And the private sector- I guess the same thing. They get a lot of grant monies from EPA. And pretty sure they aren't super excited by the idea of having all of the federal work delegated down to them with no funding to do the actual work. And Tribes! Well, right now they are just totally freaking out because the political rhetoric implies that they are no longer going to have their treaties honored. Recommend that you do some major outreach to the tribal governments and start trying to clarify if this Administration intends to uphold those federal requirements given	Stop attacking EPA employees. Stop saying that the priority is jobs and reigning us in because most people know want to know that the priority is the mission and upholding the laws that keep air clean and waters drinkable/swimmable/fishable. And stop micro managing everything- it looks really wacky and you are freaking out both the regulated community who likes to know what the expectations are for planning/budgeting and the general public because they don't trust you. All you are doing is eroding public trust in government.	Stop trying to micro manage the entire agency. It is way too large and there are too many projects to run every single one of them through HQ. It slows everything down, and eats up time. And as you all know, time is money- especially when someone is hiring contractors, legal counsel, etc. And don't waste time trying to figure out why permits are slow to get out the door, etc. It's a simple answer. Because we have the lowest level of staff since 1989. Because Congress/politicians keeps saying inflammatory things about federal employees and EPA- adding additional layers of bureaucracy and process to the most basic things we have to do under the banner	Not new technologies that I know of. But stop entering in to piecemeal software contracts that then end up eating a huge amount of time because the softwares aren't compatible and then there are a bunch of agency resources and monies eaten up trying to make them compatible.	Provide funding and technical support to our partners because we have expertise that no state can ever have and cannot be replaced. And we have lots of funding vehicles to help support that work.
404	403	5/3/2017	Better organization of the training requirements would be helpful.	More outreach and more opportunities to meet with our partners in person,	More true dialog with opportunities for the public -- not just paid representatives of organizations -- to voice their thoughts and ideas. More public meetings outside of DC.	Distribute a list of federal facilities where meetings of various sizes can be held around the country. With efforts to keep costs low, we have limited our reach to meetings held in regional offices. Have OPE be in charge of facilitating meetings outside of DC.	Is it possible for Americans to post videos expressing their views to the docket or an EPA website? Younger citizens may want to share information from their phone, including videos, and do we have a way to receive that? Further increase the education about what 508 compliance is and how to make our work more accessible to everyone!	Continue to work closely with other scientists on climate change. Support interagency agreements to share staff and develop expertise. Support rotational assignments to the Hill and state-local agencies. Good for EPA and good for the receiving organizations.

AMERICAN OVERSIGHT

	I
403	Yes. In many other sectors, they actually trust their employees and treat them with respect. For example, they wouldn't have a giant signing ceremony with pomp and circumstance for a policy that tries to roll back a bunch of their work. They wouldn't put a leader in charge who has publically attacked the entire organization and the people in it for years, or challenged the work of that agency on multiple occasions in court. They wouldn't put a bunch of people who don't trust science or scientists in charge of scientists. For example, when I worked at a biotech company, our CEO was a MD, and all our directors were PhDs, because they all could understand the science we scientists were doing. Super
404	Concur is the worst travel system. It is not allowing us to choose the cheapest options and it is bureaucratic and unwieldy.

Among other things this will provide a better collaboration with Regional politicians who, after all, have legitimate rights to pursue activities in their respective Regions. They want us to "Do Things" not pursue thinly disguised Leftist political agendas.	If you look carefully at some of the technologies that have emerged from our nations efforts to prepare for a large scale terrorist event, and most of the technologies came from DoD through the Army as the R&D lead, you will see that they have found applications to all kinds of environmental clean-ups. I think that within this Agency you may be surprised to find how useful efforts made to study the decontamination [still disinfection to most people outside of EPA, particularly in Medicine and Public Health] are actually providing outstanding dual use value to healthcare. Our work looks at decontaminating [disinfecting] real world surfaces. This fits with our disinfectant registration functions. It's a big win-win.	OSRTI and OLEM need to consolidate their Emergency Response functions. Specifically, the Environmental Response Team (ERT) and the Consequence Management Assessment Team (CMAD) need to be consolidated. This has been impossible, despite the obvious sense of it, because of intra-organizational turf and personality problems. It needs to be solved at the Administrator's level. It makes good management sense and needs to be done. The Administrator also needs to read a report compiled by a Senior SES Region II DRA named GEORGE PAVLOU on these subjects. George
406	405	5/3/2017	The structures regarding resource allocation (FTE and other) seem to be managed for staff/manager numbers and other considerations rather than for efficiency and effectiveness. In other words, the management process seems confined in such a way that sound organizational innovation dies on the vine. I am currently involved in just such a situation.	In my area of work (program communications), I advocate improved use of distance communication tools (like Adobe Connect) for training, compliance assistance, and oversight functions. These tools can extend our reach so we can better meet the needs of our States and Tribes. For example, exploring strategies for virtual, on-demand training could help leverage our technical expertise to provide more consistent guidance and support from EPA while addressing challenges from staff turnover and travel restrictions seen across our 5 states. This would require linking technical and communications expertise.	In my area of work (program communications), more effective use of distance communication tools (like Adobe Connect) saves travel but also allows better communication in general across our 5-states. The result can be greater transparency, more inclusion, more involvement at all levels of government and with the public. We have barely scratched the surface in using these tools.	Again, since I work in program communications, I see great potential in virtual and/or on-demand communications tools. We have the software tools, but have much to explore in how these tools are actually used and put into real service.	We have many wonderful technologies available to us but, from my perspective, our staff have barely learned how to use them. In my own work, I think virtual communications could be utilized for many purposes, even as a means to re-invent our processes for State/Tribe oversight and program review. Of course, sometimes the States/Tribes are unfamiliar with the new technology, too. There are many applications possible for use of virtual tools, and I think if one is to serve a 5-state Region really well, this technology is practically essential.	In the programs I am familiar with, perhaps creating a more clear hierarchy of Agency involvement would help. There sometimes seems to be "too many cooks in the kitchen." Some Agencies responsibilities need only be review and concurrence while only one or two have a lead role.

	I
405	We need to get back to hiring and promoting based on the Merit System. This Agency for Social Engineering purposes, that is installing people of a political and social orientation favorable to the Leftist cause, has turned the Merit System on its head. They have by-passed it. That is not only a disgrace but as I imagine this has gone on across the entire Federal Government I view this as having inflicted serious damage to the Civil Service as an institution. The role and function of the Civil Service as a crucial and non politically aligned part of our government has to be reasserted. AND, we CANNOT PUNISH CIVIL SERVANTS for policies of the previous
406	Well, I work in communications and see great potential there. We need to be talking more, collaborating more, and assisting more, sharing more with our States and Tribes. From my perspective, we have seen great and positive results from using virtual resources as effectively as possible. However, our results have been quasi-experimental...we have a long way to go before this technology is fully integrated organizationally. As I see it, we seem to have new solutions pushed our way all the time, but we don't always now how to implement it on the ground. This may take time and experience, training and re-thinking.

407	406	5/3/2017	This is not an EPA-specific problem, but a government-wide one. I am providing the comment in case EPA has the opportunity to weigh in on broader reforms across the government. All government agencies are required to have their printing done through the Government Publishing Office. GPO doesn???t do the printing itself, but contracts it out to private vendors. (Although GPO charges a fee for this service.) Everyone I know at EPA that has tried to do printing, publishing, or large mailings has horror stories about it. The requirements are a morass of paperwork and red tape, without clear explanations or guidance. The process of bidding and awarding contracts is slow, creating significant delays that affect project schedules. And the low bidders that win the contracts sometimes provide poor quality work, so there is no real savings.					
408	407	5/3/2017	The paper concurrence process should be replaced by an electronic concurrence process. Training should be made available to those unfamiliar with features useful for the process such as MS Word TrackChanges, SharePoint and OneDrive.

409	408	5/3/2017			Risk communication training - the art of communicating science concepts in plain English without losing complexity and without ignoring the emotions associated with the ideas being discussed - should be a standard skill set for all who work with states, tribes, local communities, the regulated community, and the public at large. The scientific skills that serve us well internally are different than those that serve us well with our partners and those that we serve. In addition, some focused immersion experiences - working for 1-2 weeks from a remote location where a project is located or will impact - would give perspective. For instance, living in an area where rural broadband internet is slower, where the volunteer ambulance service is 20-45 minutes away, and groceries are 30-40 minutes away add perspective to the policies being written. What works in an urban area			
410	409	5/3/2017	The requirement in appropriation law or policy that limits the fungibility of funds across appropriations. If these limits were eliminated or relaxed, we would be in a better position to apply funding where it is really needed. Our contracting mechanisms also need an overhaul to standardize policy across the country. But the end user needs to be consulted when changes are made.				Our software is woefully out of date. We are still in the early 20th century with some of the legacy systems we are forced to use.	
411	410	5/3/2017	I am an attorney. We get paltry litigation training, and the training we get is from EPA attorneys who are rarely in court.	As an attorney, having Government field/regional attorneys attend and participate in more CLE events with the private bar. Currently, we have little to no interaction with the private bar outside of negotiations, and because we have no travel budget, there is little face to face time, and so few opportunities to dialogue and build relationships with members of the private bar.	Free up additional travel dollars for face-to-face meetings. It is difficult to provide customer service only over the phone, or via EPA's generally unreliable video capabilities.	Currently, this regional attorney has almost no reliable admin/paralegal support staff. Instead of taxpayer dollars spent on my legal salary going to me doing legal work, I instead must act as my own secretary - literally prepare and arrange mailing of my own documents, do my own bulk copying, arrange my own meetings, and meet with paralegals from the private sector firms. Embarrassing.	Tech is sufficient. We (ORC) just need more admin support.	More joint field meetings.

AMERICAN OVERSIGHT

412	411	5/3/2017	Administrative requirements: There are too many administrative assistances in the agency. I recommend streamlining administrative assistances, there is no need to have too many. Every staff has the tools needed to do their jobs, we are in the 21st century with 21st century technology. The Agency has invested a lot of money on bringing the technology needed to do our job in an effective manner, so that the need for secretary or administrative assistances has been reduced. Of course, some limited administrative assistances are needed for the upper/senior management positions. I have noted that some directors have a secretary and an administrative assistance with similar tasks. Clear definition of the roles and responsibilities of a Deputy Division Director should be stated. Some divisions have an administrative assistance that perform duties related to the Deputy Director (i.e., travel budget, tracking commitments, etc.). I recommend reviewing the Position	Working with states and tribes on their programs work plans to ensure consistency with federal rules and regulations. Provide regulatory assistance to private sector to ensure compliance with permits and statues. Empower communities to report environmental crimes.	Working with states, tribes, local communities and private sectors has been a challenge for EPA. In my 28 years working with EPA that has been the case. I have been extremely successful working with states, territories, tribes, local communities and private sector using a collaborative approach instead the enforcement approach. Provide assistance on grant management and provide support on this area is crucial for states to succeed in compliance with their work plan. Provide assistance and working with private sector on how to comply with permit and regulations is valuable. Listen and be engaged with the local communities is the key of success on building credibility.	I believe the agency should consolidate some regional offices to reduce costs. For example, why EPA is paying for satellite offices with one or two employees? I recommend closing those offices and move the staff back to the central hub or share a space with a sister agency or state agency. In addition, I suggest combining. For example: (1) R1 with R2 (transferring the Caribbean territories) (2) R-4 (transferring KY and adding the Caribbean territories) (3) R-5 (adding KY) (4) R-6 with R-7 (5) R-9 with R-10 Another suggestion is to centralize the all Tribal affairs and all Territories affairs in HQ. Combine laboratories will reduce the cost of leasing.	I believe there are many technologies available. EPA has adopted several of them, for example: Skype for business, Video Conference, SharePoint, Outlook, and SEMs (filing database). The issue is not having the technology; the issue is more related to not using the available technology by the staff. I recommend establishing clear guidelines for using those available technology, encouraging the staff to use them. The use of tablet or iPads on the field during inspections will facilitate and expedite actions. Having a central e-file room would be fantastic to improve our response to inquiries (FOIAs, congressional, states, local communities, etc.) and to reduce physical spaces (cost a fortune).	Kind of tricky, since EPA has specific authority under the law to carry out some responsibilities that cannot be delegated to other federal agencies or states. There are programs that can be delegated to the states, and we have done that, however, there are states that don???t have some of those delegated programs for various reasons. We can continue working with those states to assist them to obtain the delegation, but keep in mind that some states clearly stated that they do not want those programs. For those states with delegated programs, EPA can continue providing financial assistance to
413	412	5/3/2017	I am an Acquisition Manager responsible for a Regional office. I report to a Regional manager for day to day operations and to the (HQ) Senior Procurement Executive who has functional (Acquisition) authority for the promulgation of policy and procedure relevant to acquisition regulations (FAR and EPAAR...) and in issuing warrant authority to all agency Contracting Officers. While I have a wonderful boss and great working relationship with both my direct supervisor and functional authority (HQ), there is a continual challenge that exists when applying business decisions and operational matters that cross regional lines. Business operations are often fragmented and inconsistent under existing silos and productivity is diminished.	Within the acquisition community, the interaction that takes place with external stakeholders is largely driven by the program offices in which we support. However and specific to partnering with the private sector, standardizing business practices and awarding contracts with a stronger emphasis in shifting risk from the EPA to the contractors using firm-fixed price agreements would lead to enhanced performance management and likely result in cost savings. While a lot of the work the EPA does, for example in remediating hazardous sites, cannot be sufficiently defined in advance due to the nature of the work, a deliberate approach to maintaining engineering and contracting expertise in the fields of design, construction and related activities would benefit the EPA by enhancing ownership and defining process where the	Efficiency, economy, the application of best business practices and accountability should be the first goal in recognizing our positions within the agency and the government. The term "customer" needs to be defined such that it pertains to those entities listed above and not to internal members of the EPA; this will enhance teamwork, define ownership, delineate lines of authority and ensure everyone is performing as equal members of a team in which responsibilities are recognized and respected across all business and program lines; all of which relate eventually to cost and delivery to our public and taxpayers at large.	Yes. Standardize the acquisition of goods and services across the agency, consolidate like and or similar items and formulate budgets such that delivery of products and services are procured both to meet agency needs and to satisfy efficiency and economy. Reduce unnecessary duplication of effort by increasing collaboration with the principle stakeholders (i.e., contracting, fiscal, programs...) to better leverage resources both in human capital and finance for creating an emphasis in conducting business sensibly and responsibly.	In the world of Acquisition, methodologies such as "Category Management", "Strategic Sourcing", "and Centers of Expertise" have been used successfully by other agencies to create efficiencies, enhance specialization and standardization and to contribute to cost savings through enhanced competition and in some cases obtaining volume discounts. The EPA has initiated some of these concepts but not to any degree of adequacy. Specific to technology is an electronic procurement system that functions well and with the ability to capture and manage data for reports and workload management; the current EAS system is inadequate.	Realigning activities within the agency is a good thing as long as it is done properly. Aligning activities with other agencies comes at a cost both financial as well as functional. For example, offloading work to the Army Corps of Engineers typically comes with an overhead cost of 10% for each project; this equates to millions of dollars potentially coming out of the EPA budget in lieu of hiring at a much lower cost internal employees and in investing in the EPA human capital infrastructure for long term stability.

AMERICAN OVERSIGHT

	I
412	Collaborative approach vs. Enforcement approach. Effective use of IAG and MOU/MOA Use of best technology available.
413	Yes; I was responsible in my previous agency for developing what became lauded as "best practices" relative to workload management, quality and compliance, and training. The challenge is implementing any best practice across fragmented business lines which constitute decentralized programs. The EPA represents a decentralized acquisition program which makes it difficult if not impossible to implement standardized best practices and a coherent supply chain that operates with optimum efficiency. At the EPA, we should simply maintain regional acquisition presence in the Regions to support our major Superfund program activities and a handful of

414	413	5/3/2017						
415	414	5/3/2017	EPA Headquarters Staff turn-over; there are too many rotations and personnel changes for reviewers of Regional documents. Changes of Formats for EPA documents back and forth every few years; it is unnecessary. Managers assign Superfund projects whimsically with no consideration of experience, or understanding that "Learning Curves" take up more time and expense. I would address these by eliminating HQ review of every document; resisting the urge to constantly change Document Formats; and teaching EPA managers that frequent turn-over of Superfund project managers delays final achievement of cleanups.	Eliminating the involvement of State Agencies in the Superfund process. Superfund projects cannot be deleted from the NPL or declared clean because State Agency Staff personnel constantly require more data and refuse to accept PRPs' or EPA's decisions that a Site is "clean." If the Superfund program is delegated to the States, Private property owners will never receive approval that their real estate or groundwater is "clean." [State Agency Staff require that Sites be "studied to death"]. Also, Use EPA Guidance as "guidance" and not as "mandatory."	Provide the US EPA Superfund program with Funding and eliminate the requirement for consultation with State Agencies. US EPA Superfund Project managers need autonomous decision making authority, and the authority to budget and approve direct spending on Cleanups. If US EPA is ready to approve a Cleanup by the Regulated Community (i.e. Private Parties), State Agencies almost NEVER recognize or concur with US EPA's acceptance of a Private Party's cleanup achievement. Also EPA managers are forced to use Guidance as "dogma," instead of having Guidance "guide" ... a manager here actually said once that following Guidance is "mandatory."	The Burdensome process of awarding Government Contracts. In Private industry, Project Managers are allowed a Spending Ceiling for which a Purchase Order can be directly issued (after getting 3-5 quotes). At EPA it takes 6 months to develop Contract Bidding packages, 2-3 months to advertise for bids, 2-3 months to review and evaluate bids, another 2-3 months to announce the winner and appease the losers, and another 1-2 months to get the Funding approved and Contract Awarded. What should take several weeks (finding and approving and scheduling a contractor) takes the US Government 1-2 years to award. US Government contracts also require anywhere from 3 to 10	Actual Computers and Laptops and Internet Servers that actually function would be a nice start. The previous 8 years' Administration's "austerity" policies have left EPA far behind when it comes to I-T. I can do better individually by picking out old Laptops from Recycling Piles and fixing them myself in my basement, when compared to the computer equipment provided by EPA.	Have each Agency maintain their own Procurement Staff, instead of relying so much on OMB. Use Corps of Engineers exclusively for procurement for EPA, because USACE already has the procurement infrastructure in place. Eliminate the partnerships with States regarding the Superfund program because State Agencies are the SOLE REASON why NPL Sites cannot be declared as "clean." State Agencies have Private Parties in their crosshairs, purposely (because of all the State-perceived "profit" that private parties have in their pockets). US EPA tries to be flexible but the States
416	415	5/3/2017	slow processes new regulations hamper efficiency overworked - new tasks compile, old tasks remain slow to change too many people have a say (too many cooks in the kitchen) and not enough employees to carry out the work very very weak leadership I don't get paid enough to come up with ideas and have them "implemented" - no need to waste any more money or time on it.	I don't care anymore - I have given suggestions for improvement and have been dismissed too many times. 417	416	5/3/2017	Consolidate all FACA Committees in the Agency under one administrative organization with centralized support and administration. Each committee would still have its own DFO, however full support would be more efficiently centralized. Furthermore, this would provide better separation (more independence of the committee) from the programs that the committee is associated with.					
418	417	5/3/2017					Paperless technologies are badly needed. This includes the ability to sign document electronically and store/manage agency records electronically.	
419	418	5/3/2017	Professional and technical staff are currently required to perform their own administrative functions. I would address this problem by adding more FTE for administrative professionals. Certainly, we don't need as many as we used to have, but we have come to far away from effective administrative support.	Working with States happens throughout the Agency. Staff working with States and local agencies don't have enough communications training or support. Additionally, State and local liaison duties take considerable time away from other official duties. Reducing the amount of funds passed to state and local partners would allow for additional staff to better prepare staff and support EPA staff working in these positions. I can think of no better way to make a gold-plated partnership.	Hiring professional customer service staff and putting real resources into costumer service tools.	Updating electronic resources would improve efficiencies and reduce long term cost. Minimizing the use of long-term contractors, as in I.T. for example, and converting those positions to full time supported EPA FTEs would reduce cost by eliminating the need to pay for third party profits. Contracts should only be used for short-term projects with a defined scope.	Google Chrome, Word 2016, Access 2016, Skype Sampling drones would improve air and water quality monitoring. Emergency response robots would allow for safer hazardous area monitoring. Continuous remote stack monitoring requirements would allow for better coordination of Agency resources.	As illustrated by the Flint Water Crisis, we need to proactively identify those partners that are in the process of disinvesting from areas of shared responsibility and mutual interest. We need to redefine relationships on a continuous basis and treat disinvesting partners more skeptically. We need to focus on the big picture and ensure that when we have handed off the responsibilities outlined by Congress to another party, that those entities remain accountable to the American public. We cannot wash out hands a state that it's now someone else's responsibility. These responsibilities remain

420	419	5/3/2017	Having to complete a webform with information on my work at home workload every time I do episodic. This is not required for regular work at home so it makes it harder to sign up to work at home when you plan in advance.	Making sure to add grant conditions only when they are necessary and not having them carry over every year. A lot of activities that are performed per grant condiditons the state agreed to and should be put in a workplan or supplement	Agreeing to current state workload and working on next years grants at different meetings. These tasks are often done at the same time and the customer service is not .		We have put up many barriers to sharing information with our state and tribal partners in SharePoint if the technology could be made to access in an easier format that would help greatly.	We should share more of the workload in maintain databases and doing QA on data that the public has access too. It seems a great workload that the states maintain databases and do their own QA/QC when EPA is working on on the data too.
421	420	5/3/2017	In our Regional office, there are many fire drills apparently aimed at educating the new leadership in Washington DC. These all take time away from doing statutorily required direct implementation work (work NOT delegated to some other agency such a State agency). Furthermore, it is a significant challenge to work in an environment where we never hear one word from our new Administrator, environmental actions (e.g., Executive Orders) seem to be for political purpose with little to no basis in scientific rigor, and the federal government as a whole is generally treated with disdain by the highest offices in the Executive Branch. If senior leaders in Washington wish to win over employee allegiance for the many actions being taken through fiat, please first demonstrate an understanding of the requirements, and second supply the unbiased, peer-reviewed reports (not just assertions) that demonstrate whether or not there is an overall harm from EPA	I support the idea of electronic reporting that actually cuts down on paperwork and time. It needs to be accompanied by reasonable accuracy and accountability requirements. In my 25+ years of experience, EPA and States mostly stay in their lanes. Where States have statutory authority given them by EPA, EPA does not overly interfere with their implementation beyond tracking the expenditures of federal dollars. Similarly, where States do not have statutory authority, EPA works hard to implement the requirements directly and expects to do so without interference from States. Do not forget that not all of EPA's requirements can be legally carried out by States. In most of Indian Country, EPA has a duty to carry out statutory requirements, as well as in those locations where States have	We already ask for comparatively little accountability for the grant money given to carry out environmental programs (which often is insufficient anyway). If we were to include the "public at large" as a customer, we would have the ability to actually respond to complaints and the authority to conduct investigations. In my experience, attempts to respond to complaints from "the public at large" are met with resistance from industry and other agencies (notably States) and interference from politicians.	We change Windows operating systems regularly which results in disruption to our computers. Probably everyone everywhere experiences these necessary upgrade problems. There is also a lack of support for the many different data systems that exist, especially beyond the big, well-known systems. The changes in operating systems can negatively impact legacy data systems, which then requires hunting for resources to either fix them or re-create them.	Maybe use of flying drones?	Create workgroups with other agencies that discourage turf battles and encourage cooperation.

422	421	5/3/2017					EPA is probably not the best agency at managing data. Each national program and subprograms and each region seems to have their own home developed set of databases for tracking Air, Water, Land activities, inspections, number of permits issued and compliance assistance, and enforcement. This results in a number of inefficiencies, not the least of which include: 1. no regional or national dashboard for executive decision making. 2. inability to conduct what would otherwise be simple searches for responsive documents to respond to FOIA requests (must search across multiple databases by multiple people in multiple programs. A more effective and	
423	422	5/3/2017	When the Administrator's office makes decisions without any briefing on the issues (which would discuss options, consequences, and vulnerabilities), it prevents everyone else from doing their jobs efficiently and effectively. The program offices and OP are experts at explaining options, interests, and consequences, OECA has expertise in identifying enforcement and compliance-related issues, and OGC can elaborate on the legal options, issues, and vulnerabilities. Taking all of that into account BEFORE making a decision is A) what it's our job to do and B) a lot more efficient for everyone. Because when those factors are not briefed and considered beforehand, it results in unintended consequences and vulnerabilities, which the agency either has to correct (through additional action) or litigate. Moreover, in some situations, it has been even worse because the Administrator's office has not even informed the relevant offices about a decision until after the fact ??? so the implementing office (not to	Next-gen enforcement strategies that incentivize or otherwise automate compliance are critical (e.g., real-time monitoring). In my experience, states, tribes, and local communities only want to take the lead in delegated programs if there are resources available to offset the costs. In the absence of such resources, states, tribes, and local communities have tended to withdraw from implementing programs rather than enlisting. So without more funding at one level or another, I don't know how the states, tribes, or local communities would maintain the human capital to achieve better environmental results, as they often look to EPA to provide technical help on a variety of issues (e.g., toxicology, modeling, etc.).	Due to staff shortages, people are juggling so many different assignments and need to coordinate with people across various offices who are also juggling many different assignments. So when a particular issue needs resolved, it ends up taking a lot of time for each person who needs to focus on it having the time to actually focus on it. The dividing up of FTEs to cover multiple areas also diminishes the expertise in each of those areas (as the employee might only have the capacity to deal with it a couple times a year). Another consequence is that oversight of the Regions and coordination with one another is diminished ??? as those are things we should do but just can't given the constant fire drills. 424	423	5/3/2017	None, everything works smoothly in our office.	First, let the people at EPA who know how to do this job, do their job. Most are career employees who have acquired institutional knowledge that takes many years to understand. Second, please question carefully the potential impacts of implementing policies and directives that do not support or provide little support for protecting public health and the environment. The states need EPA as top cover and rule makers to help them carry out their state regulations or they will get challenged through litigation and frivolous law suits by their permit holders. On the other hand, EPA welcomes law suits as it makes us work better and harder to support our rules and regulations with scientific evidence.	It's not about providing better customer service. The EPA IS NOT a business but a government REGULATORY agency. EPA develops, implements and enforces federal rules and regulations to protect the environment and public health. Don't get the two mixed up. EPA is charged to protect the people and environment of our country and to represent our country in related international affairs. EPA authorizes the states and tribes to carry out Clean Air Act and Clean Water Act programs but if they cannot function and do this effort then EPA will do everything it can to support the state in their effort or EPA steps in and does the work for the state or tribe because it is required to do so. That is what I call EPA Customer Service.	None, all is operating smoothly.	All the equipment, technology and software provided to us for carrying out our operations works effectively.	I don't think this is possible. Other government agencies are not charged to protect the environment and public health of the American people. This is the unique role of the EPA. We work directly with and also fund the states and tribes to carry out the federal laws. The EPA allows the states and tribes all the flexibility they need to execute their regulatory programs to best meet their interests and needs (population, resources, capabilities, economic, etc.), all of the states and tribes are different and have to be worked with carefully, with much attention because of their differences. We cannot afford to put the
425	424	5/3/2017	Reduce senior management levels by 30%. There are too many chiefs and not enough Indians at EPA. AAship staff levels should be not more than 5-7% of the program population it oversees. Implement direct reporting for all programs. Is it really necessary to report to OP on rules/policy that only impacts one program? Why does it take two or more years to make technical corrections to rules and policy that would streamline or clarify information to the regulated community? (e.g., getting old regulation off the books). Favoritism, cronyism and nepotism have destroyed senior management ethics. Instead of creating more senior management positions, reorganized the entire Agency and streamline the organization. AAships should not have more than 5-7% of the program staff population. Any remaining staff needs to be downgraded and the FTEs put back into in the program as worker bees. Listen to the EVS survey - Get rid of bad management. .Eliminate cronyism, favoritism, and nepotism and clean up	EPA has a long history of partnering with states, communities and tribes. The tough job is for the Administrator to help keep the balance in the community. Everybody comes to the table with an agenda and the hope of "feeding from the federal trough."	Make states/tribes more accountable for use of grant funding. A report card?	Use sun-set provisions on significant rules and policies and mandate reevaluation of such every decade. Make it a goal to reduce the number of unnecessary cross office reviews. Implement a judicious use of tracking systems and do not track activities just to "count beans."	IT modernization. Electronic portal for data transfer and submission should be the number one priority. Force industry into reasonable IT upgrades that can be passed on to the next contractor. Way too much "proprietary" IT is integrated into government database systems that have to be rebuild, for a higher cost, when the next contractor takes over. This is not a good use of tax payer dollars. .	It would take more EPA budget. Most of the responsibility of sharing between government agencies relieves on bringing some budget to the table. It can be cost effective, but EPA has no leverage unless it can contribute.

426	425	5/3/2017	1. Please lean hiring. Our hiring process is long and tortuous, and the shared service centers are a DISASTER. 2. As a manager, it is a long and tortuous process to fire a poor performer. I don't mind doing a PAP or a PIP, but why do we need to do both? Please streamline the process to fire people who are not performing. 3. Also, as a manager, I am upset that we are negotiating an agreement with the union(s) that will allow people to work from home five days a week. It's difficult to manage them under those circumstances. I wish we could cap telework at 3 days a week. 4. I also feel like a number of administrative processes were put in place after John Beale's abuses of the system were uncovered, that punished everyone equally for one bad apple. Please take a look at how long it takes us to do our timekeeping and travel, and make sure that it makes sense.	We already do an excellent job of partnering with states, tribes, local communities and the private sector.	As a manager, I can tell you that the more you cut our FTE, the more you slow down the work. I used to have 3 people who ran the PCB program. Now I have one. That person has the same amount of work, the same number of phone calls, the same number of companies and citizens to help. If you want better customer service, protect our FTE.	Lean the hiring process. Get rid of the shared service centers for human resources work - return those resources to the regions.	Dear God, yes. Please support projects to take hardcopy records electronic. The RCRA program was trying to modernize their records, but they don't have the resources that Superfund does. Give financial and political support to Barnes Johnson in ORCR to take those records electronic. Also, support E-manifest, that will be one of the legacies you can leave in the agency.	EPA has a unique mission, and we already work very well with states.
427	426	5/3/2017	The fact that we have to lock in a work day that can not be changed without prior approval is very difficult. I know other agencies have the flexibility to adjust their schedules without prior management approval. For example, most federal and private sector employees have the ability to arrive earlier than normal, or leave later than normal, as long as they get their 8, 9, or 10 hours in. We work with stakeholders all over the country (world at times), so having to commit to begin work at 8 am and stop promptly at 5 pm inhibits our availability to work seamlessly with certain stakeholders. It would be much easier and more efficient if we had the ability to adjust our schedules to the work load as needed. We can't always foresee a last minute phone call or face-to-face meeting two weeks in advance.	I came to EPA from the private sector within the last twelve months. In my previous roles with small and large companies, my work was directly impacted by EPA programs. These voluntary programs were instrumental in building the businesses I worked for, and in some cases those businesses relied solely on EPA programs. Since I've been an EPA employee, the businesses I used to work for, and the industry I worked in have expressed to me personally they are very concerned for voluntary EPA programs such as Energy Star and Indoor Air Quality (radon, asthma, VOC's, etc). These voluntary programs work and have created millions of jobs (https://www.e2.org/energyefficiencyjobs/). Making buildings and homes healthier and more energy efficient protects the environment, creates jobs (millions of jobs), saves American	As in my answer to question 1, we need to be able to make ourselves more readily available to our stakeholders. The inability for us to adjust our schedules to match our stakeholders on a day to day basis is very obstructive to customer service.	I came from the private industry within the last twelve months. I've heard all my life about how inefficient government is, and I've made the jokes about government workers not actually working. To be perfectly honest, I have been blown away by the efficiency the people at EPA work and get their jobs done. I've answered two questions already with the fact that we do not have enough flexibility with controlling our own schedules. I see 8 hour employees consistently taking it upon themselves to put in 60 to 80 hours a week to accomplish their work. These are the most productive and dedicated employees I have ever worked with. A job in my private sector work that		We are reaching out to other federal agencies, but we have ongoing working relationships with many agencies already. As we see someone else in the federal or private sector working on something similar to our projects, we always reach out and collaborate.

428	427	5/3/2017	1. The procedure for sending and receiving e-mail from one's personal smartphone is tedious, cumbersome and maddening. There must be a solution available that makes it easier to access work e-mail remotely while satisfying the security concerns of IT. 2. For the subset of staff who use their government-furnished computers for tasks other than using the MS Office suite, the existing hardware is inadequate. Investing a modest additional amount of resources in higher-performance computers that include more RAM and a solid state hard drive would be greatly appreciated. 3. Ease the procedure for purchasing software (including software subscriptions) whose total value is < $500. The value of the staff time required to procure inexpensive software is often an order of magnitude greater than the value of the software itself. 4. Consider hiring software programmers to develop and maintain mission-critical software packages.	Within the air quality program, more work can be done to implement standards in a way that both improves air quality while also maximizing public health. Projects like the Detroit Multi-Pollutant pilot and the South Carolina Ten-at-the-Top project each demonstrate that this procedure is far less costly, and yields greater benefits, than traditional pollutant-by-pollutant approaches.	Continuing to fund travel to conferences. There is no substitute for interacting on a one-to-one basis with stakeholders.	Consider reorganizing the Human Resources department. It's currently understaffed and overburdened. The HR office servicing OAR is located in Las Vegas. Consider relocating it to either DC or RTP (where OAR staff actually work).	1. The procedure for sending and receiving e-mail from one's personal smartphone is tedious, cumbersome and maddening. There must be a solution available that makes it easier to access work e-mail remotely while satisfying the security concerns of IT. 2. For the subset of staff who use their government-furnished computers for tasks other than using the MS Office suite, the existing hardware is inadequate. Investing a modest additional amount of resources in higher-performance computers that include more RAM and a solid state hard drive would be greatly appreciated. 3. Ensure that every EPA-developed or funded software package is open source. This is currently not the case--for example, the	Working more closely with the Centers for Disease Control and Prevention to ensure that EPA and CDC are not duplicating efforts--particularly as it relates to techniques and tools to characterize the health benefits of improving air quality.
429	428	5/3/2017	As a timekeeper I am greatly impacted by the payroll software (PeoplePlus DOI) that seems to be outdated and not unable to adequately meet the needs of our agency. This causes all types of inefficiencies such as an inability to fix issues locally (tickets are required but often ignored), requested audits take almost a year, leave bank isn't and apparently can't be coded properly causing all types of problems. Policies require employee's time to be submitted prior to end of pay week causing a high percentage of amended timesheets due to site charging requirements. System closes down three days for processing but does not lock employees out causing problems (delayed pay) when employees accidentally reopen timesheets. Other systems we use seem old and have similar issues. We have workarounds for most of the inefficiencies but would be better if systems were updated and worked well because workarounds use more resources and take more time.				New fax technologies. Right now we have no way to receive or send faxes except from a few public use copiers in the region. I am surprised we still have the need for fax capability but we do need a secure way to receive faxes when needed.	

AMERICAN OVERSIGHT

	I
428	Because our EPA-provided computers are so craptacular, we've purchased our own personal laptops to do our work. So, maybe everyone who is doing more than writing memos or developing powerpoint slides should take the same approach?

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
430	429	5/3/2017	Approval to engage with our stakeholders is unnecessarily burdensome. We need more meetings and conferences with stakeholders,not less, so I would like to see encouragement from this Administrator to engage all of our stakeholders EPA-sponsored meetings have been very successful in the past, and I hope that we will be active encouragement from management, and approval of meeting requests, to improve our ability to meet our stakeholder's needs. Engaging with the regulated entities provides EPA with insights and ways to reduce unnecessary burden.	Better environmental results will come from a partnership on improved environmental monitoring and sharing of data. Continue the dialog with the states, tribes and local communities that we already have. Continue the collaborative conferences and meetings that remove communication barriers and allow us to better understand the state, tribal and local communities needs and what works best for them. These partners have been tremendously helpful, but removing these opportunities is a detriment to achieving better environmental results.	Better customer service includes better communication and access to data we have that is submitted by states, tribes, local communities, and the regulated community. Our data is open for the regulated community and others to see and to use, not merely as a repository to meet a requirement. When the data is seen and used, errors can be found as well as cost-cutting ways to manage the data. Electronic reporting is a huge burden reduction for everyone as well as a process for improving the quality of the data, which then creates less false alarms and additional burden for the reporters.	Collecting better monitoring data, not less, will allow us to understand where the most serious issues are so our resources can be devoted to those. Engaging citizen scientists can fill the gaps in monitoring where EPA and the states are unable to provide it. Providing better access to our data, as well as improving the ability for others to find, understand and use our data is critical to making sure we are focusing on the right issues with the right amount of effort. Less data creates uncertainty as to where to focus our efforts, as well as follow-up monitoring to makes sure any corrective actions of any type provide the desired results.	Data analytics is being adopted slowly, and should receive more encouragement and funding. This is also question for the scientists and engineers in ORD who work on cost-effective pollution control technologies.	This has been occurring for decades at EPA, but due to the different missions and authorities of the federal agencies sometimes this goal has been difficult. Agreements should be made based on a core set of needs from each agency that all can agree with, while encouraging additional agency-specific requirements to be met.
431	430	5/3/2017	I can't think of any major ones. Most requirements and management procedures are focused either on increasing transparency or accountability. Those requirements reduce efficiency, but we've had to make that trade off in the past.	EPA should focus on desired results and minimum standards in regulations, as opposed to prescribing methods or techniques for achieving them. Alternately, we could give regulated entities the choice to follow a defined prescriptive path or a performance goal path. Either path would be considered an acceptable way to follow the requirements of the regulation.	Support and develop approaches such as E-Enterprise (https://www.epa.gov/e-enterprise) and e-Manifest (https://www.epa.gov/hwgenerators/hazardous-waste-electronic-manifest-system-e-manifest). If we make compliance easier, we can reduce the regulatory burden without having to get involved in contentious regulatory situations. Continue to invest in our relationships with the Environmental Council of the States and the Environmental Research Institute of the States. Use third-party arbitration approaches to help us resolve conflicts and minimize lawsuits.	Yes, we can enhance our scientific research and technical support capabilities to serve as an efficient shared resource for all 50 states. This would keep the states from having to recreate these capabilities on their own, which increases overhead costs and duplication. Under this approach, grant funds could be focused on implementation, instead of recreating the scientific foundation for decisions.	Please see remarks regarding E-Enterprise and e-Manifest in Q.3.	As mentioned in response to Q4, the more EPA serves as a central clearing house for environmental research and technical expertise, the better we can share this responsibility with the states. This approach also helps create a shared understanding of the relevant science, encouraging EPA and outside parties find common solutions to areas of shared responsibility.

AMERICAN OVERSIGHT

	I
430	Electronic reporting reduces regulatory burden, improves data quality, transparency, and access. Working with all stakeholders to help them find, understand and use data that the taxpayers and regulated community fund. We should expand our use of data analytics to find pollution prevention opportunities and provide incentives for companies to improve environmental performance.
431	I have worked in the private sector, non-profit sector, and in state and federal government over the last twenty years. The EPA is currently one of the most dysfunctional places I've been because it is not following essential best practices common to these fields. All of these best practices are inter-related: 1. Transparency- Frequently, the EPA staff are surprised by important management developments or decisions and do not know how to react. We learn about significant changes in policy from the newspaper or television and do not know if the changes are real or how they will be implemented. Increased transparency would help people know how to make decisions,

432	431	5/3/2017	We have several time keeping systems. We only need one.	As a former state employee, there is a good relationship between EPA regional offices and the states. We need to increase opportunities for communication to go from the regional offices and states to the programs. Often situations at the state level can be resolved with EPA at the regional level, but the programs intervene and slow things down then take away regional office ability to meet the needs of the states.	Put more faith in regional office capabilities for regulatory decisions and let the regions coordinate without having to go through the program offices.	Yes, contractors cost twice as much, take twice as long and have half the quality. Our labs can do our own analyses with better quality control. Our field sampling staff can innovate faster and respond faster to situations on the ground without having to go through the contracting office.	We are already working on integrating cloud computing to our operations. We need to allow our staff with expertise in these fields to work with other executive branch departments to create one system that works for timekeeping and asset tracking.	We are already working on integrating cloud computing to our operations. We need to allow our staff with expertise in these fields to work with other executive branch departments to create one system that works for timekeeping and asset tracking. There is also a lot of training that is common between departments that could be shared.

436	435	5/3/2017	Requiring paper deliverables is outdated. Electronic submittal should be the new norm. Fast track implementation of regulations requiring electronic deliverables, such as RCRA eManifests and CWA electronic reporting.	Sharing compliance and enforcement date with states, tribes, and locals in various media (air, water, and land) is critical to achieving better environmental results. Electronic data sharing via internet would make this communication possible (see answer to Q1).	Post inspection reports and enforcement actions to EPA's web site. Have a search engine on our web site that actual works.	Move away from paper and to electronic deliverable/receivables. Have a robust and working web site.	We should adopt existing technologies and drag the Federal Government into the 21st century.	We should stop wasting time on plans and EOs that are not realistic and will not come to pass. When a budget has been passed through Congress and signed by the President, then we should spend time on planning and executing those plans. Until then, all that time spent by management and staff is wasted on ideas that have no basis in reality.
437	436	5/3/2017	Office of Policy seems to be a duplicative office considering each AA ship has a similar office.		Town halls for AAs and RAs.	1. Combine offices that have similar responsibilities, FFRRO and OSRTI. 2. Incorporate Contracting Officers and Attorneys into program offices.	Expand our current GIS capabilities and create a GIS office.	Cancel EO 12580 If we consolidated remediation programs from all the Federal Agencies into EPA it would cut out numerous billions of dollars of duplicative jobs. EPA has the CERCLA law the EO allows other agencies to use it.
438	437	5/3/2017	Clamping down on our ability to put regulations out for public comment and to the docket severely restricts our productivity, sets us back multiple quarters, and angers registrants.	We are very transparent in our actions and I feel we do a good job staying in tune with our partners.		We use way to much paper here at EPA. Some people are swimming in paper inside their cubes. I feel we need to restrict access to paper waste and discourage the use of printers for every document that can be viewed and edited electronically.	Everything needs to be switched to digital. There is no reason why EPA needs paper copies.	Assignments switch so quickly between us in the office that inside and outside the office, people are confused whom to contact. Our registry databases open to the public are not updated quickly to reflect recent changes.

AMERICAN OVERSIGHT

439	438	5/3/2017	-for label amendments/notifications: receiving 5 copies of the label. Only one is needed, and an electronic version is preferred. -For child-resistant testing: submission of data requiring a full review instead of submission of a certification accordin				-Increased adoption of the EPA pesticide portal to have fewer paper submissions -Adoption of new technologies such as smartlabel and e-CSFs to move us away from using more paper	
440	439	5/3/2017	Currently, due to the new administration ALL communication needs to be cleared very far up the chain This action prevents basic web pages and other information from getting to our stakeholders and our regions. It is very difficult operating in this environment. Also using DRUPAL for web pages is very difficult takes a long time to get web information up and running Also the way things are structured if we need to reorganize it takes a long time to do this process. Travel admin is also very restricted More importantly the PPlus entry for keeping track of leave is not good. We need a better system to do this. If you are on medical leave the codes in PP do not meet the codes in Denver, so there are issues with pay. The entire PPls system needs to be revamped. There is no one to go to with these issues you have to submit a problem to HR HELP, and they close tickets without really solving the issue.	Our program secures a lot of good performance results, what is often realistic is the ACS commitment, I believe we need the ACS system to go away, projecting out performance measures ahead of time is quite difficult from each region standpoint. We need to coordinate outreach to the public and communities through the Public Relations contact but we need better collaboration with this office, we need better ways of understanding the political environments we are working in, something needs to be shared so we know the pulse more.	We uses to have open forums with the public and critical stakeholders but due to budget cuts these meetings were not continued.	Our database systems need to be updated, once that occurs they also need to talk to one another but this does not happen, often we are entering in data several times and in several places. Overall technology would go a long way in efficiency.	See above Also, need better project management tools, salesforce is terrible We need a way of managing our projects and training! Microsoft project???	We could align more with TSCA We could align more with sustainability, meaning all those that work on sustainability should be housed in one area, teams should be developed to work towards common objectives

441	440	5/3/2017	I work in OAR and have major problems with the contracts-management and -awards process. A discussion and six suggested action items follow. Over the past two years it has become increasingly difficult to get contract task orders awarded through the Office of Acquisition Management (OAM). Contracts management has never been very easy at EPA, but recently I have found that many new contracting officers (COs) hired to "fix" problems are ineffective at best, and in some cases incompetent, rude, and/or purposefully obstructive. More-established OAM personnel do not, in my experience, do anything to ameliorate situations that many program staff find demoralizing and at times bordering on toxic. The rules that COs seem to follow appear to be made up on the fly. The guidance documents from OAM that I have seen most recently, comprising information about procurement processes and requirements, processing						
442	441	5/3/2017	Everything the new "leadership" does prevents me from doing my job efficiently or effectively. All decisions are couched in secrecy for the politicals, and career staff are left out of meetings and discussions that directly impact our daily work. To address this, political staff need to recognize the value of career staff here at the agency.	Give states, tribes, and local communities more money	Give them more money and technical assistance. Craft regulations and policies that actually protect the environment, not just the economy. Stop ignoring environmental justice issues.	PRINT CORRESPONDENCE DOUBLE-SIDED - this saves money, time, and trees. It's shameful that the EPA only prints on one side of the page.	Replace the Correspondence Management System with something more user-friendly and less cumbersome. Also, instruct politicals that CMS is the process we use - stop circumventing the program offices and writing your own responses to letters without telling anyone else.	Focus on environmental protection, not economic protection. This is not the Economic Protection Agency. The Agency's purpose is not to end the "war on coal" and start a war on the environment. EPA is a public health agency.

	A	B	C	D	E	F	G	H
445	444	5/3/2017	Addressing performance issues: I have addressed performance issues within my working unit. Yet I see performance issues not addressed in other units. Performance issues with the Shared Service Center for hiring, and with the Contracting Officers for purchases affect my ability to hire a chemist or purchase a critical piece of equipment in a timely manner. I have been through the hiring process for a chemist three times in the last 8 months and was not able to hire a single person. This is a waste of my time as a manager. Lab Supplies BPA: The previous lab supplies BPA had several good companies and the bulk of the purchases made were from the BPA. The current BPA has run into many difficulties (all were reported), and we order less than 20% through the BPA. The main reasons were excessive cost (greater than 100%), and poor searches on their websites. If the BPA is not used, additional documentation is required to justify the alternate purchases. If the	If the burden remains on the states, tribes, and local communities for sample analysis, then it becomes imperative that EPA maintain a cadre of very experienced chemists who can assist with method improvements and data interpretation. Region 7 has built a good relationship between our partners and our chemists to the technological issues. It would benefit both the states and EPA if data could be shared in a central location. States could use the wealth of information for contaminated areas to be used for their targets and enforcement. New approved analytical methods: some of the older methods need revisions. New methods should not use the most expensive equipment because most states and local	The best customer service comes from people who live in your community and understand your needs. I hear rumor that the regional laboratories are going to be consolidated into three megacenters. This will make it harder for chemists to make the connections to the state and local chemists who need our support. The regional laboratories generate the bulk of the sample data used for emergencies, SUPR site removals and responses, and for enforcement. Removing the chemists from the project managers will not allow chemists to assist with project plans using the right analytical methods for the selected site.	Increasing capital equipment budget for the laboratory. Over the last 10 years, the budget has decreased while instrumentation costs have increased. EPA regional laboratories have old instrumentation. The new instruments do have more automation and use less hazardous solvents as compared to the old instruments. Higher initial investments on the capital equipment side would see reduced staff time and reduced costs for hazardous waste disposal. These reductions would outweigh the initial costs for the new instrumentation. Because the laboratories do not have representation at headquarters like the programs, our capital equipment budget is usually	Electronic Sample Data Records: Currently, laboratory data is generated on paper and saved as records on paper. When one small laboratory generates over 150 boxes of paper a year to produce data for enforcement, Superfund activities, and emergency responses, this is a costly effort. Currently, many of the attorneys are stuck on the paper record. Analytical data is generated electronically, could be reviewed electronically, and could be stored electronically. This would significantly reduce the costs of data storage and improve data retrievability. Single Data Base: Currently, responses for FOIA requests need to have data searches in over 15 distinct databases.	Currently, the chemists at federal agencies in the Kansas City area are sharing the experience and knowledge through once a year or twice a year meetings. In developing this relationship, we could be in a better position to respond to emergency situations. One such event (Overspray of dicamba in Missouri) could have been improved by better coordination between FDA, EPA, and the state of Missouri.
446	445	5/3/2017	Property Management Officers have been greatly hindered in their work due to lack of barcode scanners. Each physical location has property management staff on site who have been forced to manually enter decal numbers into the required Agency property system. FIMFIA requires annual physical inventory of every decaled item. Barcode scanners were promised several years ago when new Sunflower system was pushed out. Still no barcode scanners available to most locations. Most property managers hold a number of other job assignments - having barcode scanners would great improve efficiency and accuracy. Thank You.					
447	446	5/3/2017	Multiple passwords. EPA specific software should all use the same lanID and lanPW. I should not have to enter my ID and PW multiple times when moving around within the EPA system of software.	Meet with them and understand their concerns. Work with them and include them in my work.	Listen to their needs. Learn to listen.			

AMERICAN OVERSIGHT

	I
445	The EPA Regional laboratories are more closely working as a network over the last couple of years. In this manner, when a large event occurs, chemists from multiple regions are used to accomplish the work of the agency. For the Region 7 chemists, their focus is on "green" analytical methods with high automation producing high quality data. Remote data reduction would be one of the needed items to improve operations within the laboratory.

	A	B	C	D	E	F	G	H
448	447	5/3/2017	Credit hours tracking -The process was developed before our payroll system had the ability to include credit hours. Credit hours can be reported to People Plus now and thus should not be required to be tracked outside in a separate spreadsheet and submitted every two weeks. Traveling - Concur system should issue all EPA official travel to include TSA pre-check or equivalent. EPA staff would then be assured expedited processing at airports and therefore could arrive at airport at later time resulting in government salaries savings. Additionally, this would put less burden on TSA, which is now screening government employees on government sponsored travel that are not a treat to national security.			Contracting Officer (COR) training is somewhat irrelevant to EPA's mission and tremendously burdensome. Process needs to be streamlined.	We are still writing inspection reports old fashioned way. Take notes in notebook and then write report. Seems like we could have a more streamlined approach.	I think it would be good to provide more opportunities for EPA employees to be embedded for a few month assignment into to state/local agencies to see what they do and how they do it.
449	448	5/3/2017	Most every administrative and management process is a vestigial tail from the 1970s. Paper documents often dominate over electronic documents. Eliminated paper documents and switch completely to electronic.	Minimize interactions and let States, etc decide what is best for their situation.	A centralized, uniform response to inquiries from states should be implemented. Region specific responses leads to confusing and contradictory implementation of	ORD: Eliminate all post-doctoral (Post-Doc) training opportunities. These scientists in ORD, are by definition, directed to NOT perform Agency directed work. This wastes FTEs as well as research effort.	1) Implement modern (and transparent) accounting 2) Move from Microsoft (i.e. Windows) based computing and software to cloud (i.e. Chromebook) 3)	Clearly define lines and reduce duplication.

AMERICAN OVERSIGHT

450	449	5/3/2017	1. Information Collection Requests (ICR) - are part of the Paperwork Reduction Act, but is cumbersome, imprecise (hard to estimate), and takes up considerable EPA time and resources. The form is complex, the process is outdated as it mandates hardcopies and the use of CD-ROMs, and it is required if collecting information from 10 or more people, which is a low bar. The form could be simplified, requests fully digital, and number of people necessitating submission could be increased.		1. Public Engagement - Our mission is to protect human health and the environment, though a lot of information we produce and work we do isn't communicated or doesn't reach the public. There could be better partnering with non-profits and communities.	1. Personnel Structure - I am a GS-9 doing the same work as GS-13 and GS-15s in my branch; that is, our day to day job responsibilities are the same in practice (and frankly, I believe I take on more responsibility), though their PARS might be worded differently. I have heard this almost across the board from the newer cohort of employees. It seems cost inefficient to have a GS-15 doing work a GS-7 or GS-9 can do. This speaks to the nature of our government system, based less on performance and more on tenure. 2. Contracting - It seems due to the nature of politics, there is focus on reducing size of staff, but reports suggest this means more work is outsourced to contractors, who charge an	1. Technical Employees - There is a significant shortage of computer/tech experience at the agency, particularly computer programmers. All our main databases such as ICIS-Air and ICIS-NPDES along with ECHO are oracle based, and require complex programming which is contracted out to the likes of Booz Allen and others for 10+ million a year. That money would go to much better use and the product a higher quality (since they would know likely be closer and learn the content) than if contracted out. The challenge is retaining these technical employees because they can earn much more as contractors or in private industry.	
451	450	5/3/2017	The increase in the number and fluctuation of political appointments has created a significant amount of extra time and effort to complete routine agency actions.	Ask states, tribes and locals what has worked already and what can work better. Don't assume that the prior Administration did not have any effective partnerships.	Maintain open communication and transparency.		Utilize SharePoint more broadly to reduce paperwork and increase timeliness.

453	452	5/3/2017	Redundant oversight by OP in the rulemaking process and the rule package signing process. Do we really need two different Divisions in OP to do this? The procurement process at EPA is moribund. Not a single procurement supporting our programs is issued on time. Staff turnover is very high, and procurement managers are ineffective. Sad. HR service centers are woefully understaffed and undertrained. They are not capable of meeting time-related performance targets, and don't communicate clearly and consistently with hiring officials or applicants. This results in discouraging otherwise highly-qualified and highly-coveted applicants, who end up looking elsewhere for employment. Very sad.				We lack a system for nationally tracking state-issued air pollution permits under PSD and Title V. Regions provide inconsistent oversight of state programs and actions. A national data system that states or Regions would be required to report to would help ensure companies with sources in multiple states get consistent and fair treatment from all permit authorities. Invest in a national data system for submitting, tracking and processing air pollution State Implementation Plans (SIPs). States complain that EPA Regions do not provide timely service on submitted SIP actions. A national data system would provide centralized tracking of workflow, and help manage	All air pollution-related permitting on federal lands and the outer continental shelf should be consolidated within EPA (not split with BLM).
454	453	5/3/2017	"Bean counting" in order to meet projected results for Congressional reporting is out of date and creates busy work/enforcement for the sake of a bean instead of enforcement for the sake of addressing a real threat or release of chemicals to the environment or human health. Instead of generating yearly projected enforcement cases, I would focus instead on reporting the environmental/human health impact driving the enforcement and then follow up with the improved environmental/human health outcome from completed/resolved enforcement, i.e., pounds of pollution current released followed by pounds of pollution reduced; emergency personnel being uninformed about potential chemical releases from companies failing to file forms followed by communities being protected from potential releases of chemicals through proper reporting by companies; and potential number of people/communities receiving contaminated drinking water followed	Similar to above in that if EPA started reporting outcomes of collaboration or consultation with states, tribes, local communities or the private sector instead of focusing on enforcement results, I think that would provide an incentive to do more partnering over enforcement. Enforcement would be reserved for those situations where it is really needed to achieve the desired results.	EPA overall must do a better job of working cohesively as One EPA instead of presenting a stove-piped front to the public and our state and local partners. This starts with different program offices within EPA working together to understand how all our programs intersect. Even now, enforcement by air, RCRA, and SF against the same company do not coordinate. I think the public and regulated communities find this confusing and frustrating.	Yes - EPA does a poor job of prioritizing enforcement. For instance, in my Region, cases are brought against companies for violations of filing forms years after the violation occurred, and despite the fact that the companies have returned to compliance within months of the violations having occurred. This kind of enforcement is encouraged as a way for the Region to meet its "bean" commitments, and it does not result in any greater protection of the environment or human health. It also takes staff time (both program and attorney time) away from focusing on addressing through enforcement or counseling, those environmental and human health issues that are truly	Yes - EPA should employ an app that can capture and store text messages among employees and between employees and outside parties. Texting is a particularly important, effective, quick and easy form of communication during emergency situations (i.e. spills into drinking waters supplies), and the agency's current policy for capturing text messages to preserve them as records is very cumbersome and inefficient.	Two easy areas for realignment are to allow HUD sole enforcement of the lead disclosure and lead paint rules, and allow ACE or EPA the sole responsibility for wetland enforcement, not both.

AMERICAN OVERSIGHT

	I
453	
454	I recommend focusing on mediation and providing compliance assistance more as a way to reduce enforcement costs. Enforcement should be reserved for the more egregious cases where compliance assistance and/or mediation do not produce positive results.

AMERICAN OVERSIGHT

455	454	5/3/2017	HQ should allow the Region to serve its constituencies; oftentimes an edict would be imposed that does not serve the communities in our region. We know our region better than anyone. It goes to accountability. All the Region to take action and live with its outcome. Whether the outcome is good or unfavorable, empowerment. That's how government becomes better.	Communication, timely involvement and recognizing the added values.	communications in the process	Accountability on all performance measures and consequences for not meeting expectations; career employees are under the mindset that they cannot be reprimanded, or terminated for non-performance.	Yes, we take perfectly good computers, wipe all the programs off and reinstall the EPA image. What a waste of time and resources. Stop that practice. We have networks and other security controls in place where this practice is just over kill. I like having the IT resource center to help with solving solutions regarding desktop programs.	Let folks do what they do best and when they need to come together, with other federal agencies, states or tribal governments, polish the finished product together.
456	455	5/3/2017	the rule development process is still cumbersome. Steps like Analytical Blueprints for many tier 2 or higher rules end up developing formulaic products and are more or less check boxes to fill. In particular, there's an imbalance of power in these pre-rule stages, with the lead office often restraining options and not really taking input from other offices seriously.	Greater use of pre-rule vehicles like ANPRMs, or more casual, issue-focused fora like one-time roundtables on topics. These can be balanced so that there is genuine exchange of ideas rather than chanting back and forth about fixed positions. Also, more issues should be run through FACAs, which are by law balanced and capable of giving consensus advice. While you folks will not want to hear it, a good model was the prior administration's outreach in the development of the Clean Power Plan. You may not like the results, but the effort was there, and many issues were at least raised if not worked out.	Maintain strong regional offices that are closer to the states and the public than DC. Air more issues before documents hit the federal register (rules, proposals). Make the notice and comment process more useful to outside groups by soliciting comment on multiple options rather than rifle-shot proposals.	Writing more flexible, multi-option proposal will reduce the need to reopen and reconsider rules and accelerate the rule development process. The period of 2001 - 1017 saw a big growth in the number of reconsiderations because we were too restrictive in our consideration of options in our proposals. This led to 4 FR notices for many rules rather than 2.	More use of video conferencing when conducting outreach during policy development stages.	Create more issue-focused working groups across agencies. These would not have rule-writing authority, but would ensure more coordinated policy development.

AMERICAN OVERSIGHT

	I
455	IT should be in-house. If we are going to adopt the Telework model then cubicles need not stand empty for days at a time. Create shared divided bull pens and smaller conference rooms for those needing conference calls, or consultations., etc.

457	456	5/3/2017					In acquisitions, the contract writing program (EAS) does not interface with the financial system. This means even though the funds have been obligated in EAS, the transaction doesn't get processed in the financial system until we email a copy of the contract or modification to RTP and someone there manually obligate the funds. Not only is this an antiquated and inefficient process, it also greatly increases the probability of errors. Along this same line, if we had a financial interface, we could process invoices electronically through a system like the Treasury Department's Invoice Processing Platform (IPP). They allow other departments/agencies to use	
458	457	5/3/2017	Within the Criminal Investigation Division (CID), special agents have recently been instructed to use a system called CaseMap. CaseMap was introduced in 1998 as relational database software for law offices to store and retrieve evidence and sources of evidence in litigation. The CaseMap website is a sales pitch for law firms, it was not designed for special agents to conduct their investigations or a means for them to store data. The training provided on how to use the system costs money and after receiving it, agents are still not left with a solid understanding of it although they have a GS-14 helping manage it. To my knowledge a survey nor study was done to determine whether or not DOJ, other federal agencies, or the agents prefer this system. In the conversations had with other agents, DOJ nor the agents want this system. In addition, other law federal law enforcement agencies don???t use it. I	Within CID, there is and has always been a big push for liaison with our counterparts. A majority of the investigative leads come from those counterparts asking for assistance. In my experience CID has a tougher time from our own civil enforcement not wanting to share information.	Keep doing liaison with our counterparts and the public.	CID should be run as a law enforcement group. Unfortunately, CID falls under OCEFT then OECA and too many times our upper management comes from the civil background with no true understanding of how a criminal investigation is conducted or how to run a criminal division. CID should be moved out of OECA and OCEFT and placed under the administrator as a primary office. This would allow for restructuring to eliminate or reduce unnecessary layers of departments and inefficiencies.	CID has a case management system called CCRS. It is dated, but it functions as intended and agents know how to use it. There were talks to upgrade CCRS at the cost of 1-2 million and an employee was even hired to further that effort. However there have been no major upgrades Since the system is working and agents can use it as intended, upgrading CCRS should wait until there is a better understanding of the budget.	EPA-CID agents receive specialized training above and beyond title 18 investigations and we have a specialty skill that other federal agents and agencies don???t have related to environmental crime.

AMERICAN OVERSIGHT

	I
457	Generally, agencies base the ceiling amount of a Contracting Officer Authorization (COA aka Warrant) on the stated needs of the office requesting the warrant. Recently the Office of Acquisition Management (OAM) changed the way EPA issues warrants and based the ceiling amount on the grade of the Contracting Officer. That change made warrant amounts arbitrary and seems to prevent individual contracting offices from being able to fully function.
458	

AMERICAN OVERSIGHT

459	458	5/3/2017	Databases: Concur, People+, FPPS are all cumbersome and don't communicate with each other. Changes need to be made to make them more useable. For example, there is no way to track awards in FPPS. The leave slip process in People+ is ridiculous. Also, the position of the Administrative Assistance needs to be revisited because the needs of that position have changed. Seems like there is not enough work for some and way too much for others. There should be a fitness for duty test because there is no retirement age requirement. It is sad to have to go through the removal process when someone has been with the agency for 40+ years but doesn't realize that they cannot do the job any longer. Even when management goes through the removal process, the MSPB often delays any action for months, to sometimes years. While this isn't a frequent issue, it takes a lot of time from the manager. Also, hiring freezes do not help the agency. The last hiring brought in capable, young people who will be with the agency for a long time unless	EPA has done a great job partnering with states, tribes and local communities, and in some cases the private sector. We provide funding through grants to help states and tribes develop programs. We have developed training for states, tribes and other federal agencies; conducted joint site inspections, and presented together to the public. Knowing your state, tribal and federal counterparts is key to establishing those relationships; we need more opportunities to do that.	Let us do our job and the public benefits. EPA is implementing laws created by Congress but it seems some feel each individual staff member has written a regulation for personal gain or intent. Having enough staff and resources to travel to states/tribes in the Region or to give presentations or meet with the public is necessary. Showing that we apply laws and regulations consistently across sectors is important.	Fix the administrative inefficiencies as noted above.	See above, better databases for administrative actions and tracking.	Reducing the number of Regions is not an effective way to provide assistance to states, tribes and the public. Regions cover several states and the questions above about providing improved customer service to state, tribes and the public would be reduced. There are programs at EPA that used to be critical but have either played out or are not an issue anymore. These should be identified and staff used where resources are necessary.
460	459	5/3/2017	There are no "institutional" processes in my direct organization inhibiting my ability to do my job efficiently and effectively. Overall, however, the overlap of EO's, circulars, guidance or regulations, etc., can make things difficult. Often like too many doctors prescribing too many different medicines for one patient. Individually the medicine might make sense, but piled on top of many others they can be harmful. Like evaluation of individual patients, various requirements should be assessed periodically for individual programs, or duties, to evaluate the practical effects of all of the applicable requirements applied as a whole. This would have to happen on a pretty low level, however, which is too complicated and take too much time for any given political cycle to get behind. Even though would be a huge help in helping us do our jobs better.	Environmental results from partnerships happen when there is a vested self interest; otherwise, profits, and short term priorities always win out over longer-term environmental results. How do we create or appeal to those self-interests is always the question. In my experience it comes down to the tried-and-true "walk softly, and carry a big stick," and lots of money. That almost always means regulation, and grants or incentives. Since the environment is a public good, but the "rational actor" is only about their own self-interest, so regulation or incentives become the prescription to make environmental protection relevant to the self-interested.	As public servants our jobs are about implementing regulations and policies. While they may be partners in our implementation efforts; states, tribes, local communities, regulated community, and the public at large should not be viewed as customers of the federal government. It's not a market-based relationship. So, the #1 thing would be to stop considering those outside the agency as customers, instead consider them part of a network for the implementation of policy and regulation.	Even good regulation on top of good regulation can "gum" up the works after a while. A purge once in a while would be beneficial. However, every regulation at some point had a reason. Before regulations are purged there must be an effort to take stock why it was enacted and whether it's been effective. If the reason no longer exists, or if the regulation hasn't been effective (however that is objectively measured) then it could be eliminated. This is not an easy task and would take a long time. I don't have confidence that there is ever the will to eliminate regulations with such forethought, but in the long run would increase efficiency and effectiveness.	More flexibility for staff to identify and access software we feel would help in carrying out our jobs. Right now it is very difficult to get authorization for software that isn't "standard" for our agency so we do without and this can be very inefficient.	First is to identify what those shared responsibilities and interests are in law and practice. Without knowing that there is no way to make improvements at the margins. Which is what this questions seems to be getting at.

AMERICAN OVERSIGHT

	I
459	Treat employees with respect so they feel empowered to do their jobs. The public sector is different than the private sector, I've worked in both. And although there are similarities, the difference is that most EPA employees believe in the mission of the agency and want to feel like they are contributing to a better environment. Awards and recognition is nice but most do not believe those are necessary if they are allowed to do their job. Having educated, experienced, motivated employees is the best way to increase efficiency, effectiveness and reduce costs. Workplaces like Google and Facebook have also shown this to be the case.
460

	A	B	C	D	E	F	G	H
461	460	5/3/2017	Admin-type duties and paperwork related to travel, time keeping, etc. I'd address these by hiring additional administrative support.	Continue an open dialog with states, tribes and local communities. We already work well with our states. We rarely have the opportunity to interact directly with industry (not sure why that is). Communicating directly with industry representatives would help to ensure all needs are met.	Increasing opportunities for EPA to participate in stake holder meetings would help us provide better service and greater accessibility. This would require increases in travel funds.	No. I think we would all be better prepared to handle new technologies and industry advances if there was more funding available for training.	Increase network bandwidth so that computers don't get hung up when accessing things like permits or state databases. Single login for all internal sites, rather than separate logins with different password requirements for every individual site (training, payroll, records, etc). Communication from the Administrator so that we are aware of what the new priorities are, and what is and isn't "off-limits." This would avoid the time wasted speculating over whether or not we should continue the job we have been doing or if it is completely off-limits to work on science-based tasks like climate change. Running every task up the chain to our regional administrator to make a decision based on what we "think" the direction	Better communication and face-time with other federal agencies and states. Increase opportunities to discuss common goals. The administrator should clearly lay out his goals.
462	461	5/3/2017						
463	462	5/3/2017	In recent years the Office of the Science Advisor has initiated scientific reviews of scientific reports generated by the Risk Assessment Forum prior to sending the reports to the Science and Technology Policy Council for concurrence to release for public comment, external peer review or as final documents. The reviewers in the Office of the Science Advisor do not have the scientific expertise that the Risk Assessment Forum has gathered from across the agency to comprise the Technical Panels that develop the reports. This process has delayed several projects by 6 to 12 months. There is very little value added for the significant time delay. Additionally, the volunteers from across the Agency that participate in Risk Assessment Forum Technical Panels are increasingly frustrated and less likely to participate in this valuable Agencywide forum in the future.	The International Life Sciences Institute (ILSI) has a long history of bringing government, academia, industry and the NGO communities together to improve environmental sustainability and human health. Their model of bringing everyone to the table as equals to solve specific problems should be incorporated when working with states, tribes, local communities and the private sector.	Our first line of connection to the states, tribes, local communities, the regulated community and the public at large is most often our internet site. Our internet site has been problematic for many years and the recent renovation of the EPA.gov was not well thought out or executed. This needs to be a high priority and not left up to student services contractors. Our content needs to be concise and easy to find. If our search engines are not improved we should remove them and advise the public to do what Agency staff do - Google!	The biggest area I see in reducing costs and inefficiencies is to do something about the slackers who are not performing or who are underperforming. My office has several people in both categories. One of the worst examples of the latter is that my time keeper is a GS15 Program Analyst! Most time keepers in the Agency are GS 7 or 9. The curse of the competent is rampant at the Agency, those that can do the work keep getting piles of work, while those that can't or won't are left in their cubicles to waste the days away until retirement. Managers who won't do anything about the problem employees create morale problems with the hard working employees.	We need to have greater utilization of the Adobe Connect web conferencing system for audio, video and document sharing. We need to quit relying on the very expensive 1-866-299-3188 teleconferencing system. For workers who telework, we need to reconfigure office space for increased utilization considering hoteling or office/cubical sharing.	Proposal for reducing to Agency to eight regions is as follows: Region 1 - gains New York Region 2 - eliminated Region 3 - gains New Jersey Region 4 - gains Puerto Rico and Virgin Islands Region 5 - gains North and South Dakota Region 6 - stays the same Region 7 - gains Colorado Region 8 - eliminated Region 9 - gains Utah Region 10 - gains Montana and Wyoming

AMERICAN OVERSIGHT

	I
461	Communication from the Administrator. Best in Class practices include having a communicative "leader" who provides clear, concise messages and believes in the mission. When I worked in industry we had weekly or biweekly updates from the CEO, demonstrating that he was engaged and interested in the work we did, and updating any changes to the company's mission. Even though this was a global Oil and Gas operator, messages of positive reinforcement well outnumbered coverage of what the CEO viewed as negative. This type of communication and attitude helped motivate employees to do their jobs and do it well. We did not
462	
463	Increased use of telework, flexible work hours and credit hours while working with supervisors to address productivity and accountability issues.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
464	463	5/3/2017		The EPA is a more appropriate part of our government to release the dietary guidelines for Americans. The EPA's stated mission is to protect human health and the environment. The USDA's stated mission includes furthering agriculture. The USDA's industrial interest creates a conflict. The EPA's stated mission encompasses a human's largest interface with the environment. This interface is the gastrointestinal(GI) tract that comprises the greatest area of interface between a human and his or her environment. My next suggestion is to cease pasteurizing our food to death. Food preservation could benefit from embracing a healthy fermented preservation technique.		The EPA could foster cross-pollination of ideas and excitement by encouraging workers to present on interesting topics in their work to interested coworkers.	Introduce workers to and further utilize the Revision-Control-System(RCS) named git for document-tracking and quality-assurance.	Team up with the USDA to mitigate industrial interests' biasing effects on the dietary guidelines for Americans.
465	464	5/3/2017	I do not work in contracts management at this time; however, the system involves a lot of duplicative forms and processes and too many levels of signatures.	We should continue to support Brownfields, which usually result from a partnership between EPA, states, local communities and the private sector. These partnerships help turn urban blight into urban successes.	Make more information available to them on our website; for example, the pubic wants to know about climate change and what actions they can take to mitigate it.	Reduce the number of upper managers, deputies/associates, senior advisors at all levels, and special assistant GS-15s. Many of these people are overpaid, go to meetings all day, and produce no measureable output. Yack, yack, yack. They are paid a lot of money to pontificate. Why does the Immediate Office of OSCPP have so many high paid GS-14s and 15s who provide information to the rest of us on employee benefits, training, etc? Seems like a waste to me.	The Office of Pesticide Programs (OPP) uses an antiquated, DOS-based information management system called OPIN that is about 20 years old and was outdated back then. This system is a shock for new employees who never needed to learn to "write click" or constantly hit "save" before they came to work here. OPP's information management system is in desperate need of modernization.	Not sure.

AMERICAN OVERSIGHT

	I
464	I suspect it would be a beneficial practice to spur intrigue in employees' work by letting employees present to a voluntary audience about interesting work, useful tools, and exciting knowledge.
465	DOD encourages its employees to stay physically fit and provides state-of-the-art facilities and equipment. EPA's gym is a joke. Lack of exercise and increased stress leads to fat, sick employees and increased absence sand medical bills. This costs tax payers money.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
466	465	5/3/2017	We continue to be burdened with administrative procedures while seeing reduced administrative support. The purchase card program is one example. I have to get the total cost of a purchase approved prior to purchases. This frequently causes me to travel to a vendor pick out the items get a price and go back to the office and request approval. Once that occurs I go back and get the item. I then have to go through the tedious PNET approval process. Be aware that these steps were put in-place because of an overreaction to an IG audit. This is just one example of many Administrative burdens placed on technical staff. Streamlining these requirement would help, but the IG would not like it.	Working with private sector entities is difficult because everything is deemed a potential conflict of interest. It is difficult to achieve much with States and local communities due to lean budgets. Working with tribes is hit or miss depending on politics.	Our office is at half staff due to retirements and unfilled positions. We do what we can but project work consumes about 80 percent of work time. We proactively work with the States in our area by conducting training and out reach. Cleanup and assessment work takes priority. More staff would be the solution.	We have seen staff reductions and significant cuts in contract dollar support. Management within the Agency needs to try to understand where the priorities are. There are several pet projects within our program that do not protect the public or environment. We have a saying, "There are those that do response and there are those that play response." . Take a look at the underfunded oil response program (training, outreach, response equipment evaluation). Some Homeland Security priorities are a stretch.	We used to have funding to evaluate equipment developed by vendors for emergency response equipment. That funding no longer exists. Response contracts have been cut significantly over the last eight years. Response readiness is declining. A mentoring program for new staff is needed. Much technical and institutional knowledge is leaving the Agency due to many factors.	My program has few duplicative efforts with other Agencies.
467	466	5/3/2017	There are numerous procedures and processes that create a burden on employee's time but do not improve our ability to do our work. EPA offices should undertake systematic use of lean-in type exercises to uncover and correct these many inefficiencies.	Increased research and utilization of social science-informed methods for collaboration and engagement that can respond to local values and priorities. Expanded use of voluntary programs to broaden the scope of approaches used to protect human health and the environment, while also encouraging innovation.	Continued presence of Regional offices.	There are many things about EPA's internal processes for getting things done, involving multiple software systems, convoluted approval processes, and the ad hoc addition of new processes, that greatly slow down the work the agency is able to accomplish.	Have a single way of tracking products in progress, instead of separate systems that each need to be logged into for contracts, clearance, and other functions. Another solution is not just to purchase a brand new technology, but rather to provide greater instructions and context for the business solution software, webforms, and other processes that EPA already uses. There are many forms that we have to fill out, for example, that provide no instructions. Inevitably, we fill it out incorrectly or send it to the wrong person. Then we don't get the response we need in a timely manner.	While more than one agency has a mutual interest, they work on it with a clearly distinct lane. There is not a great deal of redundancy across agencies even though nominally they cover similar issues. What redundancy there is can be reduced with increased communication. It is very important that EPA continue to be in conversation with other federal agencies with shared responsibilities and mutual interests. This can be facilitated by OSTP committees and other ways of promoting peer-to-peer contact and learning e.g. at scientific and professional conferences.

AMERICAN OVERSIGHT

	I
466	Limit flexi-place to one day a week. Our group has many technical experts and scientists with years of experience. My immediate managers are technical and trust their staff . This is not the case further up the chain. Empowerment is the key to efficiency. Management for a scientific organization should be comprised of scientists. There are too many political scientists and attorneys in management positions.
467	Right now, offices are rewarded for spending all of their extramural funding. Not spending the money means it may get swept up and you will not be given as much next fiscal year. The incentive should be reversed. There should be rewards for not spending all extramural funding.

AMERICAN OVERSIGHT

468	467	5/3/2017	The Concur travel system is not intuitive and it is cumbersome to use - to the extent it could be made more user friendly, that would save many people a lot of time and could save money as well. We have improved some processes in my Office via use of Lean, which has been helpful. I also appreciate that the many required annual training courses have now been mostly synchronized such that we receive notices about them all together (rather than piecemeal) and most of them are available in one central location (Skillport) rather than multiple locations.	To the extent budgets for in-person training/discussions/conferences may be more limited in the future, EPA would benefit from increasing support in the form of webinars, pre-recorded videos, on demand training courses, and other forms of remote interaction.	Listening sessions are a good idea and it is important to have a plan for how verbal and written input will be reviewed and handled - attendees want to know how EPA plans to take their diverse views into account (S/L/T governments, regulated community, other stakeholders, public). EPA should support states' regular meetings (e.g., annual meetings) and be available in person to share information.	I am a fan of webinars - not that the opportunity is untapped, because we do provide them, but we could provide more. They are a good, low cost way to share information. The hiring process seems very inefficient, but I'm not sure what to suggest as far as ways to improve it.	More training on Drupal/web work and common webinar software (Adobe Connect, GoToMeeting) would enable more people to tackle these tasks, which would loosen up the strain on IT staff already tasked with these areas. EPA is generally far behind the rest of the world in terms of computer upgrades - hardware, operating systems, etc.	
469	468	5/3/2017	N/a	The relationship between Federal EPA versus State governments, Tribes, municipalities, and the private sector needs fundamental change. The Federal government should not impose its environmental policies within States; they are democracies and can make their own decisions and be held accountable for these policies by their voters. This is not a legal opinion, neither a self serving suckup, since this survey is reputed to be anonymous. Offices with Federal regulatory authorities should delegate their authorities fully to States and Tribes, to adopt and adapt, as they alone choose. USEPA should orient itself toward customer service and to supporting each of the 50 States and all the Tribes, at their request. USEPA employees will then aim to serve State, Tribe, and local needs as regards environmental matters.	EPA should cease issuing environmental regulations that apply within the 50 States. EPA could, for instance, instead provide health information about a range of possible exposure levels protective of human health and provide supporting information to buttress these numbers. (Supporting information would acknowledge uncertainties, sometimes substantial, associated with calculated estimates.) Regional offices could be converted into environmental assistance offices, aiming to support needs as defined and sought by States and Tribes. Headquarters offices can likewise be turned into State and Tribe support offices.	Fundamentally changing the relationship from imperial central policymaking premised on Federal primacy thru the entire nation to instead aiming to help customers in States, Tribes, counties, towns, and rural areas, could render great service to USEPA employees. It could give them more meaningful work. USEPA employees tend to have empathy for citizens and the environment. They also have knowledge and talents and tend to be laudably inspired to serve others. But many work in the difficult regulatory context of endeavoring to apply Federal environmental policy omniscience. Sometimes their efforts are very helpful, yet other times inevitably must be less so.	No technology can effectively substitute for fundamentally altering the mission of the Federal EPA from dictating to industries and towns, to instead collaborating with and helping them. The main challenge is one of responsible and enlightened governance. Technologies come and go. They are trivial, in contrast to decentralizing environmental policymaking and respecting local values and leaders.	There will be specific opportunities that will become apparent after steps to delegate environmental policymaking fully to States and Tribes is accomplished.
470	469	5/3/2017		Continue support for Local Environmental Observer (LEO) network which provides on the ground observations about unusual animal environmental and weather events. Integrates traditional and local knowledge with scientific knowledge. and Much more.

469	Ask industry groups for their ideas about how best to practice Responsible Care. Ask the private sector about best practices within the private sector. If the tone and fundamental relationship of the Federal EPA toward industries, towns, States, and Tribes becomes supportive, rather than prescriptive, then industries will likely be able to be more forthcoming about their best practices. The Federal government can transition to becoming more supportive of local leaders and State economies than is generally the case today. Thank you!

471	470	5/3/2017	The process that HQ and the Regions go through to evaluate the annual Brownfields assessment and cleanup applications could be greatly improved and it is very time consuming. The program is wonderful and it is one of the best the Agency has to offer, but the competition process needs to be streamlined. Our "FY17 Proposal Guidelines for Brownfields Assessment Grants" is 73 pages. A version of this document with modification is published annually for applicants to follow in order to submit an application. This in itself creates a huge demand on anyone applying to read and understand the Guidelines. Consultants prepare applications for the applicants because of this. The applicant must submit a narrative that is typically 15 pages of text addressing our ranking criteria. We have three reviewers from across the regions reviewing each proposal and then painstakingly evaluating each one. Hours are spent on this from January to March. It is not just the number of reviewers that is the issue, it is all of it,	Let the states have more flexibility in their implementation of the 128(a) state response program grant funding and also make it easier for them to get their annual funding!! Significant time is spent by the state in preparing the same documents each year and EPA in reviewing those documents. You should just have tiers of performers, so for states performing well, they just need to supply the basic and get additional funding each year. Also HQ requirements are much too stringent for state 128(a). HQ focus is on the four elements in the statute rather than the actual response program work. HQ guidance states "The primary goal of this funding is to ensure that state and tribal response programs include, or are taking reasonable steps to include, the elements of a response program and establishing a public record.??Â But the statute says	Keep giving them funding that they deserve to improve their communities and address the contamination that no one else is going to address	Yes, see above. Also please expand the travel budget so we can once again do the needed outreach to these communities.		
472	471	5/3/2017	A more flexible workplace would be helpful, with employees measured by their ability to produce timely, high-quality work (not necessarily within a pre-established 8 or 9 hour day). My experience has been that colleagues are extremely competent and committed to good work.	We already have several processes in place to engage the public (through public comments) and the states (working through our regional structure). Some tribes don't necessarily get the protections they deserve and, unfortunately, we don't always honor tribal treaty rights (for higher-quality air and waters) as much as we should. Working with the private sector through accreditation programs like Energy Star, WaterSense, and Vehicle Emissions ratings, are good examples of how we already work with the private sector.	Develop user-friendly apps so that our customers can track important processes (e.g., rulemaking) and so that customers can also better understand the breadth of EPA's work.	Most employees are reasonably paid a select few are over-paid. For example, I know an employee in AO/OP/ORPM/RMD whose salary increased from GS-9 in 2007 to GS-15 in 2012. When you consider that those increases took place throughout the economic recession years, it's quite remarkable. As a result, she is a non-managerial GS-15, doing essentially GS-9-level work. A review of promotion decisions for cases like this (full-grade increases for four consecutive years under otherwise fiscal austerity) is warranted and corrections should be made, if possible. The agency could save a lot of money by reviewing non-managerial GS-15 positions and positions whereby the staff rose through the ranks literally as fast as legally	A greater use of video conferencing and collaborative tools, like WebEx, can help to bridge the slight gap between EPA headquarters and staff in EPA regional offices.	Review GAO reports on duplication, overlap and fragmentation. To the extent that any programs relate to EPA's mission -- protecting human health and the environment -- consider inter-agency partnerships with other agencies working in those program areas.

	A	B	C	D	E	F	G	H
473	472	5/3/2017	eliminate the ADP tracker! Most of the items being tracked are normal everyday business that shouldn't need to go to the administrator. I mean really, does he really want to know about all the PSD permits???? As a region we have the opportunity to review over 600 permits a year!! And seriously... SIP compilations??? It's just sending all the things we've already approved for the past 3 years to the Office of Federal Register!! Why would that be something worth tracking?? The ADP tracker is just one more tracking spreadsheet that we have to update and keep on top of... I swear I spent 2 hours yesterday updating 8 spreadsheets/trackers/lists on all the things I've been doing. If the administrator wants us to do our job more efficiently, then let us do our jobs, we know what we're doing!	Achieving better results starts with the ability to use every tool in your tool belt both good and bad. That means being able to threaten states when they tell you they're not doing something, when the administrator says we're not going to use sanctions legally given to epa by congress then that's one less tool to use. It also encourages states to do less than the bare minimum because they know we don't have the spine to do anything about it. On the opposite end of the spectrum we should make quicker decisions on topics of interest and provide more timely guidance. Allowing lower levels of the agency to make	not having to go through a public relations person every time we sneeze! The roll of the pr person is to answer questions from reporters/etc, having to go through a pr person for regular business is ridiculous, time consuming, and just one more set of eyes on a simple letter that doesn't mean anything.		Allow us to use free licensing applications on our computers: For instance for internet access allow us to use things like Chrome or Firefox. Restricting us to use only one program hinders our ability to access information that's only available on other apps	We cannot accomplish more by giving states more responsibility or delegating programs down to them. States are already financially strapped and when they do take control of a program epa is required by law to oversee their work. The best way we can accomplish more is by requiring states to increase their fines and penalties for environmental violations... by doing this the states will be able to take on more work and the consequences for violators will swing from worrying about epa to worrying about environmental harms they can avoid
474	473	5/3/2017	Lack of communication between the political leadership and rank and file. A lack of direction and communication is making the agency ineffective. Address the staff, share your plans, publish the administrators speeches, let the staff know what your expectations are. Staff shouldn't learn about internal decisions from the press. Clearly articulate to managers and staff what is expected. The agency needs to address timekeeping systems. In region 7 managers have three systems to monitor (four if you include telework requests). We waste hours on basic administrative tasks. The agency needs to provide one-stop shops for staff and managers on all administrative systems. If I have a question about my pay stub, I should need to understand if it is an OCFO or an OARM question. I need to be able to go to one place and quickly get the answer. We need to become more mobile. We	Process Improvement is a very effective tool in mapping out roles and responsibilities.		Streamline administrative processes through Lean. Hold senior managers accountable to implementing changes.

	A	B	C	D	E	F	G	H
475	474	5/3/2017	The contracts situation at EPA is a nightmare. There are constant hold ups in OARM because of lack of contracting officers. Please let them hire the staff they need to address the back log or someone should work to revamp the contracting procedures at EPA, in the federal government or wherever so that we can get contractors on board more easily and swiftly so we can get our work done in a more timely manner.				Yes! EPA does not appear to have an agreement with a program/software that can help us easily make infographics, flyer layouts and other graphics for use in house or for outreach materials, announcements or rulemakings. Last time we asked OPA they said they did not have any intention to obtain an agreement. GSA has a negotiated terms of service agreement with Piktochart (see https://www.digitalgov.gov/resources/negotiated-terms-of-service-agreements/) but we were told that we cannot use it without EPA also having an agreement with them. It would help our job in communications to have access to such a program so that we can easily and quickly do some graphics in house instead of sending them out	
476	475	5/3/2017	Using the PeoplePlus system for Superfund site code charging is cumbersome and laborious. It takes me 30-60 minutes to fill out my e/o week timecard. (If you multiple that by 1,000 employees 26 times a year => that's a lot of money/time). I feel like some changes could be made to streamline the process. ADDRESS THIS: By hiring a consultant to streamline the process using the systems we ALREADY have, develop guidance and training, and implement the change. Taking poorly designed mandatory training . I learn little and it takes up time for each employee. (The largest most horrible example is the contracts officer representative training that occurred in 2016-2017. Most of the content/process described were NOT relevant to most COR activities. I realize the Agency is trying to save money by using other Agency's training, but if the content /processes are NOT relevant, than you are wasting time/money at a very high level.) Managers are pushing	Allow EPA employees to travel more to create "opportunities" to convene these partners. Have appropriate grants to involve states, tribes, and local communities (like EJ Grants or State/Tribal Cooperative Agreements). When grants can be too cumbersome, allow the Agency to create contracts to serve such needs (like EPA's Superfund Redevelopment Initiative or the former EPA CARE Program). Allow the Agency to serve food at these events (nothing helps build relationships like "breaking bread", which is why the President hosts meals during important meetings). Continue to fund and promote programs that push for collaborative function, like facilitation services from EPA's Conflict Prevention and Resolution Center and technical assistance services from EPA's Superfund Technical Assistance	Hire social behavioral scientists at EPA. Bring back the climate adaptation team. Create more opportunities for EPA staff to share lessons learned and best practices within the Agency (across programs and regions).	Cultivate better first-line supervisors. ADDRESS THIS: By creating a group of EPA "consultants" to work to improve the effectiveness of first-line supervisors. Better process for awarding contracts. It seems that we are awarding contractors who bid the lowest, not the ones to can do the right job (most effective and efficient). This would greatly reduce inefficiencies by not having subpar work that EPA employees need to improve.		Invest more in those relationships by building EPA staff competency, supporting travel, and supporting mechanisms to build competency within our states and tribal partners. Allow EPA to host conferences, workshops, etc. to convene those critical conversations.

477	476	5/3/2017	1. Way too much time is spent having highly trained scientists and engineers having to do episodic administrative work. Much greater efficiency would result by having dedicated administrative staff perform these tasks. 2. Eliminate many procedures. Instead, hold people accountable for being good financial stewards. 3. Streamline the performance evaluation system. PARS is so broken that it is useless and counter-productive.	1. Give grants to local communities to hire their own experts to advise them on cleanup issues. 2. Simplify EPA regulations and guidance. We produce way too many verbose reports written by contractors that no-one ever reads let alone comprehend.	1. Recruit new staff to perform these duties. Bring in more scientists and engineers who know how to communicate.	1. Eliminate matrix management for research in ORD. This has doubled the size of management and high positions without any real benefit. Eliminate Title 42 positions for National Program Directors. 2. Make the polluter pay for Superfund cleanups. The easiest way to get better leverage to accomplish this would be not to allow the polluters to conduct self-serving studies that downplay the extent of contamination and risks. Have EPA do all the site investigative work and then negotiate with the polluters to cleanup the site. This would save the government lots of money in the long term. 3. Simplify all regulations. To do this, you need to bring in new EPA managers for each	1. Better use of video conferences instead of traveling. Too many folks still prefer to travel than work. 2. Better use of on-line surveys.	1. Clear roles. 2. Better EPA oversight using random audits.
478	477	5/3/2017	My management chain is highly supportive and helps me do my work efficiently and effectively.	I believe that OPP works well with states, tribes, local communities and the private sector.	Improving record keeping. If all interactions are kept between the Agency and the regulated community then all interactions are on public record. If people are aware that there interactions are part of the official record and open this may improve customer service. Trainings on how to provide good customer service might also be appropriate. If people are aware of what the standards for customer service are they may be more inclined to reach for them or meet the standards. These trainings should also include how to say no to customers. Saying no, is an important part of our job. Knowing to effectively and with good customer service say no is difficult and a fine line to walk.	Embracing electronic submissions of documents. Moving to a digital workflow would reduce costs and reduce inefficiencies after an initial investment.	Please work with OPP on the Smart Label project. This project is working to make our labels searchable and introduce a digital workflow. This product needs support and funding now in its infancy but will hopefully reduce costs and inefficiencies in the long run.	I believe that OPP has good relationships and shared interests with the states and other federal agencies. We should however work toward becoming more transparent with other agencies and the states.
479	478	5/3/2017	hiring outside government entities every 3- 5 years to manage electronic databases/tracking systems such as travel "concur" as this puts our PPI at risk as well as national security riscs		regular coordination meetings, training sessions on new technologies, policies etc	more telework opportunities

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
480	479	5/3/2017	Many of the systems used to manage employee activities are overly complicated. The most glaring example is business travel procedures. The amount of work required to schedule, procure lodging, flights, car, etc, and get reimbursed is obnoxiously frustrating. If it were allowed, I would pay for my own travel just to avoid the headaches. CONCUR just plain sucks, period. For whatever reason, the federal government insists on relying on 3rd party contractors to manage such things, and once these contractors obtain their contract, they are not properly held accountable for the quality of their product. Here???s how travel should work: 1. Employees are issued a travel card, 2. They charge travel expenses on the card, 3. The agency pays off the card. This seemingly simple process has become overly complicated out of fear of abuse. But, the last time that I traveled, my reimbursement forms were routed through 22 different people. 22!!	Regulatory agencies exist because regulation is required to prevent greed motivated, detrimental, runaway effects of a capitalistic society. A centralized federal agency is the best case that we can ask for from this perspective, as it can ideally maintain an unbiased, subjective, fact- and science-based perspective on the situation. The private sector represents the opposite extreme, as we have to assume that their agenda is primarily greed motivated. With this in mind, we should not make partnering with the private sector a priority. We exist to enforce rules upon them to prevent impacts on human health and the environment, not to compromise, negotiate, or pander to whomever has the biggest wallet. State???s desires to be individual self-governing entities is, to a lesser extent, representative of	The major hurdle in providing efficient customer service is the arduous process that we have to go through to even provide a response. A technical staff person evaluates a situation, characterizes the important parameters, applies evaluation methods, reaches conclusions, and tailors a response. That response then has to go through a supervisor, which requires that the material is explained by the technical person. Then it has to go through their supervisor, and their supervisor, and technical explanations are required at every step along the way. Then the lawyers get ahold of it and butcher every point that you are trying to make. Because legal ramifications are possible, and highly likely in a greed motivated world, we have to say things to people without really saying anything at all. This of course is difficult (impossible) to do, so the technical person has to start over again and try to come up with some	We could hire more scientists and engineers and hire less lawyers. We could also preferentially promote people into management positions based on their technical expertise, which would eliminate the need to educate supervisors every time a new subject hits the table. Environmental policy, analysis, and decisions should be made by environmental scientists, not lawyers, politicians, and special interest groups.	The biggest example that comes to mind is data management. Each Region maintains individual databases, and when states have primacy, they maintain their own individual databases. There is no continuity between the databases, which means that the data contained within them are not universally compatible, and nationwide data cannot be accessed from one centralized resource. We actually have to put in many hours worth of effort every quarter to obtain datasets, change headings and formats to make them compatible, and upload them to a national database. All data from all regions and states should be managed in one database to begin with.	As long as everyone???s priorities are aligned (protection of human health and the environment), then collaboration is easily productive. We simply need to eliminate those with mis-founded priorities (like Fossil Fuels lobbyists that have been appointed to important agency positions).
481	480	5/3/2017	The state of environmental protection has made Great strides over the years (since the 70s and 80s in particular). The model to develop federal regulations that are delegated to the States is a good one. Unfortunately, once the States were authorized, the Agency should have done some downsizing. Instead, we developed new areas of emphasis and embarked on mission creep. Consider sunset clauses in new regulations for program reviews. Read the GAO's 2005 report 21st Century Challenges: Reexamining the Base of the Federal Government, especially Section 3: Where Do We Go From Here?	For the Air Program, let the Regional Offices run things. Stop letting Washington DC run it. They are too theoretical, not practical and way too political especially in the last 8 years. DC could be a monitor of what's going on in the Regions and a resolver of disputes between Regional approaches.	Many Regional staff are very experienced in their field since most staff stay at the Agency because we believe in the mission of protecting HH&E. As you may know, many State agencies have high staff turnover, poor pay which leads to few and inexperienced staff. Maybe Regional staff could provide more hands on technical assistance in coordination with States to achieve goals. It may mean more travel dollars to the Regions.	As mentioned in response to Q3, EPA staff are dedicated to the mission and have much experience to share with States in their times of reduced resources. Intergovernmental Personnel Agreements (IPAs) may be a mechanism. With regard to the land cleanup programs, Marianne Horinko coined the One Cleanup Program. Need to revisit. SF and RCRA cleanups should be done the same. We can streamline RCRA, why not SF.	The military services are continually inventing and using new cleanup technologies. Maybe look to better coordinate between DOD/DOE and EPA ORD research programs.	See response to Q1

481	See the Region 6 Corrective Action Strategy for expediting cleanup https://19january2017snapshot.epa.gov/tx/hazardous-waste-corrective-action-strategy-epas-south-central-region_.html Region 6 also has a Ready for Reuse program that has been a catalyst in site cleanup for reuse.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
482	481	5/3/2017	Limit the number of meetings we have. Our monthly OPP-OECA meetings are ridiculous. Things are still in pending, no hard deadlines are made, and apparently it is acceptable to say you are ???just working on things??Â. No way that would fly in a corporate world or any other office. People sitting in HQ or in other region say that things are still in process without a reasonable explanation, take leave on due dates, and lack of accountability. People should be given hard deadlines. Large call such a monthly call that have all 10 regions and HQ should be styled like a war room call with a concise agenda, no room for side distraction. Calls should be short (less than 45 minutes). 25% of an employee time should not be spent in meetings. Quality Assurance training is a waste of time. Having sat through the 3-day event, I would say that it is not in the interest of the employee. This is a waste of money and time a simple webinar could replace this. There are several EPA databases in EPA,	I have found that when partnering with someone for a common goal, things are more enthusiastically achieved when both parties have something to gain. Partnership should include public awareness; people should be awarded/recognized for their efforts to further their own or EPA missions.	Get on social media- snapchat, Instagram, Facebook, twitter, make YouTube videos. On social media you can show how to check your home for mold, lead paint, how to limit standing water in your yard that attracts mosquitos during peak Zika time. Showcasing the effects of pesticides on fruits and vegetables. Doing a video showcasing local farms and how they incorporate pesticides or don???t in their daily activities. Make PSA announcements to the public, like ???the label is the law??Â. Create webinar for respective party and inform them of changes happening within EPA (i.e. make a webinar for importers/brokers on the new ACE system). Have a presence in the scientific community like American Chemical Society, where we can present about cases. These can be at small gathering at local university to international/national conferences. This is important to do because it	We need to partner with local government/ local groups organizations (religious groups, community centers, large high schools) to further the aim of the EPA. Encourage sorting trash, composting, recycling	I would suggest that specific programs should be able to open to the public 24/7. For specific work, like imports that have a constant flow throughout the regions. Being in region 6, there are up to 100 imports in just pesticides coming in every day. In today???s world it is unrealistic to have imports sitting at ports Friday after 3 pm till Monday morning. We cannot stop because it???s the weekend. I recommend that staff should be given the offer to work weekends instead of days during the week. Also taking notes for ANY meeting is a waste of time, recording the meeting with conference calls or someone???s cell phone is way easier. This way we have higher accountability of what someone said.	Things become a priority The burden of costs, time, and resource do not all weigh on one specific party or agency. Every agency, or person for that matter brings something unique to the table. For example, the state of AR agricultural department has a good relationship with the FBI. While working on a project together you might be surprised by the contacts and resources agency have. Being able to work with different agencies is the most rewarding way to learn about your own program, others, and how you both can benefit each other.
483	482	5/3/2017	Too many managers at the SES level in a very small office is wasteful and wholly unnecessary. OITA, with approximately 65 to 70 total employees has 6 SES managers. Not too long ago (less than 10 years) there were only 2 SES level managers, with a few more total employees. These SES level managers travel all the time, and it is not unusual to see 2 & 3 of them traveling to the same meetings. It is embarrassing and an unnecessary waste of our resources.	The EPA can reduce global and transboundary environmental risks using our technical assistance, training, information exchange and technology demonstrations to match environmental problems outside our borders. Enlisting the expertise and resources of our private sector will greatly expand the range of environmental protection options that we can offer the world. This is what OITA had done very well under previous Presidents, but with the expansion of the SES core in such small office, the time & resources are spent as they travel to UN-TYPE meetings that don't get us any concrete results.	Focus OITA efforts on eliminating environmental forces that threaten directly the health, prosperity and jobs of American citizens, such as the pollution coming from Mexico, China and other underdeveloped countries. The environmental side agreement to the NAFTA & the CEC has become a way to funnel money into the pockets of corrupt Mexican politicians and to give Canada a free hand to overcharge us for important resources needed in this country. We need to focus on stopping pollution reaching the US by including environmental issues in the mainstream of American foreign policy where the decisions are made by our political leadership.	Ensure that all SES managers rotate positions every 4 or 5 years (which they are supposed to do anyway) so there is no opportunity to create fiefdoms that are so hard to identify from outside the offices. Our political leadership are rightly focused on making sure the President's agenda gets implemented, while these cadre of high level decision-makers make sure that there are as few changes as possible to the status quo.	US technology is the best in the world and the International office of this agency should be doing more to promote our environmental technologies to sell around the world.	EPA can provide important services to our States and Tribes by ensuring that serious environmental problems are confronted at the global scale. For example pollution of our oceans and losses of species and habitats have a widespread and long-term consequence and EPA can help protect our population by ensuring that our international agreements obligate them to take key basic environmental protection such as ensuring the availability of clean drinking water.

	I
482	Allow employee to work on a diverse range of projects. Employee that work hard, doing their work in a timely manner, and do good work should be rewarded with a raise, responsibility and other privileges such as working from home more than 2 days a week. People who don???t work hard, have poor relationships with their team mates, and don???t do good work should be penalized. I feel that everyone is awarded benefits (pay raises) for having loyalty to the government, this is a counterproductive approach. Just because you have been here for over a decade or 30 years doesn???t mean that your quality of work shouldn???t be called into question. Completely removed paper
483	Establish tracking systems to monitor emissions and tracking international pollution of our oceans and drinking water resources.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
484	483	5/3/2017	The difficulties in buying things and hiring people in the Agency are the main impediments I see to efficient and effective operations. OAM and OHR are largely regarded as being broken. It generally takes months to get any acquisition made or to get a position defined and filled. Until these processes work, little else is going to work well. The conflicting requirements for cloud-based information technology to use Trusted Internet Connection (TIC) and use of FISMA-compliant (FedRAMP-certified) cloud IT services create inefficiencies. GSA needs to resolve the inherent conflict of priorities this entails.			The overlap and duplication of "shadow IT" operations in OCFO, OIG, OPPT, OARM, and some other offices largely duplicate many functions of OEI. Consolidating those functions could reduce costs and inefficiencies substantially.	The Agency's new implementation of SalesForce offers a lot of efficiencies in business process automation, though it will take investment in more licenses to bear the most fruit and save the most money overall. Other uses of cloud-based information technology holds potential for added responsiveness and flexibility (though not as much for cost savings as the cloud vendors may claim).	
485	484	5/3/2017	When I travel I spend a lot of time figuring out the travel system - both before and after. It would be much more efficient to have support staff who are very familiar with the travel process do it for the Division or Office, rather than each person in the office, most of whom travel infrequently, try to figure it out each time.	We should be investing in collaborative work on a holistic, e.g., ecosystem level, with these partners. Addressing air issues separately from water issues and separately from land issues is inefficient and won't yield the optimal environmental and human health results. What goes into the air falls on the land and water. What goes onto the land gets blown into the air and leached in groundwater and run-off into surface water. Etc. Yes our statutes reinforce the silos, but we should be able to build systems to bridge the authorities - federal, state, tribal, local, etc.	Allow for more participation in meetings with states, tribes, local governments, public interest groups, the regulated community and the general public.	Not really. Although I do hear that the efforts to undo current regulatory requirements will lead to increased costs and inefficiencies. For example, the production manager at a large local drinking water utility says NOT to withdraw/suspend regulations. They have systems in place that are responsive to current regulations and that work well to protect the public. EPA cutting back on those regulations will lead to confusion and possible disaster (his words). EPA should make much more aggressive use of cutting-edge monitor and sensor technologies to reduce costs and inefficiencies -- and perhaps improving environmental	Monitor and sensor technology is amazing and could be applied and many scenarios to make EPA more efficient and effective. This technology is especially useful for data collection and for emergency response.	I think in many cases we are already well aligned. Plenty of exceptions, of course.

AMERICAN OVERSIGHT

	I
484	Agile development principles (e.g., http://agilemanifesto.org/) -- iterative development starting with a small initial increment to get real feedback and accommodate change over time from real users interacting with a working prototype -- can be applied helpfully to many disciplines besides software development.
485	EPA should invest in drone technology for monitors and sensors. Other federal agencies are well ahead of EPA on this technology. It will greatly improve our efficiency and reduce our costs. Rapid approvals of monitor and sensor technologies for data collection and reporting will benefit the private and public sectors.

AMERICAN OVERSIGHT

486	485	5/3/2017	The review and clearance process for the publication of scientific research results is overly burdensome. Management seems to have spent a lot of time coming up with new requirements to make sure the agency is not embarrassed by any published work. Hiring qualified and talented research staff should be sufficient. Scientists themselves are responsible for the products they publish. If those products are sub-par, it will show by their submissions being rejected by reputable journals. The fact that ORD has added multiple layers of approval for clearance to publish could appear to the public to be intended to censor our scientific findings. However, I don't personally think that is the case.	All parts of our society have a stake in making sure our environment is protected and should be involved in deciding the proper actions to take. However, disagreements are always an issue and very rarely will everyone be satisfied. This situation cannot be allowed to prevent reasonable actions to be taken, but politicians and government officials seems to be unable to take on this challenge. One dissenting option seems to often able to prevent any action.	Let EPA do what it is supposed to do, and only what it is supposed to do. Middle- and upper-level management seems to be preoccupied with growing the organizations they control rather than producing quality products that address existing requirements. Bigger and better are two different things!	As a scientist, my research is greatly hampered by lack of computational power within EPA and the lack of funding to provide secure communication to larger computing systems outside of EPA. I am forced to employ simplified methods that degrade the quality and applicability of my results. I perceive this to be a result of poor management structures and lack of communication within them. This has been an unresolved issue for two decades now.	Yes, but they would require an up-front investment that EPA does not seem able to afford. Management seems to be rewarded more for cutting costs and less for increasing efficiency and productivity. EPA either needs more computing resources within, or it needs to facilitate the use of external resources.	Let the National Institute for Environmental Health Studies (NIEHS) deal with issues like human health and indoor air quality and let EPA focus on air, water and ecosystem pollution. We have to understand those environmental processes first before we can decide what needs to be done to protect them.
487	486	5/3/2017		We need to support economic development in states that need help transitioning from industries that are never coming back, such as coal mining, to the jobs of the 21st century. Beyond that, we have already been doing a very good job of partnering with states. There are more states in this country than Oklahoma, and we have had very good working partnerships with many, if not most of them. I have been part of these partnerships and have spent time at a state agency. You should talk to staff directly about our programs and learn these things. You can even read about some of these partnerships on our website!!	The public is not our customer. We work for them. They are our employer. They employ us to ensure clean air and clean water, which is necessary to sustain life, prevent disease, and allow people to be productive. Rolling back regulations that ensure clean air and clean water will not help people be more productive. Nor will it help the economy overall; when business profits by making people sick, the overall economy does not benefit. If you think it does, you are conflating the short term profits of a few with the long-term economic health of the many.	I see many opportunities not to cut the legs out from under programs that provide much needed guidance to states, that most states actually want and need. You should talk with the other 49 states, beyond just the one you come from.	Yes, in the real world. For example, last year the solar energy industry in the US hired more people than coal mining employs (look it up). China is leading the world in investment in the technology of the 21st century (renewable energy and energy efficiency, the fastest growing industries worldwide). Do we want to lead in the technology of the 21st century, or cede that ground to China in our zeal to chase the technologies of the past?	You mean through budget cuts? Not going to help you there.
488	487	5/3/2017	Eliminate all need for Lotus software. It's email function was eliminated years ago, but is still used for grant management tasks. Help Desks are helpless with Lotus support, and it is far past time for Lotus to go.		Develop and keep up-to-date a roster or directory for Regional points-of-contact on various issues. Then inquiries can be directed to the appropriate person to give the best response.		Revisit and streamline grant review process if possible. Also provide more openness for reviewers that participate in terms of the selection process. The selection process is a bit of a "black box" for everyone except the Coordinators.

489	488	5/3/2017	1. Purchasing: For all micropurchases (<$3,500) for which a government purchase card is used, there are 3 separate electronic systems required with 3 different user names and 3 different passwords. The first is the approval system that routes procurement requests to various approvers and the FCO for funding. The second system is the allocation system in order to pay the vendor post-charge. The third system was implemented strictly for electronic documentation following an audit that identified localized abuse. Those staff committing abuse should have been punished and/or fired. Instead, all purchase card holders got slapped with more administrative burden (this is an ongoing theme also happening in other administrative arenas). Some foresight and up-front investment should have resulted in a single cohesive electronic system that can handle approvals, funding, allocation and documentation. The current system(s) impart unnecessary administrative burden on	In some areas of research, partnerships such as these make sense for achieving better environmental results based on specific issues that affect localities. However, modernized chemical safety research inherently serves everyone due to chemical screening approaches that evaluate potential modes of toxicity across broad swaths of chemical classes including pesticides, food additives, cosmetic additives, pharmaceuticals, etc. Exposure to man-made chemicals knows no boundaries. An impartial national research program, free of special interest, to evaluate chemical safety is imperative. On the one hand, many would argue that tight partnerships with the private sector regarding chemical safety research would be a conflict of interest and have great potential for corruption. In the case of federal chemical safety research,	Lift administrative burdens and red tape in order to allow more efficient execution, completion and communication of science. Increase level of trust in federal staff and alleviate these extra administrative burdens that have been added on to everyone???s workload due to a few incidents of abuse that should have been dealt with locally on a case-by-case basis.	This has been addressed in multiple other questions.	Standardize business practices. 1) All government purchasing, macro and micro, should be facilitated by a single cohesive software-based system (see also Q 1). 2) Record-keeping policies should migrate away from paper to electronic and have a sensible software-based system that can handle/archive research records, administrative records, etc. all in the same system and be consistent across the agency.	We???ve already done this to a large degree in the latest round of research planning. For chemical safety research, there are only select opportunities to partner with other federal agencies and/or states. As stated earlier, partnerships with states or other private or local entities for chemical safety research has potential to impose special interest on the process, which can undermine impartial federal research that is inherently serving the whole US and other nations throughout the globe.
490	489	5/3/2017	For many many many years now, EPA has been eliminating administrative support employees/positions. While EPA has become much more efficient with electronic ways of doing things (voice mail, email, payroll etc) there is STILL the need for administrative support personnel. Otherwise, highly grade employees, GS 14s, are spending too much time doing their own administrative work. That's not an efficient way to use a highly graded, highly educated employee's time.	Better environmental results can be achieved by working WITH EPA employees, not against us. And by cutting out the rhetoric. We are the experts and should be treated as such. Communicating things like 'the war on coal is over' and pitting the 'environment against jobs' is not helpful and not even true. Environmental protection CREATES jobs. Green energy CREATES jobs. EPA has never had a war on coal. Coal is a throw-back to the 1940s and 1950s. Its not a cost-effective source of energy compared to, for example, natural gas, and to tell coal workers their jobs are coming back is untrue. Not to mention that putting a few dozen coal miners back under ground is hazardous to their health. It would make more sense to invest in environmental (and health) protection and green power and retrain coal miners to work in green technologies where there is	By cutting out the rhetoric. EPA is not the enemy. We have always worked with states, tribes etc. There is always room for doing a better job, and as professionals we strive to do this.	There is too much focus on cutting costs without seriously considering the human health and environmental consequences. Cutting back or eliminating important programs like WaterSense and the vast array of other voluntary and partnership programs EPA has developed over the years may reduce costs but they won't protect health and the environment. They will endanger public health and lead to a less sustainable environment - of which we all depend. Lets put the focus on being more effective in protecting the public and the environment.		The federal government's role can't be passed on to the states. Many environmental issues cut across state boundaries. And resources vary from state to state. That's why the federal role in human health and environmental protection is so important. Of course, federal-state partnerships can always be strengthened, and they should be. Its destructive and counter-productive to have a negative attitude about the federal government's role. I do think there should be some focus on where federal agencies overlap and how federal agencies can better

491	490	5/3/2017	Management Procedures: Too many layers for review before signature approval. Unnecessary, multiple reviews slows down approval time, halts work to wait for review and hinders efficient processing. One less review would save time and improve efficiency. Eliminate at least one layer of management before subordinate employees are RIFed. Management does no work, only shuffles papers to sign. Regional Administrator, Assistant Regional Administrator, Deputy Regional Administrator, Deputy Assistant Regional Administrator, are they all really needed? How much income do they generate for the agency? Could any of their ???work??Â be contracted out or placed under a term/temporary status?	Encourage states, tribes, local communities and the private sector to use more of their funds to achieve better environmental results. Develop new ways to produce better environmental results that decrease the federal government's funding contribution and increases the private sector's contribution.	Hire contractors to act as government liaisons to the states, tribes, local communities, the regulated community and the public at large. Contracting this work out would save money and improve efficiency. Look at site inspector positions, Information Technology (IT), records management and building security. All are using contract personnel and working just fine. Contract employees are easier to manage and provide flexibility.	Telework is an untapped opportunity and an underused perk. There are employees in offices with little work and work in offices with few employees. Establish more shared service centers like the IASSC and allow employees to work on personnel, finance, grant preparation, etc., that they now complete online anyway. College courses are taught online, why can???t work be performed online outside of an office? To attract the best and brightest you need incentives and perks???don???t get rid of them! Two employees who telework 4-5 days a week could share office space because neither would be in the office at the same time. Save on rent, utilities and	Immediately change regulations to allow electronic signatures, use of electronic forms and make all forms electronic and fillable online. Start moving files to electronic versions. We already use the computer to process, send, receive, approve and close projects. Prepare regulations that require electronic files be used and save a boatload of money on paper and warehouse storage. Electronic files allow agency flexibility when assigning work so employees won???t have to be where the file is located to work on it. The agency will need to scan mass amounts of files when they move to an electronic form. Hire a contractor to do the scanning and leave the employees to review the	Our agency utilizes 2 shared service centers to process interagency agreements. This concept can be used for other actions/work done in all 10 regions. It will allow the agency to provide more uniformity with their actions, utilize employees where they are located and reduce the workload impact of departing workers. We utilize another agency to process our payroll and I believe we use other agencies' contracting services.
492	491	5/3/2017	The hiring of SES or upper management that is not qualified for senior level scientific positions contributes greatly to the inefficiencies at the agency. Senior management hired in from Social Security, GSA, or other non-scientific agencies , following the ill logic of I don't need to know what you do to mange you is false with respect to scientific organizations. When senior management is quoted as saying they do not want science or like scientist's, why are they hired? I would solve this by having an outside agency, such as DOI, have the final hiring say in hiring technical senior management positions at EPA. They would pick qualified candidates, not personal friends.	Better outcomes require more dialogue at the start of the process and then holding people and schedules near the end. The agency has a severe lack of planning and a little preparation up front, coupled with consequences at the end, would go a long way to improve results.	See above.	Several untapped opportunities come to mind. 1) the organization of all of the regions should follow a single model. Some at centralized, some are matrix, some are hopeless. 2) Hire technical staff for technical positions including management. 3) Look at grant and purchasing rules. Every time one person tries to manipulate the system, all the other staff are punished. Why add or change rules constantly? Punish the rule breaker and go on. If you review, streamline, and eliminate redundant positions, punish those who abuse the system, and you will reduce costs.	Review and then centralize the purchasing, property, potential QA, and other functions tracking processes. The agency has so many home grown systems, (based on stove pipe thinking) that a review would identify numerous cases of duplication. Then agree on one and enforce the use of it.	We do well in Region 8 with this. I see us as an example for the rest of the agency.

493	492	5/3/2017	It seems like we are always patching things together to accomplish administrative functions and one of the reasons for this is that we utilize different programs/applications for one specific process. For instance, Procurement is done in EAS, Timekeeping is in People Plus, Budgeting and Spending is in Compass Financials with duplication of another finance system called IRMS for tracking research support dollars is done in another system (IRMS is ORD specific). One solution I have always believed in is for the organization to utilize an integrated enterprise application that allows for all functions to be tracked in one application. The system contains cross functions, and it automatically communicates and provides multiple functions from one point of entry. These systems can be tailored to the needs of different offices (Regional Offices have a more standard application, ORD or other offices that have a more complex need can utilize a more tailored version).	No comment.	No comment.	No comment	Enterprise Resource Planning (ERP) and data management programs - one stop applications to fulfill multiple functions (accounting, procurement, human resources, timekeeping/payroll, ...). We have some of these systems on the ground, but we only utilize them for one function only. This seems costly not only on a financial standpoint, but also on a time standpoint for employees (labor costs are higher because of this).	No comment.
494	493	5/3/2017	Acquisition process in the EPA is extremely cumbersome and archaic. Requirements to purchases a product or service on behalf of the government are not either not clear or constantly shift. OAM should make the purchasing rules simpler and expedite purchasing of small business products and services as well as micro purchases so the government can pay the small business faster and acquire the needed product and service faster as well.	More stakeholder/public engagement in form of a digital dialogue would be a good way to enhance the services government provides. This could be accomplished through a social networking model such as Facebook/Twitter, or through the old fashioned way of gov delivery time notifications which solicit feedback via email or a docket like system.	I am not why we don't solicit feedback from our customers in forms of 'Customer Satisfactions Surveys' as the private sector does. That is the only way I can think of that you'll know for sure what to improve. We should always follow up with our customers or a representative sample of our customers if the customer base is too large to determine what the experience was like and how we could do a better job.		I am an information technology professional. My suggestion would be to require all applications being developed to be only deployed on the Cloud. The agency recently acquired Microsoft Azure Cloud services. We should add to that selection other Cloud providers such as Amazon Web Services. Deploying all applications to the Cloud would move us away from purchasing and keeping large amount of local infrastructure costing millions in contractor support and licensing costs. I understand that there will always be a need to keep some databases under government control so a much smaller footprint of infrastructure would be needed to safeguard the most sensitive PII or CBI on	More MOUs with other Federal Agencies in information sharing would increase awareness of each other's work. We should also launch a government version of Facebook where Federal employees could share ideas about innovations and efficiencies internally.

AMERICAN OVERSIGHT

	I
493	An example from the WEB of a state government solicitation for Enterprise Technology can be found here: http://www.doa.state.wi.us/divisions/enterprise-technology/erprfo There are many others - mostly county and state offices that are turning to this technology to provide efficiency.
494

	A	B	C	D	E	F	G	H
495	494	5/3/2017	The Criminal Investigation Division has historically not had much administrative support. As a result, higher paid employees are often forced to do work that could and should be done by lower paid employees. A simple remedy is hiring more administrative support in the Criminal Investigative Division to free up agents to do agent work instead of admin work. Along the same lines, large law enforcement agencies have investigative assistants to handle some of the tasks involved in investigative work, such as records searches and criminal history checks. Hiring lower grade investigative assistants would also free up agents to do 'agent work.' While these suggestions might not save money, they would make CID more productive without hiring additional agents.	Unfortunately, in Florida, the state agency has been gutted to the point that they are not effective. We really don't partner with them much, because it does not seem that their mission is actually protecting the environment. I'm not sure this can be fixed by the federal government, other than taking the programs back from the FDEP. That would not work either, as EPA does not the resources to run the programs that have been delegated to the state. Fortunately, some (but not the majority) counties have effective environmental protection programs.		As previously stated, hiring additional administrative employees to remove administrative duties from case working agents and hiring investigative assistants to help with some of the tasks of an investigation that don't require a sworn law enforcement officer.		
496	495	5/3/2017	Travel administrative burdens like Travel Comp Time forms, inefficient and buggy computer systems (Concur), lack of access to travel card account information are an overwhelming burden to staff, and are exacerbated to staff who travel more often than others.	Building Grant management capacity within these partners.	More Public Participation Practicioners would help facilitate necessary neutral communication between partners and the Agency.	Eliminating evacuation authorities during an environmental emergency response to anyone outside of EPA.	Development of national resources to address the Region's needs for translation/interpretation, graphics support, and mailing list collection, management and database needs.	By increasing enforcement and penalties on States who violate clear Federal environmental statutes.
497	496	5/3/2017	Since January, all communications materials have had to go through OP for approval. This is creating an incredible backlog of work and shows lack of trust in staff and senior level management to review materials within AAships. Any project that has a communications piece tied to it has to add an additional MONTH to its timeline in order to accommodate this longer review chain. Add to that the fact that OP is like a black box at this point, where no information is forthcoming. Even routine emails to stakeholders in EPA programs get caught in this web.				New technologies are not necessary at this point--rather better trainings for existing tools are needed. To roll out systems like SharePoint, older staff should be required to go through basic training in order to ensure office-wide capabilities.	

AMERICAN OVERSIGHT

	I
495	
496	Our region has interdivisional events / brownbags to help EPA staff learn about environmental programs across the Region that are lead by those who work on them. It is an amazing way to increase interdivisional collaboration to improve environmental results.
497	Morale within the Agency is abysmal, largely due to the fact that information is leaked to the press before it is sent to staff. Internal communications need to improve drastically by sending updates more frequently and providing actual information. Acting AAs and DDs are having to pick up the slack by sending out the little information they have or can share. Increasing morale would lead to a significant uptick in office efficiency.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
498	497	5/3/2017	Too many different inspection and enforcement tracking databases. ICIS is the main inspection and enforcement tracking database. However, each program has its on inspection and enforcement database. States also these individual program databases. The ICIS database is archaic and the facility data has not been cleaned up in years. For example, there will be several different listing and addresses for the same facility. Only one correct facility name and address should be listed into the system. Ideally, EPA would develop a comprehensive database the captures required data of interest to management, elected representatives, and the public.	Joint inspections with state, tribe or local community where the state, tribe or local agency is the lead for the inspection (assuming the program has been delegated to agency) and EPA provides technical expertise. The local agency would be the lead on the enforcement whether formal or informal. This way local agency and the company or government agency (U. S. Army National Guard) will benefit from EPA's experience and understanding of the application of the regulations. It should be clear that if the state, tribe or local agency does not have the expertise or the resources to follow-up on the any identified violations, the state, tribe or local agency can ask EPA to do the follow-up, if any.	Better communication equals better service. EPA and EPA Regions should contact states, tribes, local communities, etc. to develop individual, informal communication plans. These plans should be followed through and not just placed on shelf in order to check a box.	EPA should be receiving more money not less. There are inefficiencies. One way to identify and accomplish this is to have a truly outside, objective consultant that understands how the government works perform a study of EPA as a whole and each EPA region separately. The consultant would review processes, procedures compare that with what Congress has mandated and identify probably 1,000s of improvements. Some improvements would undoubtedly Congressional approve before being implemented. To do this right would take time and money, but in the long run would be good for the agency and the environment. If you are looking for quick, overnight	See Item 1. State of the art, up to date databases that user friendly.	Each state and EPA Region should meet and determine areas the State needs support and where EPA can provide that support, other than money. States are always happy to receive money.
499	498	5/3/2017	1) Purchase Card purchasing has too many (unintegrated) databases which require mandatory input from each purchase card user. These software systems (PNET, ORD Purchase Card System, EPA Cost Allocation page) all need to be integrated into a "one stop" shop for PC data input. 2) Project Action Lead Time for Contract procurement is too long. More Contracting Officers need to be hired to process the various contractual needs for ORD. 3) The Office of Research and Development needs to be reorganized to remove the redundant secondary tier labs (i.e. NHEERL, NERL, etc.) The positions within this level of management are all redundant to those positions that already exist at the local laboratory level. They are redundant to the necessary and crucial positions which already exist at the local laboratory level. Often times the NHEERL/NERL level of management gets	Local laboratories need to have the autonomy to engage with their local neighborhoods and communities in providing sound data and cleanup solutions rather than having to vet everything first through the program offices. Citizen Science initiatives are a great starting place.			IT contract should all be centralized and dispersed from headquarters. There are too many private sector IT contracts that are not integrated and do not share their information with one another. ORD has a separate contract for IT services than Region 5, etc. Often times there will be 5 help tickets from 5 different IT contractors to support one employee help request to correct a simple IT problem. There has been too much privatization of our IT support and no integration of the various contracts. In addition, the contracts are changing every 5 years and each new vendor has a hard time integrating with others or its predecessor.	IT support should be one centralized agency. Contracts support should be one centralized agency. The duplicity of these two areas throughout the executive branch is redundant, not cost effective, and extremely inefficient. Take example from the DoD and create one "DCMA" for the Executive Branch. Take example from the DoD and create one centralized Executive Branch IT "Department" for deployment of unified systems and softwares that are integrated and have a "one stop" shop for customer service

AMERICAN OVERSIGHT

	I
498	See answer to Q.4. Too many decisions for reorganization, improvements are made from the top down. To achieve real improvements, best practices, the ideas need to come from the bottom up. Again a 10-minute survey cannot accomplish this. It is just seems like you are trying to check a box that you reached out for idea and probably only receiving a few, if any, real suggestions that would improve how EPA operates.
499	The DoD "DCMA" Defense Contract Management Agency should be studied for Contract Award and processes Best Practices. Like the DoD, the EPA should study its systems for integrating its workforce with its facilities footprint and real property. There should be justifications for the amount of office space and laboratory space vs. actual FTE/Contract staff and the workforce mission should equal the Facility real property mission. These two are currently disconnected.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
500	499	5/3/2017	HQ Contracts is a broken organization. Contracting specialists and contracting officers DO NOT respond to e-mails from their customers. The ORD OARS organization is filled with incompetence and disorganization.	Getting rid of Scott Pruitt	Getting rid of Scott Pruitt	Yes, getting rid of Scott Pruitt will improve employee morale (hint: look back at the Gorsuch days in the Agency).		Getting rid of Scott Pruitt
501	500	5/3/2017	In OGC, senior GS-15 attorneys end up spending huge amounts of time doing data entry regarding their cases into databases, photocopying, and other things that could easily be handled by a GS-12 paralegal. The current system is a waste of money and valuable attorney time, and the Employee Viewpoint Survey indicates that having to deal with such issues in OGC significantly lowers morale. Hiring paralegals to do appropriate work in OGC would be a big help.		Increasing our staff size so we have time to adequately respond to their needs.			
502	501	5/3/2017	Many regional decisions on sub-regional implementation of regulations have required briefing at every level up the chain all the way to the HQ offices and OGC, which can significantly delay often routine decisions, particularly in the current state, where very few of the political leadership at HQ is in place (the sooner this could happen, the better). Placing more trust in the knowledge and experience of regional career leadership and staff would help improve this process, as the Regions have valuable experience and insight into sensitivities of relationships with local stakeholders, Tribes, and States. Possibly more willingness to produce guidance to the regions on relatively routine decisions would help assure the Administrator and AA's that regional decisions are consistent across EPA.	Encourage EPA-convened stakeholder working groups compliant with FACA, and EPA participation in working groups convened by Tribes, States, regulated industry, local communities and environmental advocacy groups. Continued/more funding for public stakeholder outreach and transparent information sharing.	Allow regional leadership more latitude to make decisions on routine implementation of regulations at the regional and sub-regional level. Place greater reliance on experience and knowledge of career staff. Continue and enhance regional involvement in national rulemaking to ensure input from the staff that implements the regulations. More funding for agency licenses and staff training of softwares used by regulated community to demonstrate compliance with regulations.		Seek to consolidate appropriately various national databases used for tracking implementation activities and reporting to Congress. Several track the same or similar information and it becomes increasingly cumbersome for career staff and management to keep track of which databases need to be updated. Funding to develop an implement electronic submittal and reporting systems for regulated entities to demonstrate compliance with regulations such that the information can also be made publicly available.	Cross agency stakeholder working groups are already being implemented for several areas of oil and natural gas development that appear to be beneficial in information sharing and relationship building. Allow more memorandums of agreement between agencies for establishment of lead agencies for federal government compliance with common requirements/obligations, provided there is adequate public input.

AMERICAN OVERSIGHT

	I
500	Ignoring the existence of Scott Pruitt and continuing to accomplish the goals of the Agency.
501	Hiring paralegals to do data entry, proofreading, filing, and other tasks in OGC, instead of GS-15 attorneys.

503	502	5/3/2017						
504	503	5/3/2017	I've worked for EPA for 25 years and the Federal government for 33 years. The mandatory administrative and training requirements have become crippling. We no longer serve the public. We serve ourselves and the tax payer takes a back seat. A good example are the contracting requirements. Penny wise, pound foolish! On the administrative side, we increasingly have high paid staff doing administrative work. Work that can be more efficiently done by a lower paid administrative professional.	Many areas of our work is duplicative of efforts undertaken by other governmental entities. Specifically in the area of grants. Funds could be more efficiently distributed by the State and local governments. Grants to tribes are currently distributed to the tribes by a large cadre of EPA grants officers. The Government could relies great efficiencies by contracting the issuance of these grants out to the private sector.	Remove crippling administrative requirements . This would allow staff capacity to focus on the "people's business" and not on self imposed internal requirements.	Yes, again by stripping away onerous internally focused administrative requirements. Also, empowering staff to have flexibility, with in the law, to immediately address the public's concerns.	No comment	Generally speaking, empowering and funding sister state agencies to the maximum extent possible with minimal EPA oversight would reduce duplication and increase efficiencies ! Ultimately reducing EPA expenditures.

504	Contracting out the issuance of grant funds. Reduce administrative requirements. Reduce "red tape" and needless bureaucratic processes ! Focus exclusively on "core" programs with direct statutory empowerment from Congress. Disinvest in all programs that have no statutory authorization . Refocus staff in serving the public.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
505	504	5/3/2017	In the last several years, EPA has made great strides to update our information systems (mostly related to the Office 365 switch that happened in 2013). These updates are great and significantly improved our ability to do work in the 21st century. However, for example, we still have a situation where technical staff (engineers, scientists, etc.) are obligated to do administrative work, such as moving records received by email to a database system, or records received in hardcopy that must be scanned and then entered as well. This means you are paying someone $40-50/hr to do this. This could be solved with updated - agency-wide - databases, where information is submitted directly to an electronic database system. This would eliminate the administrative requirement on our side. AND, would ensure we are actually tracked all of the records/submittals we receive. There is no such process for that in my region. Historically, it has been on individual regional offices to find solutions to document receipt and retrieval. A	This is almost always completely related to funding. Give EPA money for us to give to states/tribes/locals that requires deliverable environmental/health improvements.	Due to budget cuts we don't have sufficient travel funds to visit these groups. Especially in cases where we have oversight of state/local/tribal programs, it is difficult to develop the needed relationships to provide assistance if we never have an opportunity to regularly meet our counterparts. States/locals/tribes seems to always want more support/interaction with us. It really helps us to learn a local perspective since we are often far removed from their issues. This is specifically in reference to staff and interactions and not manager/director interactions. Staff are the ones doing the real work and need to understand the "on the ground" issues.	All electronic documents storage/retrieval. I previously worked for a state agency and they made the switch to all electronic records, in one system, over a decade ago.	Electronic systems. Office 365 was a very good addition. But, it seems like we purchased the cheapest version that doesn't have all of the available options.	I think we do a pretty good job and this, and are always finding ways to improve.
506	505	5/3/2017	For scientific research, a more efficient purchasing system is required to ensure that senior research investigators and their staff are able to fulfill research aims mandated by law and considered in our strategic plan. States, tribes, and local air pollution agencies require the expertise of ORD to help address their specific air pollution issues. I believe the credit card limit for purchases should be increased to $5,000.	I believe we need the staff which has expertise in sophisticated pollution measuring research instrumentation to conduct localized studies to identify pervasive and intractable pollution issues that prevent attainment of air pollution standards. Neither the instrumentation nor the personnel exist within the states, tribes and local communities for pollutant measurements needed to understand their specific issues.	I believe e-mail is over-utilized and distorts communication. At present, the phone (cell or landline) is far too underutilized. Customer service is best achieved by talking with another human being without annoying voice-mail systems. In addition, we need a better publically available database of EPA personnel, phone numbers, and areas of expertise available to citizens, states, tribes, local communities, and the regulated community.	Quite honestly, I believe we are tapped out. Even within our laboratory - NERL - we have lost one-third of our technical staff in the last 10-15 years and our administrative staff is mostly operated with temporary personnel. Sorry to say it but research is expensive. However, there is no other alternative of trying to understand air quality issues without high-quality data and interpretative skills to match. In the great scheme of things, it's relatively easy to collect data; understanding what they mean is far harder.	An e-mail system that is far more functional. Our Internet browser is completely outdated and slow. An investment in more up-to-date technology would make the workforce, especially researchers far more efficient, effective, and accountable.	I believe that EPA ORD should better partner with the other atmospheric chemists in NOAA, NASA, DOE, and the National Labs.

AMERICAN OVERSIGHT

	I
505	Kentucky DEP has a department-wide electronic recordkeeping system that also does workflow. This means all records are stored in the database, but when permits/reports/etc. are submitted it creates a workflow assignment that ensures someone is actually assigned and accountable to the action. Furthermore, you can easily find out who is assign to something, saving a lot of time finding contacts. It's also helpful that you can access everything you would ever need from your computer. EPA has a very annoying patchwork system. I'm sure some offices/regions are good at tracking some things - but there is no uniformity to it.
506	Contracting with private science and technology companies to provide technical expertise that is needed far more quickly than can be achieved through Federal hiring procedures.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
507	506	5/3/2017	Mandated agency-wide training on topics that are not relevant to everyone. For example, training on working effectively with tribal governments is not relevant to my job. I do not and will never do anything that touches tribal affairs. Another example would be continuity of operations awareness training, which teaches that coop plans exist and generally what they contain - but my organization does not have and probably never will have a coop plan. I would address this by allowing first line supervisors to determine what training their employees need. Also, oppressive requirements for documenting and obtaining approval for micro-purchases with government purchase cards (credit cards). It is almost easier to process a formal purchase order than to use a credit card to buy a box of paper clips. This is symptomatic of a long-standing management philosophy in EPA of punishing the entire agency when one or a few individuals abuse privileges,			Mandatory rotation of all SES personnel every three years to a different AAship to eliminate "empire building."	Replace MS Windows and MS Office on desktop computers with Linux and open source software alternatives. This move would both improve IT security and radically reduce the costs for IT security, as well as eliminating software license costs for standard desktop productivity software.	
508	507	5/3/2017	Timekeeping: People + and the other systems for tracking time/hours are poorly designed, difficult to navigate and take time away from substantive work just to fill out and maintain. Disruptive to accomplishing mission goals. Upgrade to systems that talk to each other and do just as good or better job on accountability of hours.	Make it easier for EPA to LISTEN to all stakeholders. The formality of current communications discourages the flow of ideas from states to EPA and back again; keep an open window for communication without obstacles of triggering FACA every time EPA wants to gather input in broad terms. We get better environmental results when we LISTEN, so make it easier for us to actually LISTEN.	Why are so many technological solutions that move us away from tracking volumes of paper prevented by regulation and costs? Why isn't EPA 99.9% paperless? Moving to the cloud should not be expensive and burdensome. Customers have better service when they don't have to deal with paper burdens. Regulatory changes may be necessary but are not huge obstacles - the main one is getting easy, reliable access to the cloud.	Yes. See #3 above. Evolve toward a paperless EPA.	Ibid.	How willing are you to use public disclosure of compliance reporting?

AMERICAN OVERSIGHT

	I
507	I am aware of very large amounts of money being wasted on service contracts because the senior management that approves the requests are technically incompetent, i.e., they don't understand the request and are afraid to admit that, or are easily hoodwinked. As an example, I work in an office where the staff are scientists doing very technical work, and for a number of years our office director was a history major. Wasted funds could be reduced by assigning technically competent people to senior positions who can and will challenge requests for service contracts.
508	Some agencies are able to access cloud hosting quickly and cheaply such as Dept of Interior. EPA does not. See # 3 above.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
509	508	5/3/2017		Enable Federal Register notices to resume being published in a timely manner, both by streamlining internal review processes and by adding FRN processing staff. Since January 2017 a backlog of unpublished FRNs has accumulated of my office's work. If our documents can't publish, we can't receive or respond to public comments from states, tribes, local communities, or the private sector.	Increase or at least maintain funding for the Agency.	Improve employee development and cross-office knowledge by providing more encouragement for details within the Agency.	Please allocate funding to repair or replace the built-in and portable projectors in the Potomac Yards building. On my floor we have one portable projector to cover for 4 conference rooms, and the built in projector in our main conference room is broken. Not being able to project meeting materials if someone else is using it slows team communication and can comprise the quality of meetings with visiting industry representatives.	
510	509	5/3/2017	Our time-keeping system is arcane. I would, if possible, try to reduce our time-keeping system to one.	We should be aware of unfunded mandates. Where they exist, we should make sure Congress is informed.	Focus on and modernize the EPA's internet tools. For example, the current Chief of Staff (Ryan Jackson) is not listed on EPAs website (as of 5/3/17). Out of date internet information - like missing contacts and broken weblinks - make it harder for outside stakeholders to figure out how to engage the EPA.	An ounce of prevention is worth a pound of cure. Strengthening EPA's pollution prevention actions (like Financial Assurance Disclosure for Mining), helps to reduce future costs and inefficiencies for the taxpayer. Once a site is full of toxic waste and it falls to taxpayers to pay for the cleanup, it is very inefficient to clean that site up to the point where future businesses can operate there.	Investment in EPA website is key. EPA depends closely on information, and information flows mainly on the internet. Fixing the gap between EPA's dependence on information and the quality of EPA's website would make EPA more efficient, effective and accountable.	Because public health and environmental protection is complex, there are overlaps or partial overlaps among federal and state agencies. The different agencies may not be aware of the overlap. One way to help with this situation is to do our work with specific geography in mind. Regional offices help with this. So also do geographic programs, which are designed to cut through various programs to solve specific sets of problems in a specific place.

AMERICAN OVERSIGHT

511	510	5/3/2017	EPA Region 6 recently conducted training for what it calls Applicability Determination, Alternative Monitoring, and Compliance Assistance Projects (ADAM-CAP) - this unapproved training is a complete waste of time and effort. It basically trains EPA staff to interpret confusing and misguided rules and then posts its response for others in the regulated community to view. These EPA regulations are part of an overburden regulatory system that has hindered economic growth, while at the same time angering and threatening the regulated community. See the following link for more information: https://ofmstage.rtpnc.epa.gov/apex/tocar/f?p=149:700:14121138680666	Have EPA staff co-located with its State partners to better coordinate and save taxpayer dollars.	Have EPA staff co-located with its State partners to better coordinate and save taxpayer dollars.	Consolidate Regions into West, Central and East Regional offices with smaller satellite offices. Save taxpayer dollars by having all labs partner with local universities to share costs, resources, and staff.	Streamline management positions at all levels from SES to GS-14. Currently, at a number of Regional and HQ offices there are too many managers and not enough staff.	Consolidate functions and avoid duplication of offices at Regional and HQ offices.
512	511	5/3/2017	People plus is very inefficient! If I submit a leave slip, and then need to change it, my supervisor has to go into people plus and return it to me. I should be able to pull it back myself. Also, people plus doesn't deal very well with submitting multiple leave requests for the same day (different types of leave), wasting staff time and timekeeper time. Concur is also a very fussy, finicky system that gives errors all the time for things that are not errors (i.e. tells me I didn't pick a city pair when I did, but gives me the error anyway).	Continue the EJ grants, children's health grants, asthma grants, indoor air grants, and environmental education grants. These grants are so important for the work being done in communities. Administrator Pruitt should meet directly with communities. Based on his facebook posts, he always meeting with various industry groups or states. He needs also to meet directly with communities and tribes and hear about what's most important to them.			We need new computers! Our computer are old, outdated, and always having problems. It was a bad idea for EPA to purchase tablets. They don't work very well, and they can't do all the things that we need to do.	

AMERICAN OVERSIGHT

	I
511	LEAN methods to reduce lengthy and overburden processes, however, the real issue to too many high paying managers. EPA is a top heavy organization and many manger positions need to be converted to staff positions at a lower grade to save taxpayer dollars.

513	512	5/3/2017	FMFIA - Most of it already has drafted responses provided. Why do those responses have to involve everyone? Do it centrally, send the draft and ask each location to verify (and add a local spin if needed). So much wasted time on stuff like this. EMS Reporting - Spend way too much time documenting how much we've done to reduce our overall usage, etc. Too many people investing time in this report. This is one EO that should go away...It's a waste of time and takes away from the important work that needs to get done. FAIR ACT Inventory - Terrible system. Can't tell which person each record relates to. Waste of time. PNET - Is TERRIBLE and wastes so much time for cardholders and their approving officials. Go back to paper, it was more efficient and we have to keep the records anyway. Another alternative - Why not buy the EAS expansion and			Consider fully utilizing space available at OWNED facilities instead of spending money on rent. Just like a home...cheaper to own than rent.		
514	513	5/3/2017	Thank you for taking the time to seek input from EPA staff. I???m a project manager in the Superfund Program with 28 years of experience, with an additional six years of experience as a contractor. My comments are more programmatic in nature and could be difficult to implement without changes to the National Contingency Plan or the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA) and/or the Superfund Amendments and Reauthorization Act of 1986 (SARA). 1)Greater emphasis is needed on the completion of cleanups and deletion of sites from the National Priorities List (NPL). In my 34-year Superfund career, I???ve only been able to delete two sites from the NPL. The process of characterizing the contamination and risks at a site and making a decision on a cleanup plan takes too long. On average, it takes about five years to make a

515	514	5/3/2017	I require an administrator that thinks anthropogenic climate change is an actual scientific truth. It's quite disconcerting to hear him belittle the organization every day on the news. Also, can we agree the "back to basics" idea is just political bullshit disguising an agenda of dismantling regulations that affect the oil and gas industry. Surely, not everyone in Washington is buying this?			Impeach the president.		
516	515	5/3/2017	The requirement to get approval from Headquarters for every press release and press response is burdensome and highly inefficient. Similarly, the need to get HQ approval for even relatively routine actions such as review of required state submissions is also inefficient, significantly extending the time required to process such actions. The amount of mandatory training should be reviewed and could probably be reduced.			Return decision-making, particularly for relatively routine matters, to the regional offices; significantly reducing the types of actions that require HQ review/approval would reduce inefficiency and accelerate our activities.	The FPPS system is outdated and inefficient. It is counter-intuitive, organized poorly, and requires an excessive number of key strokes.	
517	516	5/3/2017	I love our work flexibility - but it would be nice to not have to enter time in to a leave request and then have to enter it into People Plus (and we also have to enter it into another couple of systems due to our flexible systems). Which individually doesn't take long, but in aggregate, takes a while over the year.			Push delegations down as far as possible - less review and briefing time for senior level managers.	Electronic Records (from both the regional record center and the federal record center) that are accessible anywhere - often I need records while doing work at home and I have to wait till I come into the office to obtain the records because they are not available electronically.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
518	517	5/3/2017	The administrative tasks that are performed by the administrative staff in this region make the staff's daily activities much easier and their assistance/knowledge provides a good foundation for the staff to not have to handle all administrative duties themselves. I have worked in other agencies where technical staff also needed to complete administrative tasks and it prevented them from doing their primary duties. If anything, with turnover occurring in the administrative staff, we could probably use more staffing for administrative duties.	Better environmental results from partnerships can be achieved if funding is not cut. With the proposed funding reductions in FY18, states, tribes, and locals would be unable to perform their base duties which are required in the CAA and CWA. More money, not less money would allow for better results to be achieved. A shift in approaches can help bolster private sector partnerships, but that will not be achieved by slashing funds to the EPA.	Better customer service to SLT communities, regulators, and the public will once again be achieved by providing funding to those parts of the agency. Communication with the public is not going to be maintained if those programs are eliminated. The staff I come across doing SLT, regulator, and community work are highly efficient, and sought after by local communities. If funding is cut to those programs, there will be a large void left unfilled for those community and SLT groups.	Effective communication from senior leadership at HQ that addresses the administration's mission would provide a clear message of what the objective is. As it currently stands, there has been no reassurance by senior HQ leadership that EPA primary objectives since 1970 are being maintained. This would allow for staff members to not be worrying about potential cuts, layoffs, region closures, and would allow them to continue performing their primary duties in their positions. In terms of reducing costs, hiring more staff that have modern technological capabilities will streamline processes, while maintaining the older, institutional knowledge employees will allow for a coordination that	Updating some of the back-end administrative software with provided training can make some administrative tasks more streamlined.	Shared responsibility does not exist in the program I work in, there is oversight, and separate duties that are performed on the federal level that are different from what state agencies are doing. EPA is viewed as an indispensable source for these state agencies for questions that are not able to be answered by other state agencies. EPA's duties and activities are very exclusive and do not overlap with other scientific agencies such as NOAA, USGS, Army Corps, NASA, HUD, NIH, and others. There is not overlap with EPA, but instead, very productive coordination and collaboration between
519	518	5/3/2017	Training - we have too many trainings (Information Security, Records Management, COOP, FOIA, ethics, health and safety, etc. etc.) to take and we take them too often. The substance of the courses rarely changes. We should be able to get a certificate & be done....or at the very least take the trainings every 5 years. If there is a legal requirement, then we should have the option of taking the test first (& then not needing to go through the powerpoint or in person training if we pass). Timekeeping - get rid of redundant systems. Transit - the system we have now is overly cumbersome. We get $ on a credit/debit card, then have to transfer funds to our bus pass monthly. Either we should find a way to put the funds directly onto our bus passes or we should only have to do this annually. Performance measures/program evaluation - too many measures, too frequent reporting. Our success in environmental protection should be measured by actual environmental	We need to ensure that environmental laws and regulations are carried out. We should not assume that the new administration will change things, until Congress & the President actually change the laws. Enforce the laws and regulations as currently written. When States fail to act, we need to be ready to act in their place. We should focus on core programs and less on fluff (e.g sustainability, trash-free waters, etc.). We need to ensure that our air, water and other resources are monitored, so that we know if we are achieving results.	We need resources to travel. On the phone, conference calls and video conferencing do not replace in-person contact to build relationships.	We have some efforts that are a luxury that we probably can't afford anymore. For example, in Region 10 we have our own dive team (most regions don't have one). They use a lot of staff time, training time, travel and equipment resources - this is work that we could contract out for less money. Any of the small (15-20 people or less) field offices (for HQ, labs, ORD) should be consolidated. Paying for rent, computers and cars for these offices is expensive.		The states are already facing budget cuts at the state level, if we reduce our funding to them & reduce our staffing levels - then we will not be able to do our jobs of protecting human health and the environment. The idea that there is all sorts of duplication of effort ("fat") in the system is ridiculous.

AMERICAN OVERSIGHT

	I
518	Transparency between upper management and staff level of the direction of the company/agency. This is conducted in all best businesses and it would be useful for the HQ administrators to provide a clear and reassuring message to its staff and not to external entities. This would improve efficiency so staff is not tirelessly worrying about closures, layoffs, etc.

522	521	5/3/2017	De-regulating is unnecessary, inefficient, and damaging to public health and the environment. Re-organizing wastes time and money Eliminating staff loses institutional knowledge and long-honed skills Cutting budgets stymies work and creates inefficiencies driven by rubbing nickels together Lack of leadership stalls everything we do Answering thinly veiled surveys like this wastes our time...but, since you asked, read on.	Cutting more staff and budget hurts everyone: private sector, states, tribes and federal employees. Did you know that a large part of our budget goes to contractors? It takes EPA staff to responsibly manage taxpayers' money. EPA CREATES jobs - we don't kill jobs. Market forces are more responsible for job loss....and creation of new industries. EPA simply responds to the challenges of modernization to keep the public healthy and our natural resources productive in service of the economy.	More emphasis on vertical interactions - it takes time and money to engage with states, tribes, communities and the regulated community. And it requires trusting staff to be professional in those interactions. Provide us with the resources and the mandate and we can do it. Cut resources but add mandates and that is a recipe for failure.	We are actually already quite lean and already struggling to get our work done. If you could tell us what inefficiencies you are seeing, we could suggest how to improve them. But really the main inefficiencies comes from not investing in good technology, hiring new people with new skills and recently acquired knowledge, and keeping our skills up to date through training and professional development. Getting rid of people with institutional knowledge will set us back and create inefficiencies that stall environmental protections. To "maintain" environmental protection you have to not let up on the victories and you have to tackle the new emerging challenges. Yes, like climate disruption, population	All of our technology lags behind by several years. but again it takes money to keep up to date. it isn't a simple thing. I would welcome technological leaders to help us in this regard.	We already work together collaboratively! Let us continue! It is true though, since we all have different missions, priorities and budget constraints we are somewhat stymied from more effective collaboration. Part of the difficulty with more collaboration is driven by the congressional committee and approps structures. part of this is driven by sheer lack of resources to engage in a timely fashion and not enough flexibility to work on common ground.
523	522	5/3/2017	(1) poor relations with the state environmental agencies who may be uncooperative; (2) poor maintenance of state websites and online permit files; (3) re-reviewing cases at upper levels of management and at DC headquarters slows down the process	(1) networking events and annual gathering with state, local communities, and tribes; (2) town hall meetings with local communities; (3) encourage private sector to reach out to EPA on maintaining compliance; (4) open and encourage lines of communication to private sector to discuss environmental concerns anonymously	(1) stricter environmental regulations that will help the public and local communities; (2) providing EPA employees with information on updated industrial trends of different types of industries; (3) getting access to the documents and reports that companies provide to the states so that EPA doesn't have to ask for them again	(1) decreasing amount of time spent on sending out notices and documents to companies by not having to reroute cases to the DC headquarters	(1) new and more equipment to measure air emissions; (2) more training on certifications to use monitoring equipment	(1) having access to state files and reports; (2) form of inter-federal agency communication to share new developments and projects

AMERICAN OVERSIGHT

	I
522	There are lots of best practices for achieving environmental protection, but cutting budgets and staff can't get you there. We are at our lowest budget since 1989 and the fewest employees since 1966. What are you thinking? Again, if you tell us what you want to accomplish for environmental protection, we can propose a variety of efficient ways to do it - your choice. But if your goal is to simply reduce the size of government...well, I am not sure what we are being efficient at.
523	In the air enforcement and compliance assurance, the environmental engineers and environmental scientists are involved in the whole life process of each case, from inspection through to the end

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
524	523	5/3/2017	There should be fewer restrictions on how staff can use social media and other opportunities to get our messages out. These restrictions have become more onerous over the years and now that we are for the most part unable to send out press releases, it is very difficult to communicate effectively. I would decentralize the press function out of HQ and allow regions to message directly to their partners through frequent twitter/facebook feeds.	EPA/States/Tribes should convene regular conversations to discuss each other perspectives- and not just at the senior management level. EPA should not be the ones to organize all of these discussions. The responsibility should rotate.	On the whole, I think we do provide good "customer service". I take issue with the way this question is premised on the idea that we are not responsive and do not have good relationships with the public and others. The best way to provide "customer service" is to develop relationships. Relationships are best developed in person and are maintained by regular/frequent interaction that doesn't only occur when we have difficult issues to tackle. This means regularly-scheduled meetings to discuss common goals in person. It also means listening to all perspectives - which the current administration seems - to date -unwilling to do as it may up-end some of the preconceived notions about EPA and its employees.	The Superfund cleanup program needs to be more aligned with the Brownfields program. Part of the reason it takes so long to clean up a Superfund site, is that in many cases we are cleaning to extremely stringent standards that do not result in risk reduction. We must align our cleanups with future land use and work closely with local government and organizations to realize redevelopment. We also need to ensure that sites that present the highest risk to human health and the environment get addressed first -which are often sites that do not have a Responsible Party and the Superfund Cleanup Fund is tapped out.	We should not always purchase the cheapest version of software. In particular, we spent a lot of effort on rolling out SharePoint, but we purchased the version with very few capabilities and then we don't have an IT workforce that can support employees. This is also true of our travel software, Concur and our payroll software, PeoplePlus.	In general, I think we can partner more closely with other federal agencies on common issues. This needs to be done at all levels, and not just at senior leadership. Regularly scheduled discussions where the organization responsibility rotates among agencies is a good way to achieve this. I also think referring to entities to whom give money as partners is a misnomer. While I do think it is very important to collaborate to achieve common goals, the fact is, we provide significant funding to states and we have a responsibility to ensure that it is spent wisely. The states are able to carry out many activities, but not all of
525	524	5/3/2017	We are required to do lots of reporting on meeting where the public may attend - this wastes time and seems to be for no purpose. We report on measures and the measures do not seem to be an accurate assessment of the environmental benefits. management spends a lot of time tracking people's time and making sure that employees have signed and attested their time card, and that the supervisor has approved. 1-3 hour every other week per unit is spent on this. Amounts to hundreds of hours every pay period. Also, to make changes to a leave slip that has been submitted, the supervisor must locate the leave slip and return it to the employee. This is new, and a big time waster for all. the employee should be able to retrieve, make a change, and return for approval without involving the supervisor. Time Waster!!!!	The EPA can play a stronger role in bringing partners together and having the partners develop solutions that will improve environmental conditions. At every level, EPA should be encouraged to foster relationships. In particular, EPA would be a more trusted agency if stakeholders have the relationships with EPA personnel. Especially with agriculture, there has been so much misinformation spread and EPA has not take an active role to tell the story. If people knew us, and trusted us as individuals that work for EPA, we would have better results. EPA has allowed outside organizations with an need to gain power over a voting block, to spread mistruths about our agency and what we are doing. This would not have happened if the relationships were there. So, travel money and a mandate to make sure that EPA personnel are out in the	See Q. 2	NRCS has a great program - Soil Health. Good for the farmer and for the environment. Saves $, more crop, less pollutants run off. Most state env departments are unaware of the benefits. EPA works with state environmental departments and can help tie all the players together.	Soil Health as a process. Internal to EPA - more transparency around what happens in EPA. We are still very stove piped to this day. However if I could see what other programs are doing, via the emails that are sent, I could see where my program can connect. There is the technology to do this.	EPA should have the ability to sit down with other agencies - such as BLM and BIA to simply talk about what they are doing and how we can interact. Currently, there is somewhat of an 'embargo' from reaching out to other agencies and sharing information. We don't do the same things, but we may share mutual goals and could more effectively align tasks so that we are not at odds, or we can do more with less money if the activities were knitted together.

AMERICAN OVERSIGHT

	I
524	We should not be outsourcing all of our IT work. It costs the agency more money and we get much worse service. In particular, our shared service agencies are overworked and don't know enough about the work we do, to provide good customer service. This is especially true in the hiring process.
525

526	525	5/3/2017	Burdensome Freedom of Information Act process. A typical request is overly broad requesting all emails related to a project or a specific issue. This can be a massive time drain with little useful information provided. Streamline with direction to minimize time working on information searches and stricter policy on the requestor narrowing the scope of the requested information. Loosen the requirement to scan massive reports and electronic FOIA online uploading that is another time consuming process with little value.		Reduce tribal consultation requirements when there's no clear nexus. Tribal concerns can be unfounded and used to discourage decision-making.	Reduce management layers.		
527	526	5/3/2017	Administrative Requirements: Employees who work "credit hour" schedules must fill out a separate spreadsheet chronicling their hours and leave, even though all of this information is recorded in People Plus. Duplicate paperwork for no reason. Also related to People Plus; employees are required to "attest and submit" before the end of the pay period. For Superfund workers, this means they must go back the following week and add in billable hours worked at the end of the week. This often leads to lost billable time.	We work very hard to build relationships with all of these groups. Limitations on our ability to travel makes face-to-face meetings less frequent and causes us to be less effective in doing so. Especially with states, tribes and communities, they cannot afford to travel to see us; we used to travel to see them but not as much with budget restrictions.	With regard to the public, we need to increase communication so the public understands the full range of services and information available from EPA. For this purpose, up to the minute web presence and frequent press releases and other media outreach are crucial. As to states and tribes, we again need to be able to connect face to face whenever possible, as appropriate.	We have been engaged in "leaning" process as much as possible and have achieved a lot of efficiencies, such as cutting out redundant steps in the grant process or the FOIA process. We should continue with those honest efforts to streamline process at the Agency without sacrificing environmental protection. At the same time, we cannot sacrifice substantive environmental standards in the name of reducing cost or achieving efficiency.	The Agency is increasingly inundated with FOIAs and with litigation discovery requests. In the electronic age, this can lead to crippling, time-intensive and labor-intensive efforts to search for and produce documents. We have substandard software for these purposes and this leads to waste of time and resources. This is not "new" technology; just technology we can't afford or don't invest in. Similarly, our computers and software are often old and outdated.	Our mission allows us to work collaboratively with other federal or state agencies in many areas. One area that is always contentious though is where the state or federal agency is a liable party. We often find that other agencies or states lack the budget to work cooperatively with us or with the private sector on cleanups that would be efficient and effective and a lot of time and effort gets spent resisting responsibility rather than stepping up, because the states and federal agencies can't afford to do otherwise. Relationships are damaged in this way. Adequately fund federal agencies to handle their

528	527	5/4/2017	The yearly required credentialing and training process is now so burdensome that if an inspector were to "maintain" credentials in all required fields of expertise for a "multimedia inspector" they would spend the entire year doing nothing but training and would never be able to conduct a single inspection.	Individual inspectors rarely team up with local Health Department agencies. We will deal with state agencies regularly but we hardly ever interact with county of city personnel. We appear to have a very poor local government outreach program.	Have a better relationship with the local inspectors within that community. This way a federal employee can understand the local community needs and desires.	The EPA conducts a security screening of new employees no matter what. Even if the employee already has a security clearance through the military. OPM is in charge of both DOD and EPA background checks, but they demand on doing a second background check even if the employee already has a current security clearance through military service. This policy is not just with the EPA, but with many federal agencies.	We are pretty lean in this regard, but a possible improvement would be to use more ambient monitoring stations with centralized data collection through existing commercial networks. This could potentially reduce the number of field visits required.	Two thirds of the agency is stationed inside Washington DC. How can you be a national agency when two thirds of the organization is inside one city?
529	528	5/4/2017	The HR process historically has been long and drawn out due to backlogs at the Shared Services Centers. While I understand that hiring will not be a priority in the near future, it would be helpful to have the centers well staffed in order to keep things moving. In addition, when changes to internal process are being made, it would be helpful if these changes are discussed with the stakeholders BEFORE decisions are made. For that matter, there should be a collaborative approach for infrastructure changes in general. Doing so will save time and money associated with having to reverse the changes after they've been found to be ineffective and not efficient.					

AMERICAN OVERSIGHT

	I
528	The EPA sends two inspectors to each site for "safety reasons." When I worked for local government they sent one inspector to each site and if there was a problem they called 911.

530	529	5/4/2017	for bankcard holders, the P-Net system is redundant and VERY time consuming. It has at least DOUBLED the admin work associated with EVERY bankcard purchase. The bankcard is just a tiny portion of my job duties, but it is the most time consuming. ALSO, I deal with the Environmental Management System (EMS). I pay monthly water, gas, and electric bills for two locations, then post the cost, date, amount used, etc. to the EMS database for quarterly reports. This is VERY time-consuming for unknown benefit. I also pay for daily fuel charges for all our vehicles. In addition, I post the miles driven, amount of fuel purchased, gallons purchased, etc. into the AMS system. Again, very time consuming for unknown benefit. I also process Purchase Requests in EAS....again, the requirements for the mountain of paperwork is overwhelming: 508 compliant, Sole Source Justification, FITARA approval, quotes, market research, etc. The list goes on & on. The purchasing process should be streamlined. Also, RAISE the limit on the	unknown	unknown	reduce the worthless, over-whelming amount of paperwork associated with every purchase. Increase the limit of the purchase card to at least $5K, which would eliminate some small purchases being sent to the contracting office (a PR must be prepared in EAS for every purchase in excess of $3500). When we make a small purchase on the bankcard, even if it's $10, the originator creates an order form and signs, gives to his supervisor for signature and before I can purchase, I get my approving official's signature. This goes on for EVERY purchase. In the field unit, the MAJORITY of their purchases are tiny: bolts, screws, hoses, etc. to make repairs to boats, generators, equipment. The volume of paperwork	unknown	unknown
531	530	5/4/2017			EPA could consider going to a one cleanup approach/standards.that would merge RCRA Corrective Action, Brownfields, TSCA, USTs, and Superfund. Currently industry at times has to implement 4 different cleanup standards with completely duplicative but unique administrative processes and obligations to come into compliance at one property. Such an approach working closely with States would save significant time and money while speeding up cleanup providing better protection. In addition EPA working with States could come up with a prioritization process that would prioritize High risk sites based on contamination concerns and regulatory concerns. Sites with low prioritization should be made eligible for State Voluntary Cleanup programs. Currently property owner cannot easily if at all cleanup PCBs, Tanks, nor address RCRA Corrective Action via a State voluntary cleanup program due to eligibility concerns.	-rebuild Multimedia core of inspectors. Having a core of inspectors assigned to a centralized work unit in each region trained and credentialed to conduct 3+ types of inspections (e.g., one inspector could inspect for compliance under CWA, TSCA, and SPC		See answer to Q4

532	531	5/4/2017	My apologies, however, I do not have a sufficient level of trust in Agency leadership to allow me to answer these questions. I am concerned that no matter what answers I provide regarding activities that are effective or ineffective, there appears to be a substantive probability that the answers will be used against the mission of the Agency and against what I believe to be best for America and the environment.					
533	532	5/4/2017	The biggest issue in preventing me from doing my job is any side-tracking away from the EPA's mission of protecting human health and the environment. Any stakeholder pressures and/or political whims that take the focus away from the mission impedes all progress towards meeting our mission goals. Addressing this issue is simple... EPA should stay focused on its mission of protecting human health and the environment (while still considering stakeholder concerns) - that should be the priority; all other political and stakeholder pressures should be secondary.	I think that increasing the interactions and improving the communication among EPA staff and management from HQs and EPA regions could improve our process. HQs is needed to ensure human health and environmental protections at the national-level, but to implement the national-level protections, the regions are needed since they are the 'feet on the ground' for enforcement and localized implementation of protection goals.	I think that customer service involves making sure that stakeholders are heard and their comments and concerns are considered. EPA already has a very robust approach for incorporating feedback from stakeholders throughout our processes.	The biggest change that EPA could make to reduce costs and inefficiencies, while still maintaining environmental protection for Americans, would be to put Americans first. Our mission is to protect human health and the environment and not to aid industry and big business - there are other agencies in the government that have primacy over that. Focusing on issues not related to our primary mission creates confusion and inefficiencies.	One improvement would be to make all of the data used in regulatory decisions publically available. Currently some data are only available via FOIA requests and FOIA, although valuable, is not a very efficient way to share information.	The work done in my office is unique to EPA, so I'm not aware of any opportunities for 'shared responsibility' with other federal agencies or states. However, there could be 'lessons learned' from other organizations - e.g., there could be processes/methods that are working very well in other regulatory agencies that could provide insight on process improvements for EPA.
534	533	5/4/2017				At some point we have to put on our taxpayer hat and question the practice of 100% telework. A few days here and there, but not 100%. People need to come into the office at some point.

535	534	5/4/2017	Lack of dissemination of information from the Administrator's Office. We need things like the Administrator's Priorities in order to respond to a request for quarterly measures. Kind of hard to map the measures to the priorities when you don't have a copy. The link to the priorities on the EPA.gov webpage is broken. This is just basic management here.		See #5 below.	In Region 4, we have a large amount of FTE resources being used in our EJ Office and with an initiative to partner with minority institutions. The EJ office spends a lot of travel resources and overtime hours, but there have been little to no results. We have the largest EJ office in the country, mostly pushed by the last 2 Regional Administrators. Also, the 2+ FTE that travel to minority academic institutes and sign agreements with them use lots of resources. Although we have these agreements, not much work has been achieved through them.	We have been working on moving inspectors from a paper-based process to an electronic one. This would speed up the pace of inspections and provide the facility with information on getting back into compliance quicker. It would also be much more efficient from data entry stand point and provide a higher quality of data in our systems. We have been working jointly on this project with ECOS under the E-Enterprise for the Environment. The contract for the initial phase is close to being let, but we have no additional funding to see this project through to more programs - right now it is only funded for RCRA.	In Region 4 and in a couple other Regions, there is no central enforcement office. Activities are managed through a coordinating office so that the Region has one voice when communicating with States, tribes and HQ. This is an effective way of operating but not very efficient. We have to coordinate among 4 different divisions. Each time information is needed, we have to disseminate it out to the Divisions, then get their responses, massage it into one voice and then transmit it. Other things like screening cases for multi-media or criminal have to be done through individual meetings instead of at a weekly
536	535	5/4/2017	Disdain from the Trump Administration and Administrator Pruitt prevents us from doing our job efficiently and effectively. Our work is depicted inaccurately and it appears to be willfully ignorant. This is a harmful distraction from our mission. I would address this issue by pleading with Administrator Pruitt to provide leadership for us to continue protecting human health and the environment rather than undermining our hard work. Our salaries are paid by the American people to protect them. Thank you for taking the time to seek feedback and for reading this comment.					

AMERICAN OVERSIGHT

	I
535	In working with our State Partners, Region 4 is really a model. While some of our States may have issues from time to time with activities we are undertaking, we have a good enough relationship in the enforcement program to have those adult conversations and maintain mutual respect. We work very hard to keep communication lines open and ensure there are no surprises when it comes to interactions with our States. I think the results of our State Review Framework reviews, the data verification stats and other evaluation tools show just how strong our States are in the Southeast at least when it comes to the enforcement program.

537	536	5/4/2017	Fix OARM. Set up a (or fix the) ticket-request system for OARM, like how EZ-Tech tracks help requests. OARM repsonse to emplyee help requests should be tracked for service response. IMPORTANT - the tracking system should be set up to that OARM employees can't just go in an mark tickets as COMPLETE when they just don't feel like responding any more. OARM staff need to act like they care about doing their jobs, because they don't act like it. OARM service and response to employees is really bad. They are slow to respond to questions about training or other HR-related things. God forbid you need to find out something about payroll, eOPF, retirement process... you get told "it's not my job" or "I dont' know" or "I'll pass along your request" and it goes into a black hole. You get the feeling that you are BOTHERING OARM IF YOU NEED HELP. DOES OARM MANAGEMENT	Consider the VALUE of regulations, not just the costs.				
538	537	5/4/2017	Hiring new staff, particularly Peace Corp graduates, should be prioritized. The longer it takes to hire them, the higher the risk that they will take other jobs. Also, the previously standard annual move up ultimately to a GS-13 will keep these exceptional individuals at EPA.	Partnering with states and tribes as well as with the private sector has been very successful for EPA and partners. It should continue.	Having funding to visit states, tribes and the regulated community on an annual basis would make a huge difference for these important stakeholders and us.	I am not aware of high costs or inefficiencies that require resolution.	Yes. An electronic recordkeeping system that works for the entire Agency would be invaluable. ECMS and SEMS for superfund material and any other systems that are already doing this work can co-exist. We need a central organization looking out for EPA rather than focusing entirely on NARA.	We have done great work in eRulemaking by offering FDMS to other agencies. In addition, the availability of FOIAOn-line to other agencies is of great value to those agencies who are our partners. If we can find other areas where we can share our capabilities in the same kind of way, we should do it.

539	538	5/4/2017	The human resources process is very limiting and OPM policies are interpreted extremely. Even with OPM programs to attract critical fields of IT and Cyber security, the organization does not competitively go after the best talent. This leave the agency with second tier talent that prevents the organization from doing its mission. Getting an organizational change even at the lowest levels is long. We have process for the sake of process and protecting the status quo. This organization needs organizational lean six sigma processes to lean out processes. In addition to HR, the acquisition office is severely understaffed and is unable to move in an agile fashion. There are many Agency doing agile contracting, but EPA cannot get anything in a timely fashion out the door. This hamperas the ability to deliver services which impacts the customer. It starts with contracting.	IT supports every single part of the agency. IT is hampered by cyber security but this is due to habitual underfunding of IT and Cyber security. There are many things that cyber can enable to "achieving better environmental results from partnering with states, tribes, local communities, or the private sector" but this requires leadership to funding, strategic planning, structuring and staffing IT appropriately.	We are in need of trusted connections to "states, tribes, local communities, the regulated community, and the public at large", we need collaboration suites that can work securely inside and outside of the EPA network. We need to consolidate our web presence to send a single message that has consistent messaging. We need a way to engage these communities and properly review, staff, fund and plan needed initiatives.	IT consolidation. Every program office and Region has an IT arm. There is significant redundancy throughout EPA and Millions of dollars in savings to be realized. This is a HUGE undertaking and should not be approach in a lackadaisical manner. This requires hard decisions by leadership and planning to ensure that OEI can raise the level of service and quality as this is undertaken. That will mean creation of a competency model, robust governance and increase of funding to deliver optimal results. The framework exist from FITARA. This will be transformational for the EPA if done correctly but will take years and will require both strong political and career leadership for the next few years.	Collaboration suites, mobile applications, trusted platforms, etc. There are so many but to adopt this posture requires the EPA to get their IT infrastructure healthy and robust to be able to handle the changing requirements.	The current environment cannot support full automation across the enterprise. Development work should be centralized, IT Operations should be centralized, cyber should be centralized. Then the Program Offices and Regions can focus on the environment and OEI can build the necessary expertise to deliver the mission.
540	539	5/4/2017	The nearly absolute lack of communication between new political appointees and career staff is severely and negatively impacting my ability to do my job efficiently or effectively. For example, the shutting down of websites while reconsidering content without discussion with affected programs and without providing direction on what programs are to do with ongoing work intended to flow through those websites results in massively inefficient and ineffective efforts by program staff. The Administrator in his one and only address to career staff, 11 minutes in duration, stressed the importance of listening, both in his listening to career staff as well as career staff listening to him. Yet, other than interaction w/ Acting AA's, his and his senior staff's interaction w/ career staff has been virtually non-existent. How would I address this? I would prioritize staffing of political appointee slots and re-prioritize Administrator and his senior staff time to meet w/ career staff, become educated on programs and

Rely on science, not politics, to develop policy.	Rely on science, not politics, to develop policy.	Rely on science, not politics, to develop policy. Upper management review of working papers, Federal register notices, training requests, and just about everything is burdensome and taking way too long.		Rely on science, not politics, to develop policy.
542	541	5/4/2017	The contractual review process is tedious and understaffed. It took me 6 months and a special request chit from our IOAA to get a priority completion for a $13K contract. My guess it took several thousand $ of staff time and tracking to get this through. Staffing and some tracking process on line with limits for each step might allow and push things forward. Tiering so that trivial contracts go through with minimal but adequate check and balances to ensure ethical issues. In my 33 years in EPA the process has encumbered by a factor of 10 at least.	There already is a lot of state and local interactions - mostly done as daily activities and cooperative efforts. Most is below the radar of senior folks at the Sate and Agency level who generally are not here long-term and don't see the granularity of staff efforts. Most folks feel this is essential to the Agency mission. As with everything, there could be more but many state and local activities are ad hoc needs and requests. As such, with monitoring of performance metrics set up in planning activities and OMB assessments of progress (by meeting these metrics) there is an embedded disincentive to address many ad hoc needs which when complaints rise up to those who don't see what already exists get the impression there is lack of responsiveness - this is a design flaw in management control to meet strict metrics. I don't have a full solution but part of one would	See above. provide also incentives which include funding to support that does not cut into the pre set plans that have established and funded tightly. In the last 10 years the program I'm in focusing on air quality has lost 30% of staff and more of funding - especially if inflation is included. The demand=s have not decreased.	Most costs and inefficiencies have been accumulated management controls over the last 25 years. Having been here for longer than that period, I've seen the layering of oversight upon oversight and the disincentives applied to innovation and straying out of the box. What comes with this is a lack of trust that pervades from top to bottom and bottom to top. Clean up the excesses of oversight and apply true accountability rather than lip service to that end with over management. Problem is that there are those within the senior levels of the Agency and at the political level who look only to critique for self gain - no matter what administration is in power. The energy and trustworthiness of the	These would come about naturally and in fact mostly exist. is the system or process and oversight that needs attention.	Moving things around and reorganizing is an excuse for dealing with issues. I've been a senior manger in the Agency for a long time and this panacea is a Spruce Goose of optics.
543	542	5/4/2017	There are no administrative nor management, nor organizational processes that prevent me from doing my job.	We have good working relationships with stakeholders in Region 8. We partner with them to achieve environmental goals. Current regulations help to define mutual goals.	Provide EPA with an appropriate budget to permit us to do our job and to hire and keep the best professionals. EPA's budget is very small compared to other federal agencies. A little here can go a long way to protect the environment and the health of the American people.	Provide EPA with an appropriate budget to permit us to do our job and to hire and keep the best professionals. EPA's budget is very small compared to other federal agencies. 544	543	5/4/2017	We are forced to have many, many needless meetings. For example, our section meets every two weeks whether or not it is necessary. The worst offenders are our managers. They spend countless hours huddled together is secret meetings. Why do they need to send so much time meeting? What are thy doing? Every meeting without exception should have an agenda that is distributed prior to the meeting. At the end of every meeting there should be a survey to determine how useful the meeting was and whether or not it accomplished its goals. If a meeting is not needed it should be canceled.	The environmental issue of our age is climate change. Scientists now say that 80 percent of the monthly and daily events where heat records are exceeded are directly related to climate change. The path that we are on to deemphasize and ignore climate change will result in incredible suffering for humanity and massive environmental upheaval. Indeed we are already seeing the effects and they will continue to grow exponentially. The current administrations position on climate change is anti science and will hurt states, tribes, local communities and have devastating impacts on the private section. Addressing climate change must be the number one objective of EPA in order for us to achieve better environmental results. EVERY action EPA takes should be measured on how it helps to address the issue of climate	One of the worst things that has happened in the last few months is to have an Administrator appointed who has fought EPA efforts to protect human health and the environment in fourteen lawsuits designed to cripple our activities. Now that he is inside the Agency he seems to rarely miss an opportunity to slam our work. "Back-to-Basics" has become a code phrase of carrying out a political agenda designed to cripple the agency. The most useful act to improve our customer service would be to get rid of the political cronies and the political agenda designed to weaken the agency.	At my location we have needless layers of managers. They consume huge amounts of resources because they all have to have huge travel budgets, and large offices and produce almost nothing of use. Almost none of them have educational credentials that match what they do. We need more resources directed to staff and much less toward layers of bureaucrats with huge offices who don't appear to do much.	EPA travelers are forced to use CONCUR for making authorizations, travel reservations, and submitting vouchers. The CONCUR software is very poorly written and difficult to use. Sometimes I have to spend almost as much time as I spend traveling trying to deal with CONCUR. EPA should not purchase software that doesn't work well. It may have been cheap to purchase but CONCOR is huge waste of resources.	
545	544	5/4/2017	Purchasing supplies & equipment are difficult in Cincinnati and the process needs some tweaking. The only individuals with a purchase card in Cincinnati are in EMMD. I've gone to them a few times to ask about purchasing something and have been told that I have to go through my division in order to get something ordered. However, no one from my division has a purchase card here in Cincinnati, so supply orders are time-consuming and complicated (e.g. the Cincinnati card holders can order us office supplies, but not computer supplies, etc.). Either every division needs to have a purchase card holder at every location so each division can take care of their own supply/equipment orders, or there needs to be something in writing that states that supply and equipment purchases are done on a location basis, regardless of which division a person belongs to.

546	545	5/4/2017	Approval of budgets(State Allocations) in a timely manner.	More community outreach initiatives based on the mission and goal of the EPA.	More community outreach initiatives based on the mission and goal of the EPA.	Yes. Removing the threat of government shutdowns will always reduce costs and improve any inefficiencies.	No additional comments.	Remove barriers on data sharing between federal agencies.
547	546	5/4/2017	There is a great need to streamline the procurement process for EPA getting work done by external contractors. The current process is overly bureaucratic and actually costs the Agency money in numerous delays in getting new contracts awarded and funds placed on existing contracts. This waste taxpayer money, but also delays getting useful funds to the private sector doing much of that contracting work. There seem to be too many hurdles in the process and not enough staff in the procurement office to make these actions move quickly.	I think EPA does a tremendous job interacting with our state, local and tribal partners. One way we can improve upon that partnership is to increase the travel funds for EPA staff to have more face-to-face interactions with those partners. Video and conference calls are great, but nothing enhances a relationship better than the opportunity to have face-to-face interactions and getting our policy and technical staffs more engaged with our partners would be a great improvement.	Again, we do a good job of that already, but more interaction with those folks will lead to better customer service. There is also a great need ot increase state and local grants, specifically in the ambient monitoring area. Equipment is now dated and old, staff resources have decreased significantly over the past 10-15 years and as a result data quality is suffering. States regularly complain to EPA about needing more resources in these areas to better manage their programs. Also, EPA programs tend to be very territorial and we could provide much greater customer service, if for example, data reporting programs were more coordinated across program offices. We routinely run into stovepipe programs that refuse to work closely with other similar programs and thus we often duplicate effort with our state	Again, streamline the procurement process will save money and make for cheaper and better environmental protection. Reduce some of the mandatory training required for staff that is often not applicable to their jobs, yet takes hours of their time to complete.	EPA continues to be a leader in evaluating new technologies and routinely, the hold-up on those is the legal challenges, not the technologies.	EPA does a great deal of leveraging technical work with both NOAA and NASA and well as other Federal agencies like the NPS, USFW and UFS. The scientist in all of those agencies are keenly aware of the individual skills and talents in each agency and we routinely work together to share those expertise. More easy ways of formalizing those partnerships would be helpful and support from senior management within the Agency would also be helpful.

AMERICAN OVERSIGHT

	I
546	No additional comments. Stop the threat of shutting down the government and stop cutting the budgets.
547	To be honest, we work closely with all of our stakeholders and currently utilize many of those best practices in our daily work. Over the last 10 years or so with declining resources, we have made great strides to bring new technology into our work, leverage work by others in both the government and private sectors and are actually doing much more work with less resources today that we ever have. There is no lack of interaction with all stakeholders in looking at new technologies and practices. The biggest challenge is often, to get a long-term win on a best practice, you need to invest some up front capital and historically, EPA has been risk adverse to investing money in the short-term for

548	547	5/4/2017				1. Increasing the use of Telework and "hoteling". This could reduce the agency's office space and save the government money. Increasing the use of telework also has many other benefits including; easing traffic congestion, reducing gasoline usage and air pollution, saving money for the employee (reduced transportation costs), improving job satisfaction, and the ability to continue operating when there is a weather event or emergency. 2. Eliminate or reduce the amount of mandatory training (i.e., e-learning courses required through skillport.com). I have no idea how much the agency spends on these e-learning courses, but they are		
549	548	5/4/2017	With the change of administration, I have not been able to move forward with my assignments due to micromanagement scrutiny that has passed down through all levels of management before it goes to the administrators office for release. These are simple regular assignements that help businesses to operate legally with permits that normally would be processed timely are now taking two to three to four reviews internally from supervisors to legal counsel etc etc etc. Morale is extremely low in the section	Give the top level managers empowerment that should pass down to the regional supervisors and staff	We try our best to explain why the delay in providing decisions from management in writing!!!	Yes reduce the micromanagement and levels of management . Never seen so much micromanagement in private industry. Even my counterparts in private industry find it hard to believe that senior profession staff that are licensed are not empowered to make any decision. It is only " managers" not even first line supervisors. This " power " element needs to go away to make the agency more efficient.	The technology to make processes more efficient are used in business is LEAN. However the assigned leaders are totally inefficient in employing this technology in the region and also at EPA. It would appear that the upper level managers and decision makers at EPA only adopted the LEAN technology for their performance indexes- not to improve or empower the agency staff. So unless empowerment happens and the " power" of managers and levels of management in the agency is reduced- I do not see any possible improvement. They are the roadblocks to improvement at EPA	Communications- Real communications. Staff between agencies always communicate openly and have trust between them- once again the issue is the " management" whose only concern appears to be the " performance factors" frankly put- extra bonuses and money in the pocket

AMERICAN OVERSIGHT

	I
548	
549	Yes : Stop micromanagement practises. Empower the staff that know the real issue- Failure results in the Michigan where the EPA Region 5 staff told his supervisor and management the concern and it got lost in the Region 6 management administration because they were keen in fullfilling their performance goals rather and wished this trouble will go away. Power given to these managers definitiely need to decrease especially when managing " professional talented employees that have multiple college degrees". Managers need to have sufficient capabilities in managing " degreed professionals- Many are totally raw and have only

550	549	5/4/2017	The current acquisitions process hampers me from my job. Even with all approvals it took over 2 years to purchase some software that will help our office mission. I just got notified that even though my license does not expire until December I need to submit a PR for renewal - close to 7 months just to process a renewal seems a bit extreme. Additionally, access to various tools we use to monitor the Agency for cyber security issues takes several months, again even after all approvals have been received.		Inclusion of other groups when attending meetings, conferences, etc. with external entities. I am in OISP (Cyber security) and we frequently get questions from other groups that came from the states, tribes, etc. If we had been included in the original meetings/discussions this may have increased efficiency by being able to answer questions then rather than later.		More sharepoint staff resources; a BYOD policy; from my perspective the acquisitions process needs to be modernized	
551	550	5/4/2017	The 5 tier PARS system we have. Its too difficult to parse performance into 5 tiers; too much pressure to inflate ratings. And, having Minimally Satisfactory as an acceptable level sends the wrong message. We should get rid of MS; perhaps go with a 3-tiered system - failing, successful, and outstanding. We can also streamline addressing poor performance by eliminating the PAP aspect prior to PIPs, and shortening the PIP time to what is required by case law.					
552	551	5/4/2017	Why do we have THREE time and attendance reporting systems? It is ridiculous.					

AMERICAN OVERSIGHT

	I
550	Cybersecurity staff should have access to tools that are needed to monitor and identify security issues so more proactive steps can be taken. Currently this does not happen or it takes several months (still not achieved as of this survey) to get this access. Also a best practice is to have some sort of content filtering capability, to include some level of monitoring, for blocking common attack vectors of malware.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
553	552	5/4/2017		We need more travel dollars. Building effective, trusting relationships with our partners is critical to achieving the next level of environmental protection. We need travel dollars to have that face-to-face time to effectively discuss issues, address challenges, and celebrate successes. More travel dollars is a resource that we MUST have in order to partner with our states, Tribes, local communities and the private sector.	We need more travel dollars to build effective partnerships with our states, Tribes, local communities, the regulated community, and the public at large. We need that physical presence, to be there for public meetings addressing environmental challenges, and to celebrate successes.	By working off-site more often - ie, telework and/or flexiplace, that allows for more time during the day devoted to actual work - not sitting in traffic or on a train commuting back and forth to the workplace. By working offsite more, we can reduce our physical footprint (office space needs), and reduce traffic, but increase our productivity and actual work time, to be more responsive to the American public that we serve - communities, industry, and the public at large.	Again, more effective use of the telework/flexiplace program would allow us to be more modern, efficient, effective, and therefore accountable to the public we serve.	
554	553	5/4/2017		EPA could develop more electronic tools, experimental test methods and alternative regulatory standards that would allow states to have more flexibility in running their own programs while achieving equivalent or improved environmental results. EPA has vast internal technical knowledge that could be more directed towards assisting states.	There should be more staff level meetings between headquarters staff, regional office staff and state agency staff so that knowledge and ideas can be transferred and emerging issues can be communicated to EPA via EPA staff briefing EPA management.	Telework should be treated equivalent to working the office. Those who are teleworking should be effective at using Skype/adobe connect/email/call forwarding to communicate with their coworkers. Once teleworking standards are improved, the agency could then reduce physical footprint and "drain the swamp" allowing employees to live at remote locations with full time telework. ORD should be realigned or in some way prioritized to actually help program offices meet program office and state needs. There is currently a negative opinion of ORD amongst many staff in my program office and this is counterproductive to collaboration. Improved	Telework should be used more effectively. There should be a system in place so that staff are aware of who is teleworking and existing services such as adobe connect and skype should be used more effectively.	

AMERICAN OVERSIGHT

	I
553	1) Increased use of telework and flexiplace options. That would reduce cost for office space, and allow employees more work hours each day to be more productive, more efficient, and therefore, increase our accountability.

	A	B	C	D	E	F	G	H
555	554	5/4/2017	The inability to hire replacements before people retire or leave is extremely hindering because often times there is no training for certain aspects of a position and no one to provide insight. This makes new-hires inefficient. Making an effort to preemptively hire would help fix this.	none-regional staff would be a better resource for this.	none-regional staff would be a better resource for this.	ORCR has already been working on making processes and procedures more efficient, and has been using SharePoint to distribute fact sheets and example documents for employees to use, which has reduced the number of people who need to train others on routine duties.	All of the computer systems that EPA uses (concur, people plus, EAS, webforms, etc) are the opposite of user friendly. Upgrading these systems and integrating certain ones would make things much more efficient. Employees would spend less time using these systems, which would save money.	increased collaboration with other federal agencies
556	555	5/4/2017	Getting our routine federal register notices generated in the region reviewed by OGC and HQ offices seems wasteful. We should be trusted to understand what the regulations are and be able to send our notices out without this extra layer of review. HQ and regions should come up with a system that identifies only those most critical scenarios where extra review is needed. I would imagine the amount of notices needing review could be cut in half, if not more. I understand being cautious about setting legal precedent, but in my experience, there is too much caution.	Have EPA employees interact more with those in the private sector. If more EPA staff understood that those in the industries we regulate were interested in their economic and environmental well being, we would do our jobs better. Too many times, industry is viewed negatively. These are real people with real jobs and sometimes we fail to understand that. Of course, bad actors should be prosecuted to the fullest extent of the law. Some examples of how to improve this relationship would be to set up "technology sharing" workgroups. Industries that emit wastes are interested in technologies to clean up or reduce that waste. So are we. We should convene workgroups to study and pilot test various innovative ideas and write reports showing how well it may or not work.	We should get out and do more face to face interactions. We have grown too dependent upon email to communicate. We should encourage employees to give talks and presentations to all audiences, including industry and business conferences. Trust the staff in the regions to know what our message is and communicate it effectively.	Try to do something about the clean air act that reduces the amount of federal register notices that deal with non-environmental issues. For example, infrastructure state implementation plans are really more for paperwork or administrative issues. They do not really get at reducing air pollution in the real world. We seem to get sued for not following this part of the act and it takes time away from dealing with real nonattainment air pollution issues when we get bogged down with minutia. There has to be some common sense solution to concentrate our efforts on what really matters for the environment.	The move towards electronic filing and submittals from our states is a good step. We should expand those efforts.	There should be more interaction between DOE line engineers/scientists who understand how the power grid operates in this country and EPA line staff who understand how harmful pollution forms from large sources (especially coal fired power plants). There is some promising research trying to link turning on and off various sources during expected ozone conducive conditions (i.e., low wind, hot, sunny summer days). A workshop that brought together experts from the EGU industries, DOE and EPA would help further this research along and put it into practice. We should be able to see real

AMERICAN OVERSIGHT

	I
555	Leaning internal administrative procedures and then communicating them in a way that is easy to understand. Using the website to communicate with the public by routinely updating the content and maintaining mailing lists for certain topics.
556	Create more workshops that emphasize that there are always trade offs when it comes to risk. We need to better communicate to the general public that complete elimination of pollution is unreasonable. Explain that small amounts will always be part of reality. Also, that exposure to pollution is the key, not just the fact that pollution exists. If we can communicate this risk message better, people will understand. Just like they understand the risks of smoking, riding motorcycles or jumping out of airplanes. We should emphasize that it always comes down to cost. How much are people willing to pay for reasonable environmental protection? People will get it.

557	556	5/4/2017		One private sector element of vital economic import to the United States is agriculture. The USEPA does a horrendous job of "regulating" pesticides, using incoherent, every changing scientific bases, to obscure a decision-making process that owes to executive branch politics, changing thru the years. Recommendation: Pesticide registration should be moved back to the Department of Agriculture! Recommendation option 2: outsource pesticide registration and application instructions to the Chemical Manufacturers Association. Either recommendation can allow farmers freedom to choose how to run their own businesses. Farmers can then freely choose to use pesticides, if they think this confers net economic benefits, or	Similarly, the mission of registration of new chemicals should be moved out of the USEPA. Registering new chemical formulations is important for society, but EPA employees disparage all industrial chemicals, not appreciating that all molecules are toxic if served to a rat at tremendous doses, even molecules that are natural and comprise our foods. Chemical registration could be moved to a Chemical Safety Board or even be outsourced to the Chemical Manufacturers Association to perform on its own, at zero cost to the Federal government. Let manufacturers take and accept liability for their products, and reduce reliance on the Federal government to do everything itself.	Another area under OPPTS has been Design for the Environment. This seems in effect a sales pitch for favored molecules in lieu of others that are disfavored for are unlikely to be scientifically plausible, if examined by competent independent scientists. Its crony capitalism and consorting with environmental groups, under the guise of being pro business. This thrived under Administrator Johnson and presumably under the last Administration. There are products in stores that purport to be EPA approved. The federal government should not be endorsing commercial products and meddling in the marketplace. If environmental groups want to do this, then they are free		
558	557	5/4/2017	We do need to upgrade our Lotus Notes-based systems to be cloud-based, such as FIAT - the international travel approval and tracking tool. FIAT is an extremely effective tool for tracking international travel and would benefit from being brought into the cloud.	Retain the professional and effective staff of the EPA that are well-trained and responsive to stakeholder needs and work hard in a resource-poor environment. Both the long-time staff and the newly hired staff are dedicated to the mission of EPA and to serving the public to protect the environment, while also addressing questions and concerns from stakeholders.	We need to provide scientifically agreed information on the EPA web site. The country and the world look to EPA to provide the latest information about many topics, including climate change.	No, I do not. I think EPA has reached a point, where it runs efficiently on very little and achieves incredibly effective results to protect human health and the enviornment with a high benefit to cost ratio (high monetary gain compared to cost of compliance). As a result, the American people enjoy some of the cleanest air, while residing in one of the world's leading economies. This is a goal many other countries seek to achieve, including China, Germany, Brazil and other economic powerhouses around the world.	A big missing piece that I see that would greatly improve the efficacy and efficiency of our projects is to have a Project Management Tool, which allows project managers to run timelines, budgets, projects, reports to manage large projects. I have not yet seen such a tool at EPA.	No comment at this point.

AMERICAN OVERSIGHT

	I
557	Thanks again!
558	As stated above, many agencies and corporations use project management software/tools to run projects efficiently and effectively. PCmag recommends these project management tools: http://www.pcmag.com/article2/0,2817,2380448,00.asp

559	558	5/4/2017	One organizational process that would help me do my job more effectively would be giving career staff more freedom in advertising our services and "products." The Food Recovery Challenge (FRC), one of the programs I participate in, is based in recruiting participants. It is difficult to meet recruitment goals without better media materials or use of the EPA logo to promote participating organizations. Businesses and institutions that participate in this program are happy with it and find it worthwhile. It would be easier reach agency goals if we could acknowledge the hard work of these organizations in a more public fashion. The public is generally positive about the work EPA does and we should make these efforts highly visible, especially when we help businesses make smart decisions that save them money (which is what the FRC does).	One way to support these programs is to support them more financially. I work on voluntary waste reduction programs and often it takes studies by states/local governments or private sector to prove the work will be beneficial financially and from an environmental perspective. In the past we have supported this work extensively and it has innumerable financial and social outcomes (e.g. employed the disadvantaged, begun businesses and non-profits, kicked off well liked local programs). States and private partners want to reduce waste to save money and help the environment but it takes some seed money that we can provide. Small businesses, institutions, and governments all benefit from these small investments.	I could provide better customer service if there were more FTE working on the same projects. I am already taking on multiple projects and communications with states/tribes/regulated community/ public with little time to dig deep and really assist them. Rather than cutting more positions, it would be beneficial to hire additional staff to assist with states needs and help them achieve their goals in a partnership.	Less fear of constant review by the new administration would help reduce cost and inefficiencies. I oversee small grants (less than 100k) for my program and with the indiscriminate review of grants and contracts earlier in the year made me delay my work, work that will go to fund small businesses and organizations. I am constantly filling out material to report where I will be when out in the public when I speak about what should be non-controversial issues. This also causes delays and ultimately inefficiencies in my work. When we need to pause our processes all time we waste our time and taxpayer money, which I believe is true as well when we review rules that have already been decided on. We are good stewards of	Better IT support.	My group is attempting to reengage with states by having increased contact on voluntary programs. We could accomplish more in the mutual interest in our agencies by having more staff to help increase outreach to our states and other federal agencies. Also, having more financial resources to produce studies used by the states would help us realign. States are able to better protect human health and the environment when they have scientific resources from our agency. If we cut programs like ORD we will have less of the resources states rely on to do their job.
560	559	5/4/2017	Currently all Administrative Orders that are issued are required to go through the Office of Regional Counsel. This was a result of the Supreme Court Decision in the Sackett case. Given that our Orders all contain language approved by the Office of Regional Counsel, that invite the permittee to come in and meet with EPA to discuss the Order and contain language consistent with the Sackett Decision, ORC review of Administrative Orders should not required in most instances. This procedure of mandatory ORC review of Administrative Orders should be ended.	In some instances there are some sectors of the regulated community that can use their political influence to lessen their regulatory burden at the expense of public health and the environment. Partnerships between state, tribes, local communities and EPA are extremely valuable tin addressing these sectors to ensure that environmental laws and regulations are being complied with, and are being applied uniformly to ensure a level playing field. EPA, States, Local Communities and Tribes need to assist one another and using the best and most efficient tools that each party can offer in ensuring the highest levels of compliance and protection for human health and the environment.	EPA has a good web site to allow for citizen's complaints and the ability to track them and EPA will follow up on these or work with State, local or tribal partners to address. This is a good system. Another area that currently works in some states is quarterly meetings to discuss significant non compliance within the State. Having this routine dialogue fosters a strong partnership where EPA and State partners can divvy up the work load and ensure the best and most efficient use of inspection and enforcement resources. It also ensures that non compliant facilities are addressed.	EPA's system to process Travel Authorization and Travel Vouchers is pretty costly - it costs about $18 to generate a Travel Authorization/Voucher with Airline Tickets. And even charges a few dollars for local Travel Authorizations. For example in getting reimbursed for an $8 fee at a parking garage may require paying an additional $4 or $5 to generate a local travel voucher to get paid that $8. EPA needs to find a lower cost system for Travel Authorizations and Travel Vouchers. EPA also needs to move most of its auto fleet to plug in electric hybrids like the Ford CMAX which is very fuel efficient - around 35 to 40 MPG. Plus it can go about 18 miles on battery power.	Increased use of real time monitoring of pollutants in streams and air can help target inspection, enforcement and grant resources to those areas where water quality or air quality is impaired. The increased use of real time monitoring will help to ensure compliance with ambient air quality and water quality standards	

AMERICAN OVERSIGHT

	I
559	
560	Inspection reports conducted by some state agencies are available for the public on line. EPA does not routinely post inspection reports on line, nor are Permits always available on line. EPA should work to make its inspection reports and Permits readily available on line for the public. This will improve efficiency and accountability, and also make it easier to work with our state and public partners.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
561	560	5/4/2017	EPA can, but does not do, cost accounting. As a result, programs stray from their original legal and statutory mandates and conduct "pet projects" of interest to some but not necessarily falling directly within EPA statutory mandate. Instituting cost accounting provides a means of being able to see where and how funding is being spent and who is spending - providing a level of accountability that EPA (OCFO and the program offices) has for years resisted.	More interaction from senior managers (AAs, RAs) on both sides to communicate and fully understand the dynamics of state, tribal and local issues. Senior managers tend to be reactive and micro-manage. Senior managers should delegate which would allow them the time to focus on the big picture and work with their counterpart executive - states/tribes/industry.	The question is interesting as it assumes the all listed entities fall in the same customer bucket. EPA is a regulatory institution that works with states/tribes/local to implement regulations mainly on the regulated community in order to protect and improve the environment for the public. As such there will always be level of dynamic tension between those who regulate and those that are regulated. That said, EPA (states/local/tribes) has a tremendously difficult time demonstrating to the public the benefits derived from environmental protection efforts. This is because EPA invests very little up front determining how the benefits of the program activities will be measured and communicated. This has been brought up over and over and EPA does nothing about it but provide lip service that environmental results are hard to measure. Just because it is hard, does not mean it does not	EPA needs to implement more business minded modeling into its culture. There is a culture of mission at all cost, which unfortunately, does not factor into fiscal reality. As mentioned in number 1, EPA can, but does not do, cost accounting. As a result many programs and projects stray from their original legal and statutory mandates and conduct "pet projects" of interest to some but not necessarily falling directly within EPA statutory mandate. Instituting cost accounting provides a means of being able to see where and how funding is being spent and who is spending - providing a level of accountability that EPA has for years resisted. This must be done, not at a high level,	EPA should take advantage and/or further it use of remote and drone technology for ongoing inspections, monitoring and enforcement. EPA should take a hard look at the various tools and methods that ORD has/is developing but no one is using -research for researchers - not for EPA program use. Work done in ORD should be directly, or more directly, tied to the needs of EPA program offices. All ORD work should be tied to a customer - program or regional office.	A relatively simple organizational factor that could provide cost efficiencies and clarity to EPA and those that do business with EPA, is to have consistency in organizational structure. EPA HQ is organized by major statutory program (Air, Water etc.) When you go to the regional offices, that implement the HQ programs, there is a hodge-podge of structures that few (even with the agency) understand. This is nonsense and ineffective - there should be clear lines of authority and responsibility, as well as accountability, directly from the HQ offices down through the regional offices. Are there differences in EPA
562	561	5/4/2017	The contracting regulations are onerous. There are many times when projects stop in their tracks for months at a time because a contract is being rebid. It's not clear why PeoplePlus requires separate lines for teleworking and in-office charges, and for different kinds of telework. Why does it matter where we worked on the project in question? And why does it matter whether the telework was regular or episodic? It increases the time it takes to do timesheets every pay period. The Concur system is overly complicated.		We already do intensive outreach to industry, states, and our other federal partners. We do a fair amount of outreach with the public. We should do much more with tribes. We have state liaisons but I'm not sure if we have tribal liaisons.	The IRIS process has become unnecessarily complicated by EPA's desire to let stakeholders weigh in multiple times at multiple steps of the process. The procedure has expanded to the point that we can barely get chemicals through the system. There should be one stakeholder input/review step at the beginning of the process and one at the end.		States should be held accountable for their voluntary cleanup programs. Often sites go into these programs and we can't touch them, but nothing happens on them for ages.
563	562	5/4/2017						
564	563	5/4/2017		We could certainly promote more environmental cleanup and economic redevelopment if we had more resources to travel to affected communities and more resources to convene stakeholders and strengthen partnerships in working toward common visions.	Again, the ability to travel to the communities we serve helps to assist and support them and provide the opportunities to interact and strengthen relationships and implement program objectives.			

AMERICAN OVERSIGHT

	I
561	EPA needs to implement more business minded modeling into its culture. There is a culture of mission at all cost, which unfortunately, does not factor into fiscal reality. (a.k.a. - Mission over Management) The points below (and mentioned above) are things that others are doing and do well. Cost accounting, workload analysis, organizational alignment and to some degree performance measurement. These are well established practices in the private sector. EPA should look to make management and accountability just as important as mission accomplishment.
562	
563	
564	Convening stakeholders and facilitating better collaboration in communities where EPA works to maximize resources where programs and partnerships can complement and support each other.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
565	564	5/4/2017	Immense amounts of weekly reporting that has to be done is not consistent, have been constantly changing as far as content and requirements of what to report and what not. I do account a lot of this increase in activity related to the transition occurring in the agency and realize that this transition period requires that type of weekly reporting of information. I recommend that one framework for reporting to upper management about activities be created or utilized for the entire agency (as there may already be an appropriate framework that part of the agency is using). The hiring process at this agency (and in general the federal government) is so prolonged that most of the time we lose most of the candidates that we want. Hiring shouldn't be that difficult. And now that we are assessing our budget requirements and not hiring as much previously, this could be a perfect time to refine the process and make it more efficient. As my experience of being	Joint partnerships, inspections, trainings and consistent contact with the states. Many EPA employees already do this and have particular contacts in their agencies that work together to efficiently get things done. These joint partnerships also include EPA partnering with other federal agencies. Many agencies (state especially) relay on EPA for funding, technical assistance, and sometimes even enforcement assistance. These functions are very important. EPA can continue to increase communication with their partners, invite states and tribes for environmental trainings, and continue to engage the communities that need us most. As many situations are different there can be numerous amounts of strategies that can be used to continue to protect the public health and the environment.	I really think that we could do a much better job of getting our mission and the different activities we do out to the public. We really are not proactive about that in my opinion, and we should be. Unfortunately, a lot of our communications do not reach the public that needs us most in a timely and effective manner. People don't want their health and environment negatively effected in their community, and EPA, states, tribes, and local communities, so why should it be so difficult for us to show them how we are protecting public health and the environment. Better customer service requires building a line of communication and relationships with these partners and the public. There are many effective ways that these relationships are being built on a daily basis in the agency, and those ways should be capitalized on.	We are the leading environmental agency in the world, and we should be setting an example by our internal practices. Right now I am not proud of the lack of sustainability initiatives we have internally, and the lack of support for those practices. Sustainability practices, like the environmental management systems (EMS) in place in HQ and the regions are important, save money, and assist us in promoting our mission of protecting human health and the environment. Sustainability is not hard and is just plain common sense. How can I promote our agency's mission and values when we don't even make these practices a standard part of our operations? This would and does reduce costs and protect the	Having more than one programmer for large parts of the agency will be beneficial. Why are we not investing in the technologies to make us more up-to-date? Continue to have trainings for these tools as they get introduced. How difficult is it to combine the People Plus timekeeping system with the different log in and log out technologies? That way I only have to enter my time in one spot and attest there. People Plus is not well liked in the agency, but a much needed system! Getting help to fix things in this system in HQ is difficult and I have not received an adequate response for help on a leave slip issue for over a year. Things like this waste my time, as my timekeepers have to keep up with these	Shared database systems with shared information across agencies. And make that consistent across the nation. Overall, there's a lot of activities that get accomplished and the different agency communications is positive. Some of these databases systems link together and work well, but not all of them.
566	565	5/4/2017	All conference rooms should have plug and play capability to allow staff to flow freely from their office to conference rooms and connect to the network and a digital screen for presentations and screen-sharing for in-office collaboration. Docking stations could be installed in every conference room that would allow your laptop to project on a digital screen installed on the wall of the conference room.	Utilize federal funding to fund more local, on the ground, environmental solutions in partnership with states and placed-based programs through targeted grants. The geographic programs and National Estuary Programs are a great example of what local engagement of a variety of stakeholders can achieve through creative and innovative solutions that involve a wide-range of interest groups (i.e. state and local governments, non-profits, and businesses). By being immersed in the community, these groups are able to engage with local stakeholders to evaluate the environmental issues, work with stakeholders to develop solutions, participate in the solution, and document the success!	Create web services that help states, tribes, and local communities better serve the public and get the word out on what work is being done in the field. We need more visual/video success stories that are professionally created and published that highlight some of the excellent work that results from EPA funds.	Break down the data silos and have all of EPA's data spatially related to the geography and located and managed in one place, then build web services that point to the data that relates to what people care about most.	Replace SharePoint with Google shared-workspace platforms. Google is way more flexible and not as clunky. There has got to be a more technologically advanced way of tracking weekly hot issues than the methods we are currently using... Peoples Plus will not allow us to pull back and modify leave requests. We have to request the approver to return the leave slip and then re-submit. This process needs to be optimized. EPA's work is spatial. Everyone should have training and access to GIS (GIS online). We should be able to share information and ideas utilizing today's technology.	Where it makes sense, take restrictions out of how grant funding is utilized (i.e. OMB guidance that requires implementation in lieu of program support) to give states more flexibility.

565	As stated previously, having things (databases, technologies, etc.) that are linked together are much better than having them separated. They are more useful. I do not know of any specific software that could be identified at this time, BUT I hope we continue to improve this part of the agency.
566	When I worked in the private sector, there was a program called Six Sigma, which linked professional development and performance to financial incentives. Staff are challenged to find opportunities for optimization, work to implement solutions, and if cost savings result, the staff receive a percentage of the savings. I'm not sure if that is a good fit for the federal government, but it created the incentive for continuous optimization and improvement.

567	566	5/4/2017	Our management started a travel help desk that is costing the agency way more money than the previous way of making travel arrangements. The travel desk staff make a lot of mistakes and we are paying the help desk staff salaries, the hours and salaries for whoever fixes their mistakes, the lost efficiency and work hours of the traveler because of the mistakes and delays of the travel help desk, and fees to the travel agency that have increased because the travel help desk makes so many errors. We also paid for a online travel system that is easy for employees to use but they blocked us from using it. This travel help desk is wasting taxpayer money and violates agency policy and needs to be stopped. Shared service centers for human resources should be disbanded and duties decentralized. The delays and mistakes in HR functions are costing us time and money. Plus these people don't know what scientists and engineers do but are making decisions on those positions and for organizations they	We need to make sure we have the funds to complete projects that benefit communities. Cleaning up waste, meeting with them to listen to their ideas, helping make towns in America better places to live.	Make sure we have enough staff to respond quickly to needs of state, communities, and others. If people call we need to be here to respond.	Focus resources on core programs and mission. Reduce non-core offices in regions, like administration and finance offices, and reassign staff to core program offices. Eliminate unnecessary GS14, 15, and SES positions in HQ and shared services.	Electronic concurrence	
568	567	5/4/2017	There are good reasons for why many things now require so much more paperwork.	EPA already does this extensively and it is highly effective. What is limiting is the resources available in terms of FTE, travel $, and funding and in-kind (lab, GIS support) available. All of those have been substantially reduced over the last at least ten years. Less resources means less performance, not just for us but in many cases, for our partners. Improvement may require restoration of a variety of grant programs, FTE levels, and the viability of in-kind support such as lab support that has fallen off in recent years. Active engagement in starting a new partnership is oftern a 0.5 FTE commitment to the project for 2-5 years with potentially some continuing activity after that. Grant funding from EPA is often instrumental in fostering effective partnerships AMOUNG among a variety of entities including federal, state, and local government entities, the	Improve navigation of the new website and create a functioning search engine for it. The best way to find something on EPA's website now, by anyone inside or outside of EPA, is to Google the topic separately. Otherwise we currently strive to provide the best customer service we can given the circumstances. Our ability to do so is expected to decrease. It is unavoidable that massive layoffs and budget cuts will result in a substantial decrease to customer service to everyone.	No	There is already a program and a schedule for this in terms of IT, and changes such as migration of IGMS to something other than Lotus Notes. Some of it is Federal Government-wide It would be helpful for the administration to research and understand what we do now, why we do it, and improvements already planned before instituting changes which may or may be improvements. Random changes without understanding the system is very likely to create rampant inefficiency, render existing systems less effective than they were, and result in poorer outcomes for which no one actually responsible is likely to be "held accountable".	State capacity to mange its programs varies from state to state. Very few could take on what are currently Federal responsibilities without some source of additional federal funding. Partnership, which we have now, is a better approach. Because no one can afford duplication of effort, programs look constantly for ways to better do business between the States and EPA. An example is the Grants Reporting and Tracking System which allows state Nonpoint Source Programs to upload their grant documents and data directly. EPA provides training and tech support, tracks progress

569	568	5/4/2017	I would like to be able to access work email from remote location more easily. I will not use home/personal email to communicate on work issues and it would be good to be able to more easily monitor emails in the evening or on weekends/vacations from personal devices.	I believe we already do a very good job of partnering with states, tribes, local communities and the private sector. I have always done that in my own case management and I encourage each of the attorneys who I supervise to do the same. We typically find that the states appreciate our efforts and are glad we are there to assist them. We often have more expertise, funding, FTE, or authority to bring to the table and they are most often very grateful. In most instances the states have asked us to take the action we are taking; in a few instances the states have failed to act and we are required to step in -- either as a matter of statutory responsibility or to protect public health and the environment.	We should continue to do what we are already doing. We should continue to have regular meetings, several times a year, so that we can tackle issues as they arise on ongoing basis. We have very strong relationships with our counterparts and we can always build on those relationships to make them even stronger.		it would be great to be able to access our work email on private devices while allowing the emails to be captured in the government server.	
570	569	5/4/2017	EPA has a number of bad computer management systems that must be used to conduct work. The IGMS system for grants management is not user friendly and just navigating the program is a major challenge. Most EPA users go into the system infrequently (one or two times per year) so a considerable amount of time is wasted to relearn this non-intuitive system. Reports for detailed post award monitoring are have formats that are awkward and are an embarrassment to send to grantees. Other systems such as gov trip are not easy to use and waste a lot of time. The Region 8 Quality Assurance Program utilizes a 10 page crosswalk for the review of any environmental monitoring plan that in practice focuses attention to trivial matters and away from the most important issues. A more streamlined approach would take less time and provide better results.	EPA should be an organization that can provide environmental expertise to help states, tribes, and local communities with environmental problems. EPA's expertise in programs that partner with outside organizations appears to be declining over the years. In order to be effective EPA must ensure that there is skilled expertise in science and engineering at all program levels, especially management levels. State environmental programs often require Professional Engineer or Professional Geologist registration for management positions, EPA should also.	Customer service must be made a priority, recognized, and rewarded. The EPA culture should discourage talking in acronyms and using acronyms in material written for the public, The EPA guidance for Brownfields Grants is not very user friendly in organization or in terminology. Review our documents for ease of use by the public.	EPA should determine areas where they can provide a value added benefit and eliminate work in areas where they cannot. At the regional level I have seen EPA trying to promote resource recovery or recycling where we have had the highest paid persons also the least knowledgeable and effective persons in the sector. EPA should reevaluate any involvement with areas such as sustainability, food recovery, job training, and resource recovery. With resource recovery, our emphasis should be to examine and work to provide a regulatory framework that does not prevent it.		Region 8 states have been running environmental programs for decades and have been running them well. EPA can significantly reduce the oversight. EPA being in an oversight role has reduced opportunities for cooperation and assistance.

575	574	5/4/2017	It would be most helpful for approved leave slips to automatically populate an employee time card in People Plus. It would also be helpful if only supervisors could edit a time card once it's approved -- locking it from employee access.	Model the Brownfields Program.	Consider sending IPAs from the Agency to states, tribes and local communities for two to four years.	While I appreciate the focus on outside stakeholders - states, tribes, local communities, private sector, etc., a focus should also be made on the Agency's infrastructure -- IT, property, facilities, budget -- perhaps establishing one AAship that merges OARM, OCFO, and OEI -- consolidating three AAships into one.		Use Brownfields as an example -- in its early years, prior to legislation, the Agency created a Brownfields National Partnership which included over 26 Departments/Agencies. The Council met quarterly and focused on doing things together - partnering - using and leveraging existing Agency/Department Resources to provide assistance for economic redevelopment in communities across the country. It started with 10 "Showcase Communities" where we featured the partnership efforts and shared the successes with other communities across the country..
576	575	5/4/2017	EPA has too many political appointees and specifically senate confirmed ones. Other similarly sized executive branch agencies (such as the US Forest Service) have none. We should consider filling spots with career professionals instead of political appointees to ensure continuity and with less disruption to workflow during presidential transitions. Also, the ADP process is a mess and has departed from its original intent -- there is no reason why for some projects you need to develop a workgroup that consists of random volunteers throughout the agency who have zero expertise on the topic. We need to consider abolishing the Office of Policy and ORD's Office of Science Policy -- they are redundant to the policy work in the programmatic offices.	There is little else that EPA can do. States, tribes and local communities, as well as the private sector, need to do more and they need the financing to do so. The public needs to push them to do more so that better environmental results becomes a higher priority for them to use their scant resources.	No ideas, we do so much already.	EPA has too many political appointees and specifically senate confirmed ones. Other similarly sized executive branch agencies (such as the US Forest Service) have none. We should consider filling spots with career professionals instead of political appointees to ensure continuity and with less disruption to workflow during presidential transitions. Also, the ADP process is a mess and has departed from its original intent -- there is no reason why for some projects you need to develop a workgroup that consists of random volunteers throughout the agency who have zero expertise on the topic. We need to consider abolishing the Office of Policy and	We need to get all systems off of lotus notes, eg. IGMS. We should have systems that function across one another instead of different ones with different pass words. For example to sign things in our various systems, there should be a common terminology. Right now, in some we "approve", others we "stamp", others we "review", others we "sign". Just have them all be the same!	No thoughts

AMERICAN OVERSIGHT

	I
575	The initial days of the Brownfields program, prior to legislation, are a perfect example of how the Federal Government can work together to provide assistance to communities -- I was part of creating that program for the Agency - I co-chaired the Brownfields National Partnership and the Showcase Communities Project, and would be very interested in participating/helping to launch a new Federal Partnership around an area or areas of Administrator Pruitt's priorities.
576	We should look to other agencies and see if IT and personnel systems could be replaced with better programs.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
577	576	5/4/2017	A customer service motivated organization should be created that aims to provide technical support of diverse kinds to meet the diverse needs of State and Tribes, at their request. This seems implicit in Back to Basics (about which I know little). Since the most important function of a federal EPA, it should be a significant organizational element within the Agency. Some existing offices within EPA could be shifted into this new entity, whereas individuals with usefully pertinent skills might be added too. For one possible illustration, the auto emissions testing office in Ann Arbor could be shifted within a new super office of assistance to States and Tribes. It could be removed from the Office of Air or from an enforcement affiliation, where-ever it is now affiliated, and instead simply serve to test automobiles, with results thereby available on the industry, available to any State or Tribe. Cost benefit economists might be added, in case they can assist States and Tribes to analyze options for	EPA could initiate a virtual network of employees who can offer diverse technical support for State or Tribe developed requirements for their industries. What could States and Tribes possibly need? Production engineering/industrial ecology familiarity. How do factories work and what kind of wastes and losses of materials arise? People with track-records for working constructively with U.S. industrial sectors Land or sediment cleanup remedial engineering. Air emission study expertise. Water treatment technology familiarity. Above all people who are client oriented and respectful. A customer service motivated organization could interview internal EPA applicants willing to			To support the Back to Basics program, I recommend sending out a survey to all EPA employees inviting them to nominate themselves for supporting the program. This would enable individuals to volunteer and to provide rationales as to why they are suited to serve such a program. If the question is posed instead to senior managers, for most their work careers have been spent as Federal regulators, so their sense of people to nominate may not be well informed? Not sure about this and am not claiming this, but it still seems a fair approach to ask all employees for nominations.	There needs to be a coordinative point of contact for each State and Tribe. This person can then consult the internal EPA network for possible opportunities to assist on a particular need in a particular State or Tribal land.
578	577	5/4/2017	Two of the biggest impediments to our operational effectiveness and efficiency are the lengthy recruitment and procurement processes. Our experience has been that within EPA these processes take much longer than EPA???s own service standards and, for recruitments actions, much longer than the metrics established by OPM. Simple procurement actions can take six to ten months, and contract extensions have become the norm because new contracts are not awarded in a timely fashion. Recruitment actions often take more than eight months. These cause delays in meeting our deliverables and contribute to poor morale. I would address these by applying the Agency???s Lean principles, focusing on eliminating unnecessary requirements beyond those necessitated by OPM and federal acquisition regulations. I would evaluate the internal EPA processes and systems, and benchmark with other federal agencies for opportunities to apply their best practices to our operations. Finally, given the	Continue to strengthen efforts in working with the Environmental Council of the States, Association of Public Health Laboratories, National Estuaries Programs, and other similar entities that represent the interests of states, tribes, and local communities. Similar efforts should be undertaken with the private sector and permitting EPA employees greater latitude in working with stakeholder groups such as the ILSI Health and Environmental Sciences Institute.	See answer to #2 re: Continue to strengthen efforts in working with the Environmental Council of the States, Association of Public Health Laboratories, National Estuaries Programs, and other similar entities that represent the interests of states, tribes, and local communities. Similar efforts should be undertaken with the private sector and permitting EPA employees greater latitude in working with stakeholder groups such as the ILSI Health and Environmental Sciences Institute.	Consider a thoughtful restructuring of Interior, Energy and Environment with a strong emphasis on research and development. This effort needs to more thoughtful and effective than what was undertaken in development of the Department of Homeland Security which continues to be a dysfunctional organization.	Continued development, deployment and use of sensors and the ability to develop an effective outreach and citizens science program.	See answer to #4 re: Consider a thoughtful restructuring of Interior, Energy and Environment with a strong emphasis on research and development. This effort needs to more thoughtful and effective than what was undertaken in development of the Department of Homeland Security which continues to be a dysfunctional organization.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
579	578	5/4/2017	Preparing travel authorizations and vouchers takes an inordinate amount of an individuals time. I've always fantasized about a travel system where I enter in some core information (dates of travel, destination, need for a rental car, etc.) and the system would debit my government credit card a total for the trip. I would then make my own airline, hotel, and rental car reservations at the government rate or lower and use my card to make the purchases. At the end of each year any unused funds would be credited back to the government. I've spoken to accounting folks about this and not sure this can be done with current regulations but wanted to share anyway.					
580	579	5/4/2017		Our state and tribal partners in Region 10 rarely implement the programs we delegated or authorized. Many past OIG audits identified states and tribes misusing funds appropriated to them by states. EPA then has a larger oversight role in those states because citizens call and complain about the state and local government not doing their jobs. I have been with EPA 13 years and consistently have seen issues with states not doing the required number of inspections and enforcement. There needs to be more accountability at the state level. EPA provides a significant amount of funding to the states and tribes, but there are rarely any consequences when the states don't follow through. Also, establishing task forces/committees that include representatives from state, federal and tribal jurisdictions to discuss the issues in each	As government employees, we routinely receive a significant amount of phone calls from states, tribes, industry, citizens, etc. I know several employees who have a hard time staying on top of work if they are having to spend 8 hours a day on the phone. It would be an improvement if there was a call center or administrative person that could take on some of these calls. One complaint I often hear is that many employees never return calls and this leads to bad customer service and poor government. Having at call center that could take care of this burden would improve our customer service.	EPA needs to do a better job of getting rid of poor performing or non-performing employees. Managers are afraid of conflict and are handing out "fully successful" ratings to employees who need to be put on PIP's or removed entirely. We need to allow management more autonomy to remove problem employees without the fear of being sued. Also, there is no accountability for employees who work from home.		
581	580	5/4/2017	Most HR processes are burdensome and the amount of time it took for me to get hired seemed unnecessary, it was over five months between my offer and when I was able to start.	We can do a better job the more we listen to local communities so I would like to see increased funding in our budget for EPA programs that deal with engagement with communities. We already have great partnerships with states and tribes.	None.	We are already operating at such low FTE and slashed budgets, I do not see how we can continue to maintain environmental protections for all Americans if we further reduce costs.	Improve Agency use of GIS, we seem to be behind other agencies and departments.	Not sure.

AMERICAN OVERSIGHT

	I
579	
580	I visited the Chicago GSA offices in 2015 and noticed that the entire office has moved to a full time flexiplace schedule which allowed for an office that looked more like an office of a startup. The GSA office had a modern open feel and docking stations so employees could come in and sit wherever they wanted. My understanding is that this model decreased office space and the operating costs of GSA-Chicago. For employees who do work from home, there should be requirements such as must be logged into Skype and must be responsive during core hours.
581	None.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
582	581	5/4/2017	Manually inputting leave that is taken into PeoplePlus each pay period can take a lot of time. I have worked at other agencies where once a supervisor approves a leave request, the leave is automatically entered into our schedule for the week and we do not have to manually enter it into the system and certify every two weeks. Streamlining the timekeeping system would reduce administrative burden.					
583	582	5/4/2017	I appreciate the tone you took in your invitation to offer feedback. This was really the first time that I felt as if anyone from the new leadership thought to ask about the view of its employees since the transition took place. I encourage you to do more of this type of thing since it helps to break down walls and build trust. To this question, I feel like the biggest problem with our bureaucracy right now is the apparent dim view that is taken of the Agency's core mission by the new leadership, the lack of concern about the welfare and opinions of the staff, and the outright hostility of the new management towards the scientific approach and data. People are afraid to engage with this leadership since it currently seems bent on getting rid of programs and getting rid of staff. This approach has been crushing for morale and has been a huge tax on efficiency. I think this ship can be righted but it will take effort and genuine interest on your part to show that you care about the	I would correct your question to add in environmental groups to your list of stakeholders to partner with. I think there are a host of issues, in water where I work, where we could use ADR approaches, such as mediation or regulatory negotiation techniques involving the key stakeholders (including the environmental groups as I mentioned) to better identify policy options where there is some common ground among groups with different perspectives. We do a good job of involving each of the key stakeholder interest groups during permit, rule, policy development, but we don't have a good way of involving them together in an efficient way. So we end up having splintered discussions with these groups. I think if these techniques were used it would give outsiders greater confidence that we were consulting with all interest	Transparency with these groups (and again the environmental community wasn't mentioned, but I would include them) always is the best way to go. There is great appreciation from outside groups when you were work with them openly and make them understand that you are taking in what they are saying and you are responding to their concerns.	Not at this point, but I know there are a lot of discussions going on about permit streamlining.	Overhaul of the conference rooms to allow for video conference calls. At a minimum, there is still an embarrassingly poor quality of AV in the office. Conference calls often have poor sound quality, and don't allow for people to hear others around the table. This gets in the way of us having good communication with stakeholders and among our different offices.	This doesn't really apply in our area of water permitting.

AMERICAN OVERSIGHT

	I
582	Increase mentoring programs, provide more funding for professional development and training, increase opportunities for details and temporary promotions, and provide more financial bonuses and incentives to reward and motivate higher-performing employees across the organization.
583	I mentioned previously making better use of ADR techniques such as mediated disputes and regulatory negotiation. These approaches seem to work well if you have the right people in the room and there is a clear policy goal.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
584	583	5/4/2017	Time-reporting in People Plus could be greatly improved. Approved absences do not auto-populate in the time card, I can't see my calculated hours until after I submit my card, I have to submit my time for several days that I haven't worked yet to get paid on time, and reporting account codes is an extremely rough estimate that doesn't provide meaningful data. We can sometimes be notified years later that there is a discrepancy between leave slips and the time card. All of this takes time and energy away from working toward the EPA mission. I would address these by both IT solutions and an examination of the time card approval process to bring it up to speed (it's all electronic but operates like a paper system).	There are certain aspects of my job that I am not an expert in (and I can't be an expert in everything), but that I am expected to make decisions about. For example, I work on pesticide labels and recommend specific label language, but as a scientist I have little training in how to convey directions so they are understandable to the general public. I also have little access to information about how pesticides are used by different groups. It would be helpful to be able to have an in-house expert, receive training, request systematic reviews, or fund research to answer those questions.			In the Office of Pesticide Programs, we do not currently have a relational database that makes all of the information on labels and associated studies searchable. Most of our data is still stored in pdfs, and in the cases where we do have metadata on products and studies, it is notoriously unreliable. This makes it very difficult to answer simple questions like "how many product are registered for use against x pest/on y surface?" There is an effort to create this database, but it will only function "day-forward" so it still will not address problems with legacy data. Poor data management reduces efficiency, increases stress, introduces preventable errors, and slows down customer service.	
585	584	5/4/2017	Currently, EPA and the States are prevented from spending CWA Section 319 (Nonpoint source pollution program) funds on restoration activities within MS4 areas due to the conflict with permit requirements. In regions in which a large percentage of NPS pollution comes from urban runoff, that restriction severely limits the restoration work that 319 funds can do. It would be helpful if that restriction could be relaxed.					
586	585	5/4/2017	Our continued use of Lotus Notes database applications is slowing us down and results in numerous redundancies. We should accelerate our move away from this outdated software.		We should reduce in-person travel to states, tribes, and local communities in favor of online and teleconference meeting options. This effort would save time, reduce costs, and limit pollution stemming from unnecessary travel.	We should reduce in-person travel in favor of online and teleconference meeting options. This effort would save time, reduce costs, and limit pollution stemming from unnecessary travel.

590	589	5/4/2017	The EPA has already cut back a lot from the time I arrived nearly 30 years ago. This said, I would suggest the following to increase the efficiency and effectiveness of the Agency: --Streamline the concurrence process. Too many people are currently required to concur on an action or document. I would propose eliminating at least one and sometimes two or three of the middle managers in the chain (I don't think some of them review the document anyway). Briefings are similar and I am sure there are other organizational processes that require an excessive level of concurrence before it can be approved. This occurs across the Agency, e.g. within the Regions, within HQ and between the Regions and HQ. One way to address this situation would be to give more authority to senior staff and to cut back on the details middle and lower management concerns itself with. --Examine the management bonus system. Right now, the bonus system seems to be based on the quantity of cases settled rater than more qualitative	Over the years, EPA has partnered with these groups, come up with very creative and workable ideas, then stopped the program from going forward. I would encourage folks to re-examine and re-start the ones that worked. I am most familiar with the projects involving Region 4 and the private sector, e.g Florida Citrus Industry (Air permitting), Tenneco Pipeline (TSCA penalty/CERCLA injunctive relief), Weyerhaeuser (Air permitting). In each case, the team streamlined regulations to eliminate overly burdensome and overlapping requirements. I apologize for not remembering the names of the programs, but I would bet somebody at EPA would. . . ECOS may have been the name of one; I think Tenneco started as a Region 4 initiative. Bringing back, re-examining, improving and/or broadening these innovative and streamlined	Although I have worked in the customer service area, it has been awhile. Thus, I will defer to others on this one.	Yes. Most of the people who work at EPA are incredibly creative when given the opportunity. I would encourage a re-examination, modification to work out the things that did not work, and implementing the innovative and streamlined projects, mentioned above, including self-disclosures. --In addition, I worked with the Underground Storage Tank Program years ago as it got started. My understanding is that its focus is still on the customer and helping the regulated community to come into compliance. I would encourage you to take a look at this Program to see whether some of the things they have done could be transferred to other programs. --Enforcement is so over-	I am not a technical person, but I would suggest that many regulations could be streamlined by EPA and industry (maybe states and tribes as well) to come up with more efficient, effective, accountable AND environmentally friendly.	Sometimes it is very good to interact with other federal agencies or states since the different perspectives lead to more innovative ideas. I would need to look at the programs you are referring to to answer this question more specifically, but it seems like it would be helpful to have fewer mandatory meetings and/or interactions between them.
591	590	5/4/2017	Staff is generally discouraged from participating with the professional communities associated with the industries we regulate. However, we greatly benefit from this participation, both to get our messages out, but more to learn from those at the cutting edge of their disciplines. As our research programs have withered, the information necessary to construct cost-effective regulations comes from external sources. It is to our detriment to not stay current.	We need to be physically present at meetings and collaborative activities with our partners. Networking with individuals is essential. We are in the unique position of being able to bring parties together and seeing the bigger picture when bringing different groups together. Those entities affected by our regulations often ask for such meeting as a way to get the administrating agencies to collectively agree on how to go from no to yes. This basically means additional funding to cover such travel, which needs to be in our customers' back yards, not our offices.	We need to be physically present at meetings and collaborative activities with our partners. Networking with individuals is essential. We are in the unique position of being able to bring parties together and seeing the bigger picture when bringing different groups together. This means additional funding for such travel. We also need to be able to talk with these groups openly, so that they can trust us to provide them useful information.		We would benefit from more attention to accurately assessing and monetizing benefits in developing and reevaluating regulations. We do an ok job on costs, but not so much on benefits. Our reluctance to embrace innovative means to comply with regulations could be improved. We could allow regulated entities to pilot innovative approaches and allow provisional compliance while they do so.

594	593	5/4/2017	Concur is a terrible travel system and our administrative procedures for travel authorizations, booking, and reimbursement is incredibly time consuming and burdensome, to the point where I have decided not to attend certain trainings because I would rather avoid Concur. Concur makes searching for flights incredibly difficult, when we really only have one option, the contract carrier rate, so why not just show those? I do not get any administrative support for navigating Concur, and since I use it so infrequently, I need to re-learn it each time -- I am very computer savvy, so this shouldn't be this hard, it's just the least intuitive system ever. We should have dedicated travel agents doing this work for us, or get an easier system to use that looks more like kayak or flights.google.com. Our timekeeping system, People Plus, is also antiquated and inefficient; I spend so much time logging hours in two different systems, and submitting leave requests is complicated and rife with	We need to increase EPA staff to improve our responsiveness and timeliness in responding to states, tribes, and local communities. States come to EPA with questions or things that need to be approved, such as state regulations under RCRA and Clean Air Act, and we cannot respond quickly enough. I worked on one request for approval that, by the time I received it, had been sitting at EPA for several years (6-7 or more) without any action because the work unit responsible for doing the review was not provided funding to do the review. Additionally, we need to increase EPA staff members' capacity to do the review of such submissions internally instead of contracting out that review, so that staff understands the full story if the state has questions, rather than the staff member doing a cursory review of the contractor's work and not being	We should increase training opportunities for states, tribes, communities, and the regulated community. EPA currently holds some training sessions for states, but these should be beefed up and provided frequently so that states et al. know what they should do and can have an easier time getting approvals from EPA. It would also help increase capacity and knowledge in EPA by holding these trainings, which would reduce review times. As for local communities and the public at large, EPA should reevaluate its approach to Federal Register notices of proposed actions, such as rulemaking. FR notices should be made more understandable to the public. For example, FR notices often list which industries are affected by a rule, but the general public has a harder time finding out whether any affected facilities are near them and how the rule affects their environment and	Although many petroleum exclusions are mandated by statute, EPA should remove them in regulations and policy to the extent possible and petition Congress to amend CERCLA to remove the petroleum exclusion from the definitions of hazardous substances, pollutants and contaminants. Petroleum products are often spilled in the same areas and we have to use a patchwork of authorities to clean up the full mess, or spend a lot of time ascertaining whether maybe the petroleum product is mixed with hazardous waste and thus subject to RCRA/CERCLA. It is incredibly inefficient. EPA should also ask Congress for more money to hire scientists. My region currently has only two	We need to modernize all HR and travel systems, as noted in Q1 - they're ridiculously inefficient and outdated. There are so many problems with video conferencing and presentation technologies that they are unreliable. I think we need to increase IT staff to troubleshoot these problems and stay on them (and the companies that provided the systems) until the problems are resolved.	EPA should demand that the Department of Defense and other federal potentially responsible parties (PRPs) reimburse EPA for our oversight costs at federal facilities managed by the federal PRP under CERCLA. Federal agency PRPs would be able to get a faster response from EPA if more resources were devoted to it, and it's no secret that DOD's budget dwarfs EPA's. DOD in particular could be funding tens of positions in EPA if it paid for our oversight costs like any private PRP is required to. We should use political channels to encourage PHMSA to improve its regulations to redraft
595	594	5/4/2017	Brownfields Program spends many mind numbing FTE hours to run a grants program- awhile the BF Legislation is open for amendment- please form a committee that can find a way to fund programs without having an annual disruption of dealing with grants process. Superfund site that are lagging progress should be forwarded to a "some review committee" that help move the site forward.	At the end of the Obama Administration the "Making a Visible Difference program" was a good attempt in achieve greater environmental good with collaborative effort among State, Tribes, Local communities, and at times private partners. This requires federal employees getting involved in the community to better understand the needs of the community. Too often we have employees staying in their offices and let the issues come to them. EPA employee should be more proactive and getting out the communities identifying the problems of the community. It is my experience in working in Brownfields Program to help underserved communities, the community leaders do not always know what EPA tools and other federal programs are available to help address broad range of community issues.	Please evaluate each program's reporting requirements and streamline it as possible. The federal grant programs have so much reporting requirements that the people who are performing the work are overwhelmed with paperwork. In the Brownfields program -- amend the grants program funding mechanism. Brownfields program waste many hours of just running the grant process. Form a committee explore ways streamline the grant process so the municipalities BF program is disrupted because of funding disruption due not getting a grant. For cities there is plenty of need that will take decades to tackle. Congress should provide a greater appropriation for Brownfields program- this should be "no brainer". I don't know a single program in EPA that better serves the State, Local Municipalities, Communities, and Private market	Find less cumbersome and fair way to fire employees that give the Agency a bad reputation. There are many very intelligent and dedicated employees in the Agency, but it only takes a few to taint the reputation of the Agency. We have good managers and supervisors and good and bad employees. Ask the employees if there are bad managers they would demote and at the same token ask managers if they have a list of trouble employees to demote lower or dismiss. It is like being in school, most of us knew who the bad apples were. We are suppose to serve the people, employee who do not want to travel because of all kinds of reasons should find another job that doesn't	I will leave this to tech experts. b	Past Administration started the MVD program- This requires senior leaders' and managements' buy-in and regional funding source managed by (Regional Administrator) in order to get work done where there is cross program needs instead of talking about it. Regional Administrator should have limited discretionary resources not tied to any programs so when there is a need the response could be quick.

599	598	5/4/2017				Reduce regulatory costs by increasing the applicability threshold under OLEM's SPCC program from 1320 gallons to 6000 gallons. Farms have this exemption since 2014, yet there has been no measurable increase in spills. There is no technical reason to treat farms differently from other facilities. If the regulation is overly burdensome for farms, it is likewise overly burdensome for other facilities. The issue has been studied in the context of farms. Not a single case has been identified where a farm with capacity less than 6000 gallons caused a reportable spill that would have been prevented by a prevention program such as secondary containment. To the extent prevention is effective, staff level		
600	599	5/4/2017	None.	(1) I am a CAA Inspector with years of first-hand experience working with state and local air pollution control authorities. I have found they are increasingly interested in participating in inspections where we apply advanced monitoring instruments to focus the inspections on excessively-emitting sources. My idea is to keep doing that; cases focused on actual emissions problems achieve the best results and provide first-hand experience for state and local inspectors. I believe that we could provide training to state and local authorities on how to conduct inspections where excessive emissions are the focus. (2) I have a number of contacts in the private sector (industry and consultants) with whom I share emerging issues; I believe that EPA Inspectors, who have real-world experience with multiple	See Q. 2.	Yes. (1) Having in the past been tapped to participate in reviewing grant proposals, I believe that EPA wastes a lot of money issuing grants that only result in papers, or other products that have only the slightest nexus to EPA's core mission. (2) There are boutique offices that were created during past administrations that live on, with no substantive benefit for EPA's core mission. They have good and talented people; perhaps they would like to back-fill as staff from core-mission offices retire or otherwise leave the Agency.	From a field presence standpoint, it has become quite clear that having the ability to detect excess pollution allows EPA to focus efforts on real pollution problems. This ability has transformed CAA inspections; I no longer focus on "regulatory scheme" violations that are of no environmental consequence. There are a few investments in instrumentation that could be made in certain areas of the country to advance this transformation. I suggest that someone contact OECA/OCE/AED management for the particulars; there is a lot of background.	See, Q. 2. (1).

AMERICAN OVERSIGHT

	I

601	600	5/4/2017	I work processing grant applications and the amount of paperwork required is vast. Maybe it is not practical to eliminate all of the forms and documents required but it seems counter to the EPA mission to print all of the docs for paper files vs. electronically file most of the grant docs. We are far too "paper" intensive.	Treat our partners more as true partners and customers.	Treat our partners more as true partners and customers. We're too inwardly focused vs. customer. Be more customer focused like private industry.	I realize the EPA mission supports telework but I see lots of wasted time by EPA employees using this program. Plus, our systems don't work as well in the telework environment as when employees are directly on the office network. Again, wasting valuable time and resources.	Electronically filling vs. paper files.	Better understand what the needs and drives of our customers are vs. what we want them to be.
602	601	5/4/2017	We should not be letting an individual sitting at HQ direct how innovation is incorporated into our work and how to better optimize the work we do. **[REDACTED B6]** has continually caused problems and puts roadblocks in the way of the Regional RPMs being able to optimize SF project implementation. In my opinion she needs more supervision and should not be given so much authority to interpret and direct policy decisions that prevent us from doing our work more effectively.					
603	602	5/4/2017	We track our time in two totally different systems: the Maxiflex system on Lotus Notes, and People Plus. These should be consolidated. In Superfund we bill to sites, but the billing system is complex, with thousands of possible codes. This could be simplified. The Concur travel system is difficult to use and takes more time than it should to complete TA's.			The EPA could use data science to help standardize data submissions from industry, so that data can be tagged and easily sorted. Currently, sorting through data is very time consuming. With the ability to tag and sort information on Superfund Sites, or other measures (pesticides, pollutants..), reviewing data and looking for trends in the data should be easier.

	A	B	C	D	E	F	G	H
604	603	5/4/2017	I am prevented from doing my job effectively when communications with the public are required to be approved by headquarters. The regions have the best on the ground knowledge and experience with how to communicate our work to the press and the public, and already have systems in place to allow for effective and accurate information sharing.	More funding should be requested and allocated to grant programs that assist states, tribes, and local communities in building up their capacity to enforce and administer environmental programs and laws. However, EPA oversight is also critical for ensuring that local and state programs are following the law and regulations and are not experiencing undue political influence from powerful local special interests. EPA is less susceptible to this pressure than state and local entities. In addition, more funding should be requested and allocated to programs that target environmental justice communities that bear a disproportionate burden of industrial pollution. In particular, targeted enforcement in environmental justice communities has proven effective in some states, by targeting areas	Transparent and open communication is key in improving our communication with stakeholders. Investments should be made in our community outreach and communications programs, and the new administration should emphasize the importance of providing swift and complete responses to FOIA requests. All stakeholders should be encouraged to provide comments to the agency on proposed actions and rules, and the agency should weigh these comments with a primary focus on our mission to protect human health and the environment. The agency should clearly communicate the basis for its actions, emphasizing the economic and health benefits of our regulations and actions. Economic benefits include not only market opportunities created by regulations that inspire and spur innovative new technology, but also the economic benefits of increased tourism, reduced damages to crops, and	Investment in effective enforcement, particularly in the Superfund program, can lead to reduced costs to the taxpayer and the agency. Enforcement allows the agency to recover costs from the parties legally responsible for the pollution and invest those cost savings into cleaning up the sites and putting them back into beneficial reuse. Effective regulatory enforcement also deters other in the industry from not complying with the regulations; increased compliance decreases costs associated with enforcement and accidents that require EPA and other agencies to respond and ensure public safety (not to mention the cost to the public from accidents and non-compliance that results in deaths, medical expenses,	EPA and the federal government continues to be behind the times on records management, especially electronic records management. There are too many separate systems that don't interact or are unable to interface with one another for different programs. It would be a very large project, but an effort to overhaul the records management system so that it uses the latest records management system that one would see in the private sector would be helpful. This is especially important as there are laws governing how government records are kept and provided to the public. The system should be user-friendly, easy to update as technology advances, and provide a way to index, catalogue, and organize	Joint enforcement programs can be powerful ways to combine resources of other federal and state agencies to target industries or areas where there are high levels of non-compliance. Another area of cooperation should be in scientific research; a lot of important ecological and public health research is conducted either by government scientists or through government funded programs and grants. State governments and non-governmental organizations rely on this research in guiding their decision-making as well. Partnering with academics, other federal
605	604	5/4/2017	The multiple layers of review take weeks/months/years to do research. Give more power to the mid-level managers.	Stakeholders like meetings, opportunity for public comment and having their concerns heard. Local communities want to be protected from companies/people that pollute. Tribes want to be protected from companies/people that pollute. States want the resources (money and talent) to be effective. How can a state hire a scientist to help them enforce the laws if they cannot afford to pay the scientist as much as a private company?	Hire more people. In 1976, EPA had 9,481 staff. The US census population was 218.04 mil. There was 1 staff for every 22,997 US citizens. In 1986, EPA had 12,892 staff. The US census population was 240.13 mil. There was 1 staff for every 18,626 US citizens. In 1996, EPA had 17,082 staff. The US census population was 269.39 mil. There was 1 staff for every 15,770 US citizens. In 2006, EPA had 17,355 staff. The US census population was 298.38 mil. There was 1 staff for every 17,192 US citizens. In 2016, EPA had 15,376 staff. The US census population was 323.15 mil. There was 1 staff for every 21,017 US citizens. The number of staff to citizen ratio is too high.	Better technology would save all people time.	Faster LAN, internet speeds, talk to text for the computers.	Remove the paperwork to work with other federal agencies and states. More collaboration could be possible if it was not so difficult. Agencies want agreements, they want to know how much resources, time and money you bring to the table. If you do not have many of those things, they do not want to work with you.

AMERICAN OVERSIGHT

	I
604	Large law firms may be able to provide information on e-discovery, records management, and record review that could be helpful in overhauling any records management systems in place at the agency. California has implemented an innovated targeted enforcement program in environmental justice communities (and I believe EPA has partnered with them in some cases on this program) that could be a model both for EPA enforcement in environmental justice communities and a model that could be adopted by other states. The Superfund program has some great examples of ways to optimize remedies that are already in place at Superfund sites to
605	Reward those who work hard and accomplish a lot.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
606	605	5/4/2017	I think the workforce is currently very distracted by the hostile messaging from the top. It's difficult to efficiently do your job while being bombarded by the top-down message of "I hate EPA" in the media.	I think that we should increase our enforcement presence in the states to achieve better environmental results. Too many times the sources have political sway at the state level, and our state partners are reluctant to take enforcement action that requires the installation of pollution controls. We at the federal level are somewhat more immune to political pressure from big sources (big emissions, but big employers) and are necessary to hold all parties bound to the requirements and regulations.	I think that as new rules are passed, we should have more face-to-face interaction with the state and local regulators, both at the time of issuance and at the implementation deadlines. This will give our state/local partners better understanding of the rules and provide better customer service to them. This will cause an increase in travel money, but provide a better educated and equipped state and local workforce.	The LEAN process (process improvement) is terribly inefficient. It utilizes a tremendous amount of resources in employee time and provides very little positive results. The Concur travel system and the Controlled Correspondence CMS systems are inefficient and unwieldy.	The CEDRI/CDX electronic reporting system is cumbersome to use - both at the regulator level and the regulated industry level. There must be a better electronic system out there that the facilities can use that is more user-friendly and intuitive for their required electronic reporting.	I'm not sure what this means.
607	606	5/4/2017	EPA's chain of command is rigid and top heavy and could benefit from a flatter hierarchical structure with cross-cutting teams that are more flexible and have greater decision-making power.	EPA could partner with the private sector on creating and promoting more environmentally-friendly brands, such as Energy Star. On another note, many state environmental protection agencies are in need of more manpower to complete their necessary compliance work. When states are experiencing budget and human resource shortfalls, the agency could assign federal staff to work out of these agencies to meet their requirements. This will help improve relationships between states and EPA, leading to greater cooperation.	EPA should strive to be as objective and apolitical as possible when interfacing with states, tribes, local communities, the regulated community, and the public at large. EPA's primary agenda should be fulfilling the agency's mission of protecting human health and the environment.	Some of our office layouts do not often reflect EPA values nor are they especially resource-efficient. Removing outdated cubicle setups and installing open office layouts and promoting hoteling and telework will cut down on agency costs, increase collaboration, and lower the workforce's carbon footprint.	Incorporating electronic signatures into forms using technology similar to DocuSign and have the capability of revising documents and sending them to users. Users will receive notifications in their email that a new document is awaiting their review and approval. This will cut down on our paper use as well as speed up the process of getting important documents signed and forwarded on to the right people.	

AMERICAN OVERSIGHT

	I
606	Our flexiplace and flexible time reporting systems are excellent. We have the opportunity to do work outside the traditional 9-5 hours at the office.
607	EPA could definitely adopt best practices and technology used by GSA in hiring and recruitment. For example, GSA has an online registration system for selectees to register for a time to get their fingerprints taken at their nearest GSA fingerprinting facility. Conversely, EPA has a number for you to call and the scheduling is done over the phone, if and only if the fingerprinting specialist happens to be available. Hiring should be seamless and user-friendly and not force the selectee to follow-up with their own hiring action. Implementing electronic forms with electronic signatures and giving HR specialists more sophisticated tracking systems will also expedite processing.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
608	607	5/4/2017	None - all encountered processes are working efficiently and effectively.	Continue with full program implementations and strategies in order to achieve long term goals and fulfill commitments.	Increase levels of funding and staff numbers across programs that have seen reductions or that are poorly staffed and funded in order to increase the extent to which involvement with states, tribes, local communities, the regulated community, and the public at large can be achieved.	Funding and staffing reductions in previous years have left no room for additional reductions. No inefficiencies are known.	Portable electronic devices such as tablets and smartphones enhance communication and allow for uses such as in-the-field mapping and up-to-date route planning. These technologies should be considered for all field staff.	Providing additional funding for travel and grants as well as increasing overall staff numbers would enable enhanced partnerships with other federal agencies and states. No areas of unnecessary overlap are evident, and increased joint work would be of great benefit in both the short and long term.
609	608	5/4/2017	Checking in with headquarters political appointees on every enforcement action leads to frustration of the enforcement team in the region as well as uncertainty and frustration for the outside party involved. The time delay while waiting for headquarters approval is also problematic for enforcement actions. I recommend relying on concurrence/consultation/notice procedures for regions to communicate with headquarters that were already in place for significant enforcement actions, and allowing regions to proceed on routine actions without such concurrence/consultation/notice, as was previously the procedure.	Allowing for open dialog between EPA program staff and state program staff would continue to help. Additionally, providing EPA regions with resources (staff and travel budgets) to meet with states, and continuing to provide states with grant money would foster good relationships and would support strong environmental results.	Asking a question about customer service is inaccurate. I work in public service. The government is not a for-profit entity with customers. We are a public agency dedicated to serving the public. I think an important element of providing strong public service is providing the public with full information on what EPA is doing and planning in local communities and across the country. Strengthening the public outreach and media elements of EPA would help tell the story of how public resources are being used for the public good.	I think less headquarters interference in normal regional processes would reduce costs and lead to better efficiency. I believe a lot of time and resources are wasted at both staff and managerial levels to prepare and provide briefings to headquarters. Headquarters needs to trust the regions to follow the guidance and procedures sent out from headquarters, rather than second-guess our work.	New technology should be applied to records management. EPA receives many requests for information through the Freedom of Information Act. To my knowledge, we do not currently have a strong system for searching electronic records. Having better technology would allow EPA to respond to requests more quickly and would provide for greater transparency as documents could be released quickly and EPA could have confidence that all appropriate records had been searched.	Cooperation.
610	609	5/4/2017	Believe it or not but we have a shortage of things like good pens and yellow highlighters, so more of each of these would be good. Just received a standup desk, which I am very appreciative of.	I think we already do a great job on this!	I think we are already doing this and have been for the almost twenty years I've worked here!	No.		States have been cut to the bone; I do not see duplication of efforts from where I sit.

AMERICAN OVERSIGHT

	I
608	High staffing numbers and incentives for long-term employment observed in many private sector businesses results in very high accountability with rapid response times. EPA should increase staffing levels to achieve this goal. Additionally, it is imperative that EPA provide as many incentives for staff retention as possible in order to enable agency expertise to maximize the efficiency and accountability that expertise provides. Promoting a culture of employee retention is one of the simplest way to maintain efficiency, accountability, and minimized cost.
609	No.
610	We meet regularly with our state, local and private partners; I'd recommend more of this.

613	612	5/4/2017	Inadequate travel funds prevents me from doing my job effectively. (I am allowed a total travel budget of $1,500 a year and need to travel out-of-state since the entities I regulate are located out of state.) On site communications and observations are critical for my technical and administrative understanding of the issues that would need to be addressed, as well as how best to work with the entities that I regulate. The way to address this issue is to provide more travel funds for mission critical activities. However, with the shrinking budget forecasted for EPA, it looks like even less travel funds would be allotted for me to do my job.	More effective, two-way communications. Even though outreach is generally conducted, EPA some times does not listen to what those outside the federal government are saying because decisions have already been made. Many of the decisions made by EPA are based on politics and not science. That was very obvious when I used to work in the private sector.	Be truly transparent. Be honest. Be truthful. Do not underestimate people outside EPA. I have worked with many people outside EPA that have great BS meters. They know that many of EPA's decisions are based on politics and not science. Even though the word "transparency" is used a lot throughout the agency, EPA really is not that transparent.	Headquarters comes up with the policies and the regulations. The Regions have to implement the policies and regulations. Many times, the policies and regulations are difficult to implement because they do not make sense, are inconsistent, are vague, or cost too much. To ease this, apply less political pressure on the policy/regulation-making, but yet keeping the completion of this activity within a reasonable timeframe. Also, listen to what the Regions have to say when asking for Regional response to a proposed policy or regulation.	I chuckle at this question because government agencies are usually one of the last entities that adopt new technologies and processes. Basically, after the private sector tries it out and decides whether it is useful or not, that is when the government agencies start looking at the technologies. Then it will take quite a while for the government agencies to procure and then adopt the "new" technology. If an EPA employee cannot be physically on site, then communication technologies are the next option. However, government agencies sometimes forget that in order for new communications technology to work, the person on the receiving side of the communications may also	I do not think that for some of the programs that realigning activities are needed. Some of the programs already work well with other federal agencies or states. By working well, I mean that our respective organizations complements each other. What one federal agency cannot do, another federal agency or state can fill in the gap. However, this cannot really be accomplished unless there is a good working relationship and communications amongst the organizations. Many times, however, it takes a long time to build the relationship and communications.
614	613	5/4/2017	The grant database tools (IGMS, for instance is sorely outdated and not user friendly) and amount of time it can take to award grants/cooperative agreements to partners could be much more efficient. Could more of this award process be simplified on the number of people that need to approve/touch the award all the way from competition advocate to Grants Management Office. Raising the dollar amount for awarding noncompetitive awards to proven entities that deliver results would be extremely helpful. It seems the entities who have been proven to deliver environmental results should have some easier process for funding projects to them (grants/cooperative agreements).	Using citizen advisory councils and business advisory councils have been helpful in the past for helping programs receive unique insight into how better to achieve results and target efforts with partners. Also, working hands-on with partners, because of close location to them creates some efficiencies with staff time, travel etc. in achieving results together as a partnership team. Of course, certain staff having excellent people skills and situational awareness may be best targeted for these efforts as well.	Having staff more closely located with these partners seems to help in some cases. In my personal experience in EPA, I have found it much easier to provide great customer service (of course, this is always the goal regardless of location) when I was located in a program and/or location where I was able to meet easily with partners. It also makes a big difference if you live an work close to your partners, because you see each other even outside of work (e.g. church, grocery store, little league). Close proximity, if possible, can help make stronger customer service and partnership bonds.

615	614	5/4/2017	Inconsistencies between Contracting Officers (CO). I work with several contracts each with a different CO. Every CO seems to have their own requirements for what???s needed for work assignments, task orders, funding requests, etc. It would be much more efficient if it was consistent between the COs. Why does it take one CO a week or two to process a work assignment/task order amendment and another takes closer to two months? Why does it take so long to get funds moved from one option period to another on a contract or to get expired funds deobligated? I???ve been trying to get some funds moved on an expired contract so I can pay the final invoices for over a year (closer to two). My requests have gone through my supervisor and her supervisor, but it???s still not done. If she???s that busy, why haven???t they evened out the work load? Don???t get me wrong, I know the COs are very busy, even overloaded, so why hasn???t the Agency done something to help? Like hire more COs instead of adding a	No comments	How about better customer service for EPA offices and scientists too? Not taking so long to issue a procurement request or amendment would help the scientists do their work.	EPA is too top heavy when it comes to high level management. For example, does ORD really need an Associate Assistant Administrator? Couldn't one of the Deputy Assistant Administrators fill in if necessary? That's just one example. It just seems like there are a lot of layers of high level management before you get down to the offices doing the science.	No comments	It would be great if other programs centralized their extramural management services under one office like ORD (see Q.7). One of the OARS/EMD goals is to share contracts across programs but it's difficult to find the right people to talk to. If the other programs had a centralized office to work with, we could possibly eliminate duplicate contracts across program lines and get more participation in sharing contracts.
616	615	5/4/2017	Current requirements to provide details about any routine program meetings that might include members of the public or staff from other agencies and to then await clearance to attend from D.C. is highly inefficient and ineffective.	Consistency in program implementation and adequate, dependable funding is critical.	Consistency in program implementation and adequate, dependable funding is critical.	Consistency in program implementation and adequate, dependable funding is critical.	There must be an adequate budget available to even begin to discuss this topic. ORD must be supported in order to efficiently and effectively incorporate new technologies.	Find a role for EPA in the Louisiana CWPRRA coastal restoration interagency Task Force that does not require field work, supported by scarce travel funding. For example, EPA could focus on water quality analyses rather than on project construction oversight, which could be handled more economically by agencies located in Louisiana.

AMERICAN OVERSIGHT

	I
615	ORD has centralized their extramural management services under one office OARS/EMD with very good results. It eliminates duplication of contracts for similar services in different offices, allows for multiple offices to use one contract, greatly reduces administration costs, and frees up scientists to concentrate on science instead of extramural management.

617	616	5/4/2017	Additional layers of headquarters review for relatively routine regional office matters have the regions less efficient at handling day-to-day work.			Increased teleworking could save agency resources. Where appropriate, well-performing employees could increase the number of days a week they telework, and then potentially consolidate office space. For example, two employees that each telework half-time could coordinate their schedules and share an office.		
618	617	5/4/2017		Disregard Scott Pruitt's and Donald Trump's directives to remove regulations that protect human health and the environment. Do not decrease EPA's funding and workforce. The agency has been reduced enough.	Disregard Scott Pruitt's and Donald Trump's directives to remove regulations that protect human health and the environment. Do not decrease EPA's funding and workforce. The agency has been reduced enough.			
619	618	5/4/2017	I work in air programs in an EPA regional office. Our office processes numerous state implementation plan submittals, as required by the Clean Air Act, from our states. These actions collectively protect and improve air quality. The new administration has added another layer of review for each notice before it can be published in the Federal Register. This has created an unnecessary bottleneck and inefficiencies affecting our work, and leading to wasted time. This extraordinary and unprecedented level of review would be understandable for controversial actions, but apparently every action is receiving the new level of review.	Discontinue the extra level of review of Federal Register actions accept for controversial actions. The current approach is not adding value. In fact, it is having the opposite effect.	Being able to act on state implementation plan submittals in a timely manner is how we can best serve the public. Again, discontinue the extra level of review of Federal Register actions accept for controversial actions. This allows the process to move at a faster pace and for EPA to better serve its stakeholders.	Same comments as above.

620	619	5/5/2017	Misalignment on prioritizing efforts and resources. For example, travel should be saved for efforts, whether business or project based, that require physical presence such as site visits, sampling activities or analysis, or first time collaborative meetings between state, local and tribal communities; but not for just meeting face to face. With current technology, we can train, discuss, communicate, present and even work on documents from other locations.	Organized collaboration, where the roles are clear, resources and responsibilities are defined. Create a memorandum of agreement that decides who will be leading based upon experience and funding; who will oversee quality assurance and controls and what approvals will be needed to confirm implementation and documentation of info	Liaisons exist between these groups but I am not clear on how this is done between each of the groups mentioned above. Therefore, if there is one person or perhaps different people whom can play this role and be involved in the conversations and planning when different stakeholders are involved in a plan, project or improvement project.	get rid of redundant/duplicative systems.	Electronic Research notebooks and project management tools that are interlinked to allow for documentation, saving of all types of documents and sharing within or outside the agency depending upon confidential controls.	Through collaboration and known resources, decide how and who can take on certain roles, share resources and implement certain aspects of projects or research. I believe some of the biggest problems are duplication of efforts or not a clear understanding on who will be responsible for certain aspects of the project and finally, what requirements such as quality assurance requirements will be followed. At this point in time, QA requirements vary throughout the agency and thus creates confusion between different offices, divisions and labs.
621	620	5/5/2017	At the EPA, there are experts in the laboratory. Their counsel could be used to avoid potential problems. Promote collaboration with the experts in the laboratory. (Overall, involve the laboratory in projects. Not just a resource, "an ally".)	"Helping hands" are thought of more fondly than a "bullying tongue". Solid expectations: I think our administrator, Mr. Pruitt, has the right idea; follow his lead.	Ask the simple questions: "What are your concerns?", "What do you want done?", "What would you require to accomplish what you want done?" Inform them of what facilities we have and the services we can provide them. Then, offer the services we can provide them. ["actively sale" the EPA services, (common business practice)]	Do not rely on contractors to do jobs we as the EPA are capable of doing. ("We are paying our people anyways, let them do the work.") However, in the event we do use other facilities other than "our own": Expand the concept of the National Lead Laboratory Accreditation Program (NLLAP). "EPA accreditation." This concept provides EPA as an "expert" organization. (This has a lot of potential; including monetary potential.)	Yes, there is much that could be changed to make things more efficient, effective, and us more accountable. Most of it is common sense; I am not going to spend the time explaining. (I apologize for this answer to the question not being helpful, but I did think it was important enough to indicate the existence of deficiency in efficiency, effectiveness, and accountability at the EPA.)	

AMERICAN OVERSIGHT

	I
620	Several but not sure if it applies to all agency needs. Some systems or programs at EPA are outdated and we could be more efficient if we begin to use modern/current applications to improve our jobs and reduce duplicative efforts. Also, telework opportunities for staff that do not require a laboratory should be implemented to reduce footprint, reduce utility cost, increase job performance (reduce traffic) and so forth.
621	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
622	621	5/5/2017	The budgetary planning process, while extremely necessary, has been the largest factor preventing my work's efficiency and effectiveness. Constant fear for the existence of my job has created large stress for me and prevented me from doing my best work. I would address the concerns of staff more openly and frankly - we understand that the president's priority is reducing the federal service and some jobs are going away, but real people and livelihoods are at stake. For example, it is extremely disheartening to see the president and the Administrator extol jobs in the coal sector while deriding EPA's work to prevent human health and environmental risks associated with coal. It would be nice if the administration showed some empathy for us.					
623	622	5/5/2017	The process for rule development and review has not changed to accommodate the frequently imposed court order deadlines to write new rules. Technical leads are given very little time to write a proposed rule or adequately respond to comments in a final package because of the lengthy and sequential review process by work groups, management, and various offices (e.g. OMB, OGC). The whole process should be updated to reflect the quicker timelines imposed by the court with an emphasis on getting the rule correct the first time around and not just putting something out to meet a deadline that we know will be reconsidered. Perhaps things could be reviewed by management or different offices concurrently with an offset of a week or two if one office really needs to have the last say. You should also consider decreasing the length of time each office is given to review, it often feels like it just sits on a desk anyway for most of the review cycle and then comments are done at the last minute.	EPA needs to pay attention to momentum in the private sector - big data providers - streaming regulatory data. Collection, storage, interpretation, and visualization of environmental data has historically been a role filled by the States and facilitated at a national level by EPA. A fundamental shift in these roles is occurring and is very disruptive in the environmental space. Big IT companies are tapping into open government data streams and building platforms that allow end users to combine regulatory data with non-regulatory measurements or other types of data (e.g. low cost sensors, satellites, health data sets from other organizations, etc). Outside organizations may use big data platform tools to characterize national or international air quality data in different ways. There will be pros and cons and a lot of questions generated that	None.	There is a general issue across government that workload is unbalanced. There are too many people that don't do much and quite frankly aren't capable of much and no way to do anything about it. Actual meaning for performance evaluations and consequences for bad performers would go a long way in retaining good talent and reducing staff/inefficiencies associated with keeping unnecessary people at the Agency.	Pay attention to air sensors (low cost, portable devices) measuring one or more pollutants. These devices will likely never be FEM/FRM quality, however, they will be deployed everywhere nationally and internationally and saturate the market (take a look at personal weather stations for example). EPA needs to help define data quality standards/protocols/application/use for these devices quickly before local, State, and Federal partners are bombarded with questions and concerns about certain readings. Big data (the internet of things, smart city infrastructure, the cloud, etc.) is really driving the ability to collect information with small, wireless devices and quickly couple that data with other data sets	E-Enterprise is a good model for States.

624	623	5/5/2017	Leave requests are not necessary for managing staff. Supervisors have daily communication with staff plus Outlook calendar tools for tracking/documenting/recalling staff whereabouts, making leave requests antiquated and redundant. The labor costs for the time spent by staff, supervisors, and administrative staff in dealing with leave requests through the time system could be eliminated by removing this feature from timekeeping. Contracting paperwork is a bottleneck. Uncertainty regarding contractor availability due to paperwork procedures (e.g., uncertain timing of contract rebids or task order approvals) and/or ongoing budget uncertainty makes it difficult for EPA project leaders to plan and execute projects, particularly if contract teams are forced into frequent stop-start unknown finding mode. Additional well-training contract project officers are needed to get things done, and turnover in this department needs to be minimized.	Partnering involves traveling to meet with and interact with partners. Sufficient funds typically are not available for travel. Partners are often interested in funding from EPA. If we want to develop partnerships we should to be willing to bring something to the table in addition to our expertise. Regarding the private sector, optics can be a concern.	The EPA does an excellent job of listening to stakeholders. We are funding-limited in the guidance we can provide and results we can deliver.	Inaction from Congress and political leadership is the root of much of the perceived inefficiency. For example, the CAA is 27 years old. All too often we get wrapped up in sue-and-settle situations or court-ordered deadlines leading to rule do-overs because the outdated CAA has rule review schedules that are too frequent, and limits our discretion (e.g., no de-minimis authority) and promotes the sue-and-settle approach. The original premise of the CAA has been interpreted by the courts repeatedly, each time chipping away at EPA's discretion to customize solutions for industry-specific or community-specific problems. Changing political leadership is also resulting in rule do-overs	More powerful computer equipment would improve staff efficiency for people working on complex projects involving large amounts of data. Staff should be given reasonable options depending on their project needs as computers are replaced. Supervisors for various programs could limit the range of options as necessary depending on program uses.	Continue cross-agency teams and develop new partnerships. However, such initiatives cannot happen if not funded.
625	624	5/5/2017	Ensure the budget process is implemented across the board...all offices within the Agency follow procedures to identify their top tiered projects...which are then shared up the management chain. These are then prioritized across the Agency. If you are relying on management to follow by example...then administration should lead by example.	Need to be very specific in defining programmatic elements/environmental results within partnership/cooperative agreements.	Need to engage with our partners and listen to their issues and concerns...can not create a one size fits all across our regions and states - what's an issue in Region 1 (and their states) will be completely different to Region 10 (and their states) and should be treated as such.	Previous administrations looked at creating "One EPA" across all programs. Need to continue this approach to remove redundancies but also to ensure that program offices are not duplicating efforts and/or resources.	Not aware of any at the moment.	Creating partnerships like the National Radon Action Plan or Asthma Disparities Workgroup that connect partners (federal, NGOs and industry) to develop action plans and strategies to implement change.

AMERICAN OVERSIGHT

	I
624	Consolidate "sick leave" and "annual leave" into one category of "personal time off" with an undesignated purpose. Because its use is not restricted for a given purposes staff could accumulate fewer days (e.g., 3-5 days less of what was formerly "sick leave"). Staff can use their leave as they see fit (an increase in flexibility for staff) and there is not longer any need for the government to track separate balances (an administrative cost savings). Reframe the hiring and retention process to speed it up allow supervisors more discretion. Allow an efficient mechanism for poor performers to be eliminated and replaced. If there is a RIF, supervisors should be allowed to

626	625	5/5/2017	We are generally limited to using Microsoft Internet Explorer (IE) on the computers in our office, but many web pages do not work with IE. I suggest that employees be allowed to choose to install one or more web browsers supported by EPA that allow them to work effectively. Chrome, for example is widely used in industry and academia. Another example is that only Microsoft Outlook may be used. In my opinion, the implementation of Outlook at EPA is very inefficient, and at times maddening. There are much better products available that allow employees to work more efficiently.	In my experience, our office works very well with states, local communities, tribes, and the private sector.	I think the EPA office that I work from provides very good customer service, which is much better than most other government agencies that I deal with. We need to continue to provide clear guidance in our rules, on our websites, and in the services we provide. Although it may not be feasible at this time, increased staff count in certain areas would help us provide improved customer support.	In my opinion there are too many restrictions on computer use. The EPA computer system must be secure, but sometimes poor decisions are made in setting us systems that cause inefficiency in our daily work. Also, the travel forms we have to fill out to get travel approved are confusing, time consuming, and don't address what is really important. We waste much too much time with these things. Someone that actually uses them should work with administration to streamline these.	Allow us to use efficient computer business tools. For example, Microsoft IE doesn't work with many websites. Let us use Chrome or other browsers. EPA's implementation of Outlook is frustrating and inefficient. Let us use Google Mail or similar. Give employees that run simulations on their computers administrator status. We can't even remove unnecessary icons on our desktop without support from EZTech.	I believe the work that our EPA office does is much better done on a national level than passed to states. A smart, effective national standard serves the industry that our office regulates much better than a patchwork of state rules.
627	626	5/5/2017			Improve the efficiency of our FOIA processing.		EPA should invest in Relativity Analytics, a tool which could dramatically reduce EPA costs in responding to FOIA and other document requests. Relativity Analytics identifies and groups "email threads" and "duplicate and near duplicate" documents. A similar tool (Equivio) saved EPA at least 24%, and could possibly have saved EPA as much as 50%, of the time needed to review documents for a large FOIA. These are saving above and beyond time saved by EPA's existing "de-duplication" software (iPro and EnCase). Such savings could be realized for the vast majority of FOIA and document requests, both small and large. EPA no longer has Equivio. Relativity Analytics is the potential replacement. It could save

628	627	5/5/2017	Opposite a private business whereby the owner of the business is responsible for the success of the business, leaders in the EPA are not beholden to investors and employees to turn a profit. Therefore, at the end of the year (calendar or fiscal), when everyone is taking their use or lose, there is no one around to sign off on administrative products. In a private business, the owner/president puts in the most hours to keep the business afloat. In EPA, the newest, most inexperienced staff are the ones putting in the most hours. I don't know how this can be addressed. The sign-off process to get anything through is ridiculous at times. It can add a few weeks, to several months to the process. Either eliminate some in the sign off chain or give supervisors time to do their jobs.	We already partner well with states and tribes and such. They respect us and we respect them and we seek help from each other when necessary.	We already provide great customer service (?) to states. We provide trainings, money, advice, leadership, technical help, when asked. Regulators need to stop criticizing the Federal EPA to the point that if a state wants to ask for help, they are made to feel like they are asking a bunch of circus clowns to help. Our state (and tribe, etc.) counterparts respect us and undermining that is not productive to anyone.	No. I believe that Obama's cuts were deep enough and have already made it hard for the EPA to fulfill our mission. More cuts would make it so that EPA employees are demoralized. We already work our butts off and are hampered at every turn. More of that would be detrimental to the country.	Of course there are. But EPA staff is already so overworked, that no one has the time or energy to implement new processes.	Stop worrying so much about the costs to corporations for environmental regulations. The public doesn't care if a corporation makes only $9 billion in profit vs. $10 billion. States need and want a strong federal agency when things go wrong and they don't have the money to fix it. That is what we are there for.
629	628	5/5/2017	Printing out routing slips to request signature from management. I would like to see if this can be done electronically instead.	Have more face to face engagement and interaction. Provide examples of success stories or case studies that can be used to inspire more work with these stakeholders.	Call people back and be available to answer questions from our stakeholders and the community. They are happy to hear from us and appreciate that we reach out to them.	Encourage management to appreciate staff more and develop better relationships with the people who report to them.	Yes - for grant work we should be moving away from printing emails, work plans and other grant related files. This is cumbersome, wastes a lot of time and is inefficient. Perhaps a database or on-line repository can be used instead. This would increase efficiency especially if an audit is ever done on the grant.	Learn what other agencies do and see how our work complements their work and how we can leverage our resources more effectively.

AMERICAN OVERSIGHT

	I
628	We have the best staff. We are dedicated beyond words. We believe in our mission and care about our country and world. We do more than just like statuses on Facebook or speak out at rallies. We live it. We choose to make our careers all about it. Those that are engineers or lawyers could make way more money practicing in the private sector, but choose to put their efforts onto something that will benefit the people of the U.S. We are intelligent, hard working, and dedicated. Many are scientists with analytical minds that always work with accountability and efficiency at the forefront. We are criticized and made to feel like our work is unappreciated at the highest levels these

630	629	5/5/2017	Answer provided from a private/public sector procurement/acquisition perspective. A: The field overall is old fashioned and the best practices are as such (i.e. duplication of contractual filing both paper and electronic; both manual and automated document routing procedures; partial implementation of system automation). Primary example, the public sectors procurement key/bible is the Federal Acquisition Regulations (FAR) http://farsite.hill.af.mil/ and it was designed as a one stop shop but each department and agency has subparts, that add additional layers of interpretation and applicability. The layers need to be peeled back and more standard regulatory requirements applied across all agencies/departments.	Answer provided from a private/public sector procurement/acquisition perspective. A: Leading by example with clear/transparent channels of communication from the top down. Defining the core of the agencies mission/requirement and the necessary partnership with each and every party/customer. The bottom line is about creating and communicating the bigger picture of how we all play a piece/part in the achieving environmental results. Also suggest greater private and public sector cross over and a more streamlined acquisition approach. Share and reapply experiences; as the two sectors are two very different worlds and many of the professionals in the field have minimal exposure to	Answer provided from a private/public sector procurement/acquisition perspective. A: Understanding your role from varying perspectives/sectors is key. The simple term buying sums up both private and public sectors use of procurement, acquisition, contracting, etc. and no matter how large or small, the general practice/function remains the same. It is the purchase of a product or service that requires logistical supply or delivery from one point to another, to satisfy an overall customer or user need. Understanding the service or supply we are providing is key to providing better customer service.	Answer provided from a private/public sector procurement/acquisition perspective. A: Better forecasting and planning practices for more efficient execution. The terms category/commodity management float around in both worlds and the bottom line is that there are existing specialties that make current practices overcomplicated, with too much oversight. Merge the overall customer requirement(s) administrative management together (i.e. EPA Contracting Officer Representatives are similar to private sector Program/Category/Quality managers) and automate processes (i.e. system flow through, such as contractual and financial interfacing and	Answer provided from a private/public sector procurement/acquisition perspective. A: Recommend investing in one standard commercial procurement system, with applicable regulatory requirement and contractual vehicle selection; creating borders for customization and interpretation (i.e. GSA has made tremendous advancement and is under-utilized).	A: Better understanding of roles and relationships with overall environmental execution; the downstream impact or flow-through of corporate/agency action.
631	630	5/5/2017	There are too many administrative reviews for regulatory packages - the administrative reviews take up to 3 months out of the regulatory schedule, which is usually 3 times more that rule writers actually get to write the regulations. I would cut some of the reviews out - 25 people reviewing the same package for grammar and commas is just wasteful.	We need to be able to do site visits to learn more about the private sector issues with our regulations. We need to be involved more with states when developing regulations, but when we reach out, no one is interested in working with us.			We need more electronic processes for collecting data and reviewing regulatory packages	If we could get states and EPA to use the same electronic reporting systems, we would be better able to share data and help the private sector by removing duplicate reporting requirements
632	631	5/5/2017	1) Too much annual training. Stagger training, make it good for multiple years, or require a certain amount of CEUs per year. Update training tracking systems for annual EPA training, CORs, grants POs, etc. 2) Institute further use of electronic signatures on documents. 3) Simplify Concur interface for travelers - make it more intuitive. Travelers are not accountants or finance experts; the terminology and requirements are extremely difficult to understand.	Open communication with partners.	Full access to and integration of databases containing environmental information.	Yes - build climate change considerations into all projects and programs. Build infrastructure that is more resilient to reduce costs for replacement after storms, floods, etc. Set water quality standards and establish TMDLs that take into account changes in water temperature, etc. that are occurring. Being proactive in all of our programs on climate issues will make it easier to achieve environmental standards into the future.	Electronic signatures.

633	632	5/5/2017	Legal Reviews: Legal reviews by EPA Attorney's (who are not prosecuting criminal investigations and nor are they appearing in court is a waste of time and money that can be spent on other important issues). U.S. Attorney's oversee or decline criminal investigations, not EPA Attorney's. This creates a conflict of interest when an EPA Attorney is telling agents what to write in reports and will not approve a legal review until their wording is placed in the report. These practices undermine the U.S. Attorney's authority and will eventually cost EPA when an agent testifies under oath that they are not the author of the report. EPA Attorney's spend countless hours on criminal cases that the U.S. Attorney's oversee, this time can be spent on agency issues rather than criminal matters being handled by the Department of Justice.	Suggestion: Ensure an EPA representative are placed in these various office as liaisons to support achieving better relationships and results.	Suggestion: Recommend evaluating customers needs on all levels to improve relationships with our customers and essentially the public at large. Our customers are made up of the public and serve those communities, so reaching out is key. Partnership and visibility on the local levels is important to understanding the concerns and issues at large.	Investigations Side: I do see untapped opportunities in investigations but many of the agenda's are forced by senior leadership who have outdated philosophies and tactics (particularly in the OIG). Within the cadre of agents there are untapped potential from agents who have been police officers, detectives, special agents in other federal agencies, and military investigators. These resources are invaluable, but these agents are leaving due to the stale methodologies of folks who did not perform criminal investigations but rather security or protective service functions as law enforcement. This inexperience has affected the agency and forced second criminal	Investigative Suggestions: There are technologies that could show leadership pie charts, statistics, open cases, closed cases, pending cases, types of cases, convictions, restitution amounts, and so much more; however, we have outdated technology because of the stale leadership philosophies or inexperience.	We can accomplish more by reducing the amount of work being duplicated. Mission and goals are key, followed by oversight and accountability.
634	633	5/5/2017				Eliminate political appointees since they come with no experience or pertinent skills, time is wasted getting them up to speed to that they can enact their political agenda, and they are undoubtedly paid more than those who have worked hard to protect the environment and the American people throughout their careers as scientists and the like.		

AMERICAN OVERSIGHT

	I
633	Yes. Currently, I am attempting to implement new practices considered by other agencies (as best practices) in areas such as evidence, ammunition accountability and purchases, training, policy reviews, and investigative processes; however, it is an uphill battle. These practices would save thousands of dollars, increase accountability, and improve efficiency all of the areas mentioned. For example, using training ammunition vs. duty ammunition for training purposes. Duty rounds cost .50 cents where training rounds cost .25 cents. If a person use 60 rounds to qualify with duty ammunition they are wasting $30.00 vs. $15.00;
634

	A	B	C	D	E	F	G	H
635	634	5/5/2017	Recently I have noticed that our communications, interactions, and work are subject to new rules and heightened scrutiny from EPA HQs. The level of scrutiny our work is receiving from leaders who would normally not be involved (i.e. senior management to HQ hierarchical review of documents) is inefficient. Each program and office has signatory delegations for a reason...so HQs does not have to be involved in every decision and can focus on their work. It takes much more time to go through review, concurrence, and get a letter signed...and time equals tax payer money.	We already achieve good results when we can partner with the states and communities and spend time with our stakeholders. Our budget over the years has already made it increasingly difficult to travel to state offices, meetings, conferences, etc. Dramatically decreasing the budget will only hurt our ability to achieve better environmental results by hampering our ability to travel out into the community or visit the state to foster that relationship and build trust. Phone calls and emails are not a good substitutes for face-to-face interaction, and a skeleton budget will make travel and that crucial interaction impossible.	One of the complaints I have heard from the states and tribes is EPA no longer has the staff to effectively carry out its responsibilities to the states and tribes, assist them with their programs, or travel to their offices to partner on projects or attend meetings. I have watched our budget be slashed dramatically through the years, and I have had to apologize to our states and tribes for not being able to spend the time and attention they need to effectively run their programs and carry out their responsibilities. Continuing to target EPA in the budget process, and decreasing the amount of grant money available to the states ands tribes will render federal, state, and tribal environmental programs completely ineffective.	EPA's budget has been slashed over the years to the point that EPA has a skeleton crew of administrative staff. That means we have scientists and engineers (GS 9-13) doing administrative work (e.g. finalizing, printing, and sending letters out). A scientist's hourly salary is was more than an admin's salary, and this is a huge waste of taxpayer money when a scientist has to do admin. work. They often don't have the skills or resources to do this admin work, and it takes a scientist much longer to complete these task. Additionally, this takes time away from completing their actual duties: maintaining environmental protection for all Americans. Another way to reduce costs	EPA has struggled though the years to figure out a way to go totally electronic due to lack of resources. Implement an electronic records system that stores past and current records for access by all of EPA. Get rid of requiring paper documents be submitted by the regulated community, and go to electronic signatures. This will eliminate the space and resources needed to store and access paper records.	Our activities are already aligned in areas of shared responsibility and mutual interest with the states and federal agencies. We are all driven by statute and regulation, and we work together to accomplish our responsibilities under these statutes. We also partner and assist our states in areas that are not regulatory driven (e.g. nonpoint source programs). The state wants to reduce pollution, prevent issues, and protect its citizens, and we help them accomplish this absent a statute. There are also areas the state does not have the resources or political will to undertake, and they rely on EPA to step up and do
636	635	5/5/2017	It does not prevent me from doing my job, but Environmental Justice issues raised by community memebers with a lack of good faith [where EPA is making every effort to protect the alleged EJ community] are given more attention by EPA than is appropriate. EJ concerns should not be a weapon for self-appointed community activists to make ridiculous claims for the need for EPA to give special treatment for the community in question - when EPA is already doing its job. EPA tends to be overly protective if anything. I flat out do not believe EPA employees would ignore health concerns just because a community was poor or of color. The EJ staff employees in my estimation probably spend very little time doing real EJ work because there are not that many new sites to be evaluated. The EJ staff probably spends most of their time doing nothing or creating busy work to create the appearance of useful activity.					Department of Defense agencies often take ridiculous positions. For example, DoD at one time asserted the position that an explosive is not a hazardous substance. Focusing on ways to resolve EPA-DoD disputes more quickly would be helpful. A dispute resolution should be mandatory on all DoD agencies. For example, not just the Army or Navy, but rather all DoD agencies.

	I
635	Electronic records management system - a lot of states, and private industry have gone electronic, and the federal governmental has lagged way far behind in this area. This will improve our efficiency by having information readily available for staff and our stakeholders, increase accountability and transparency, and reduce costs by not requiring floor space and buildings devoted to the storage of paper records.
636	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
637	636	5/5/2017	IGMS is the grants/IA database. Efforts have been ongoing to update it but they are very slow (years) and I personally haven't seen significant changes result from the efforts yet. I think changes have been recently made on the grants side but they are still in progress for the IAs. For example, in the IA decision memorandums, there are a number of redundant or unnecessary questions. Also, the programmatic baseline process needs to be revised. It is not clear who actually reviews those when regional staff submits them and what, if anything, is done with the information. The questions also need to be updated as some either aren't necessary or aren't effective.	Continue with implementing successful voluntary programs that EPA has such as Energy Star and Wastewise. These involve the private sector and are very appreciated. Perhaps they should even be expanded to the small business community if not done so already. Assist state/local communities with improving recycling rates by providing grants to better understand waste management/recycling infrastructure and to undertake studies. Also, EPA is needed to convene leaders and decision makers in recycling and other environmental arenas. EPA also can serve more of a role in providing guidance (not regulations) on standardizing approaches in recycling and other environmental arenas. Sustainability/sustainable development is also an area that EPA can focus on more and promote/support at a higher	There used to be a toll free hotline that EPA provided, however, I'm not sure if it still exists and if it does, it is not advertised enough since even I don't know if it exists as an EPA employee. EPA also needs to do a better job at marketing and improving communication about what role it plays and how it serves the public. The public at large is not very aware of EPA's voluntary programs, for example.	EPA used to make more of an effort to do compliance assistance as an alternative to enforcement, particularly with regard to the small business community. Not much of that is done anymore or at least it appears that way. This is an opportunity that will assist the regulated community in reducing costs and inefficiencies. Internally, EPA has begun promoting/implementing the LEAN concept to reduce costs and inefficiencies. This effort needs to be focused on more and promoted by management. It needs to become a part of doing business at EPA.	In the last few years, EPA has placed videoconferencing technology in it's office conference rooms. This technology does not get utilized much and it should since it cost $ to purchase/install. Instead of spending so much time and money on travel, videoconferencing should be promoted/supported more as it was intended to be.	Drinking water contamination has become a huge, prevalent issue. Most of the drinking water enforcement/monitoring falls to the states and they cannot keep up. USEPA needs to assist more with this shared responsibility/mutual interest. We do to some extent, however, it is not nearly enough.
638	637	5/5/2017		Fund states at levels that allow them to continue to run critical environmental programs. Many states do not have the budgets to completely take over programs that are currently funded by EPA. If state funding takes a big hit, then it is highly likely that states in each region will return programs back to EPA - this will effectively create more work for a diminished EPA staff.				

AMERICAN OVERSIGHT

	I
637	Program/project evaluation is a very useful effort and best practice that EPA attempted in the past but wasn't very successful at fully implementing. Management didn't support it enough so it faded. It needs to become a part of the EPA culture and fully embraced as I'm sure is the case in the private sector and other organizations. The CDC has an approach to program evaluation and implements it.
638

639	638	5/5/2017	The annual required online trainings are a huge waste of time. I really don't learn anything, and I try to just push through them as fast as possible. Some of them don't even apply to my job, that is extra frustrating!! The leave requesting module in PeoplePlus is way too complicated. The whole start day/end day menu does not make sense to most folks, and the system will not allow you to request 2 different types of leave on one day. It is unnecessarily complicated. Employees should be able to pull back requests as well when needed.	EPA should not maintain dive teams. The expenses associated with that are huge, and we could save a lot of money by contracting that work out when it is necessary. In our region the Dive Team has a dedicated vehicle, and the members participate in long and expensive training events. That doesn't make sense to me. We also have "operations offices" in each of our regional states. I think we need to be rethinking those. It makes sense to have an office in Anchorage, but I don't know how we justify offices in Olympia or Portland specifically.	I actually think we do this pretty well.	Yes. We have pushed so many administrative tasks onto the backs of our high graded staff because we've eliminated support staff. If we had an "assistant" type position in each work group, e.g. Budget Assistant, Environmental Protection Assistant, HR Assistant, etc., then we could increase the work efficiency and effectiveness of the higher graded staff. It is just plain silly for a GS-13 to spend time doing work that could be done by a GS-7 or 9.	Our IT tools aren't the best. Many employees still have heavy laptops that you can't really use for teleworking.	
640	639	5/5/2017		We need to be doing more community-driven and community-engaged research, answering questions that are relevant to the everyday lives of Americans with direct impact on communities. We could set up local EPA hubs across the country where researchers work directly with community members. Joining forces with citizen science would enhance EPA's accountability, relevance, and reputation.			We need larger, faster computers, servers actually. We are increasingly using large databases for our research, such as Medicare, and there is not enough space on our computers for this. Invest in technological infrastructure. Another big help would be to have tech support who are actually federal employees and who are adequately compensated. Our current tech support team (locally) is run down and inefficient because they are so overworked and undercompensated.	Share data resources and expertise with HHS. HHS (i.e., FDA) have large healthcare databases and other resources that we are replicating here at EPA. I've worked at both agencies and I find myself rebuilding the same systems over again, requiring hundreds of hours of work. This replication is time consuming and inefficient. We need to draw from the same well instead of building a whole separate well.

AMERICAN OVERSIGHT

	I
639	
640	Of interest might be FDA's Sentinel Initiative which provides real time or near real time signal detection in claims data. Pair this with environmental data and you have yourself a winning, innovative system.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
641	640	5/5/2017	Many of the administrative processes that I have to use as a supervisor at EPA are not user friendly. Because I have to routinely use them, I and other managers are constantly encountering situations where our time could be more efficiently and effectively used. Key examples are with travel software (Concur) and time keeping software (PeoplePlus). These are systems that are necessary but not user friendly. In People Plus, I would like the ability to aggregate time for a day and not see time per each accounting code. If I could do this, it would enable to get all information that I need to see to approve on one screen. Without it, I need to go back and forth multiple times between screens.	The underground storage tank program is a program that is implemented in large part by the states (except in Indian Country). The states rely on federal leaking underground storage tank (LUST) Trust fund money. The EPA provides this money via grants to the states. The states use the money largely to provide staffing to inspectors (prevention) and cleanup staff (cleanup). Cleanup money is more plentiful than prevention money yet the prevention program continues to absorb disproportionate amount of budget cuts. It would be better if the states could have the flexibility to combine their money (prevention and cleanup) and find the best way to ensure both programs work well and work together.	We already do a good job here. I don't have any ideas but I would be willing to hear what these customers suggested as areas for improvement.	I think we should seriously consider implementing all the Government Accountability Office (GAO) recommendations. They are experts at understanding how government works and they have great management and accounting skills. Every year since 2011 GAO has evaluated federal programs that overlap, are fragmented or are duplicative. It found dozens for the 2017 annual report. Rather than cutting needed programs like the massive reductions proposed by the President's 2018 budget which targeted Environmental Protection Agency, for a 31 percent reduction under we should focus on implementing GAO suggestions to make government more cost-	Not aware of any.	We already attempt to not overlap with states but some oversight of states is necessary. The only thing that I think we can do better is be more transparent about what we are doing and why we are doing it.
642	641	5/5/2017	Fear of losing my job, and watching politicians celebrate my potentially losing everything my family has...leads to the most inefficient days anyone could have at work. Give us certainty and job security and we will support your aims. We are here to work for the mission of the EPA, and support ANY current administration's understanding of it so long as it is moral, ethical, legal and constitutional. A little respect and job security will go a long way towards making you appear successful to the public. Give it a try.	Partnership building requires thoughtful training. Develop a comprehensive, sequential and cumulative training program for EPA to learn how to facilitate and be open to true partnerships.	My job is responsible for supporting dozens of good paying contractor jobs in rust-belt areas, using only American-made materials onsite. The work they accomplish remediates formerly toxic sites that can be redeveloped into new economic engines for these areas. Why do not advertise this? Why does the public not know we do this? It is insane that people only consider the EPA to be a regulation agency when so much of what we do is foster grants and contracts that lead to real trainings and jobs. We are already an economic-enhancing agency. Advertise those real successes.	Telework expansion will allow for less office space needs.	We have them already, it's just a matter of training and having internal processes change to utilize them.	Expanding telework is far more efficient than eliminating any region. The opportunities to work closely with the states and partners is then available for face-to-face because people live in that state or area.

AMERICAN OVERSIGHT

	I
641	I appreciate being asked this question. We should allow government agencies to benchmark other agencies. It is difficult to take any best practices from private industry and apply to the government sector. However, we can learn from sister agencies and perhaps from states and tribes.
642	Change employee performance evaluations to reflect a simpler way to discern high performers. Give only three choices: Unsuccessful, Fully Successful, and Exceptional. This way, we can measure the person that does 100% effectively, and anything else they bring to their position allows them to be recognized as "above and beyond." Right now, there are multiple areas above "fully successful" and no one truly knows what the difference between them. Also, add 360-evaluations instead of just relying on one supervisor to rate the person.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
643	642	5/5/2017		Respect treaties with tribes, such as the Standing Rock Sioux. Don't work against states which have established more stringent standards, such as the California fuel efficiency standards. Expand programs that support private sector innovation, such as Energy Star.	Provide adequate funding for efforts to streamline regulations. There are some areas where EPA and the regulated community are working together to simplify regulations and to remove obsolete provisions. Drastic funding cuts will hamper these efforts. The regulated community would benefit greatly from a more predictable regulatory environment. When each new administration radically shifts the policy focus, it destabilizes the economy and discourages investment. Many corporations have been holding back for years waiting to see where the shoe will fall on climate change.	Focus resources on reducing emissions of greenhouse gasses, which pose the greatest risk to the health, economic competitiveness and national security of Americans during the coming decades. (see http://www.sciencemag.org/news/2017/03/trump-s-defense-chief-cites-climate-change-national-security-challenge)	Continue to simplify and modernize reporting. There are many areas where reporting can be simplified, (especially if regulations are streamlined and obsolete provisions removed). EPA's reporting infrastructure needs to be upgraded to 21st century standards, migrating to web-based forms. However, drastic funding cuts will cripple these efforts.	
644	643	5/5/2017	The communications structure within ORD needs to be overhauled, streamlined, or at least DEFINED. There is a matrix within the matrix - we have ORD comms, national research program comms leads, comms staff working under the NPDs, and lab comms staff. And there's no definition or process for who is leading what. Lab comms staff are left reacting to the needs of all the other comms staff. This structure is inefficient and redundant. If all the levels will remain, at least define who leads what and what responsibility each level has. It's unclear and frustrating to try and work within this loose structure. It leads to inefficiencies in reviews, no consistency across EPA-produced comms products, and an inefficient, non-strategic approach to producing comms products altogether. We need to take a good hard look at comms teams and activities, and determine how to streamline development and review of products. We need to develop better definition of

645	644	5/5/2017	I think we are missing a crucial question in this survey: Describe any relatively minor legislative fixes (in environmental laws) which would enable significant efficiencies in the ongoing implementation of the national federal/state regulatory/environmental protection scheme? Oftentimes it is the underlying environmental legislation that causes enormous inefficiencies at both the EPA and state levels. A piece of legislation is typically well intentioned (and often bipartisan) but have well meaning bureaucrats spinning their wheels seemingly endlessly trying to implement some small aspect of the law (that was not well thought out). In all my years at the EPA I have never seen us be proactive with the hill in trying to get some minor legislative fixes. Instead we spin wheels trying to implement as is. I realize asking congress			I think we are missing a crucial question in this survey: Describe any relatively minor legislative fixes (in environmental laws) which would enable significant efficiencies in the ongoing implementation of the national federal/state regulatory/environmental protection scheme? Oftentimes it is the underlying environmental legislation that causes enormous inefficiencies at both the EPA and state levels. A piece of legislation is typically well intentioned (and often bipartisan) but have well meaning bureaucrats spinning their wheels seemingly endlessly trying to implement some small aspect of the law (that		
646	645	5/5/2017	Needing to wait on multiple levels of approval in precisely the correct order when filling out requests such as for training.	Better communication and transparency about process (not necessarily always data due to CBI concerns)	Again, better communication and transparency about both process and making them understand our perspective on regulation and assessment	Better coordinate regulatory policies, especially allowable limits and toxicological assessments, among various offices in order to improve internal consistency	Project management software	Better communication in order to find out where local governments or other agencies are deficient and where they have expertise so that we can fill in the gaps for each other.
647	646	5/5/2017	Publishing items in the Federal Register. Consider reducing the types of actions that need to be published (maybe only rules, and final decisions). Others could effectively be published on EPA's website, or in the docket. Simplify and streamline the task of hiring. The time it takes to bring on new staff is so long and difficult, it is hard to get the best people for the job.	Our public participation process is a very good way of getting input and by-in from our stakeholders. Allowing this process to continue would be beneficial. However, delays in being able to publish information on leads to distrust among stakeholders.	By sticking to the schedules EPA has established would help our stakeholders to better anticipate when our actions are being completed, and plan appropriately.	Reduce the information in FR rules, which would reduce the cost. Do away with any requirements for paper documentation and move to a completely electronic workflow. Improve IT systems to help manage the projects at OPP, and to help keep companies informed of the progress of their actions.	yes! SmartLabel would be a huge benefit to our program. All of the document processing functions should be reviewed for the Office, and standardized, to help find information quickly.

650	649	5/5/2017	I would say in general that EPA, in most instances, creates workgroups to develop a project or come up with recommendations and it takes FOREVER to get any actual work done. I would like to see quicker action and decision making across all aspects of the Agency. Also, our managers are in too many meetings and are not available to staff to assist with planning and direction of work. One problem I would like to see addressed is with poor performers (or just people who are unqualified for a job) who just get transferred around and become someone else's problem. As an example, I'll just say I'm in Region A and we hired a manager from Region B and the staff in Region B were so happy that manager was leaving. That manager, now in Region A, is not (based on what I know) qualified for the job he was hired for and I believe he creates problems for the group he manages as well as the entire Region which relies on services from his group. In addition to that, he brought an employee with him from Region B because that person was	my work at EPA does not involve partnering with orgs outside EPA so I don't have anything to share on this.	my work at EPA does not involve partnering with orgs outside EPA so I don't have anything to share on this.	I think most employees in the Regional offices wonder why there are so many employees in HQ. The Regions are doing the on-the-ground work.	I think all of EPA's electronic systems are poorly designed, not intuitive nor user friendly. A few examples include putting in a leave request and travel request. Also, EPA's IT support for existing technology is poor. When SharePoint became available, there was no assistance in how to use it and no vision for using it in a way that would improve our work. As a result, it has not been utilized to its full potential and many of our work sharing processes are stuck in the dark ages. Also, EPA does not have a corporate solution for Intranet. Regions are doing their own thing and struggling because we don't have the necessary tools or resources or tech support.	There is HUGE opportunity to make improvements in this area. As part of a special project, I identified something like 21 different environmental and health topics that other Federal agencies do work on, in addition to EPA.
651	650	5/5/2017	Redundancy in a lot of administrative tasks. Update and synchronize software programs across the Agency and between sister agencies. Implement admin policies consistently between Regions. Reduce administrative staff from doing tasks technical employees could do on their own and hire more technical employees to better balance workload.	Share information more, continue to develop and maintain productive working relationships with stakeholders, continue seeking stakeholder input. Invest in compliance assistance and voluntary programs.	Be transparent and stick to good science. Put protection of public health and the environment first. Keep up funding to support these communities and the public who benefit from the work our agency does.	Update the regulations. Most of our core legislation is very outdated and cumbersome to enforce and implement efficiently and to be truly protective.		We work closely with states well already. They are key partners in almost everything we do. Other federal agencies could share information better and cooperate more on common goals. Multi agency inspections, enforcements, collaboration on planning for shared goals etc.
652	651	5/5/2017				Bring IT work in house instead of contracting it out. There would be considerable savings for EPA and tax payers. EPA employees with IT back grounds would relish the chance to be more hands on and utilize and further develop their IT skills.		

AMERICAN OVERSIGHT

	I
650	I don't have any suggestions for this topic but just want to thank you for doing this survey in a manner that people can provide real, useful feedback. The Employee Viewpoint Survey doesn't provide comment fields so if they rate something poorly, EPA has no idea why it was rated poorly, or what the details of the problem are and therefore can't take any action to correct the problem.

PARTNERING 1-reach out to achieve better environmental results. 2-set a goal of reaching all states, all tribes in the US, all communities in the sates, and selected entities of the private sector.	PROVIDE BETTER CUSTOMER SERVICE 1-identify more and better ways to identify and measure customer service.	UNTAPPED OPPORTUNITIES 1-develop a routine that will keep managers and staffs up to date on new inventory and the value/cost of this new inventory.. consider	NEW TECHNOLOGIES 1-Inventory new technologies and compare them from agency to agency, and from state to state.	SHARED RESPONSIBILITY/MUTUAL INTEREST 1-try to identify and combine activities that are duplicated from agency to agency or from state to state.
654	653	5/5/2017	I do a fair amount of emergency response work with EPA Region 7's Superfund program. EPA needs the capability to address Superfund sites that do not score for listing on the NPL, so are not part of EPA's remedial process, but also do not qualify for a removal action - these sites typical involve contaminated groundwater (EPA will provide alternate water via the removal program, but not address the groundwater contamination itself unless the site is listed on the NPL). I think the new administration's goals regarding redevelopment and infrastructure would align with addressing groundwater contamination that falls through the cracks in the Superfund process.	I think EPA must simply continue fostering open dialogue, communication, and trust with states. In a recent discussion with one of our state partners in EPA Region 7, someone from the Nebraska Attorney General's office stated how important EPA was to the State of Nebraska - that the State always tried to work with its small businesses and municipalities, but that EPA served a very important role in having the political will, resources, and expertise to take enforcement cases against companies and municipalities who will not come into compliance. He was very appreciative of EPA's role and said that EPA often gets criticized for being "the hammer", but that "the hammer" was very important and necessary to the State.	I think EPA must simply continue fostering open dialogue, communication, and trust with states. I think this includes ensuring regular face to face meetings occur with our state partners. In a recent discussion with one of our state partners in EPA Region 7, someone from the Nebraska Attorney General's office stated how important EPA was to the State of Nebraska - that the State always tried to work with its small businesses and municipalities, but that EPA served a very important role in having the political will, resources, and expertise to take enforcement cases against companies and municipalities who will not come into compliance. He was very appreciative of EPA's role and said that EPA often gets criticized for being "the hammer", but that "the hammer" was very important and necessary to the State.	EPA desperately needs a better record keeping system. The Nebraska Department of Environmental Quality has a record keeping system that is organized by facility - that is, organized by address so one can see the progression of what business operated at the facility over the years, and it is all located in the same location in NDEQ's files. They have recently upgraded so that all non-privileged information is available online, to anyone. EPA needs a system like this! It would be great if additional resources could be used to facilitate an overhaul of our recordkeeping practices.	(Same comment as above) EPA desperately needs a better record keeping system. 656	655	5/5/2017	Dealing with requests such as this survey and "regulatory review" of this Administration interferes with us doing our jobs well. We need to deal with real environmental and public health issues, not fake ones created by people bent on the destruction of this agency and government as a whole.	Make sure that we maintain a strong presence in establishing good science, strong national standards, and enforcement actions. We need to help the states and communities prepare for climate change, as it will have a devastating effect on many states and communities. We need to bring real science to the table and identify what federal resources are available for them to tap into.	Establish strict national air quality and water quality standards. Tackle the lead crisis in communities. They can't do that alone, as it's too expensive. Having uniform standards means there will be no "race to the bottom" in which some states will develop very weak environmental standards or have to succumb to large, politically connected businesses. Communicate with states and communities that the states and towns with the strongest, most stringent environmental standards are also the ones with the economies that are growing the most high-paying jobs for their states and communities.	Simplify the hiring process for prospective employees with college or graduate degrees. While our agency has an incredible wealth of smart scientists and other professionals, we need more smart people on board to ensure we can maintain our protection of the American people as natural retirement and attrition occur.	Stop trying to do e-discovery on the cheap. Provide sufficient resources to allow EPA to respond to FOIAs and litigation. The more quickly and fully we respond, the fewer lawsuits we will need to respond to. But we need enough money committed to the e-discovery process to ensure that it is done well, thoroughly, and in a timely manner.	Other federal agencies and the states rely on EPA to bring well researched science, strong environmental standards, and an even playing field to the table when we work with states, communities, industry, and the public. We are well regarded for our excellence in all areas. It is difficult to see how realigning us would improve our effectiveness or efficiency. Up till now, we have been seen as apolitical, and it is vital that we continue to be non-political to ensure the confidence of the American people.

658	657	5/5/2017	The Action Development Process is inefficient and cumbersome. Most participants in EPA work groups seek to advance their individual perspective and do not try to balance competing objectives in establishing policy. Lead offices are forced to compromises to face substantial delays to elevate issues to senior levels to obtain a more balanced perspective.	States, tribes and local communities need technical and financial resources to carry out the actions necessary to protect public health and the environment we need to provide assistance as possible and /or to provide them with the tools and information they need to obtain the necessary resources.	Involving State partners and stakeholders in the development or review of policy and guidance prior to release can assure policies will be more readily implemented when final.	Research activities could be more directly focused on resolving programmatic data gaps and uncertainties.	Standardized electronic reporting and recordkeeping will greatly enhance the effectiveness of the Agency and our state partners in overseeing the critical programs to protect public health and the environment.	Better coordination of activities to more effectively address multi exposure route contaminants. There are some contaminants that are present in Food, Consumer Products, Air, Soil & Dust and Water. We could better work with our colleagues at FDA, CPSC and in the various media programs in EPA to better target where we can most effectively reduce exposure.
659	658	5/5/2017	Microsoft Outlook is an amazing program with so many features but my coworkers and I experience countless issues with it and it really creates a lot of delay. Even though it is the go-to platform for federal agencies it stymies my work and creates undue frustration. A more expedient service (or an overhaul to Outlook) would be appreciated.	The state and local community rely on resources provided by EPA, so taking those away does not necessarily help lower levels of government unless they are systematically redistributed. Keep up the grant programs.	Create a definitive jurisdictional directory showing which issues fall to which authority. I receive a lot of calls for issues that the state primarily deals with and I'm sure the public is frustrated by getting redirected constantly.			Provide more resources to overarching programs like Making a Visible Difference and Urban Waters. These are programs in which EPA directly partners with other federal agencies and levels of government, but it is hard to retain partners when capacity is limited and there is a constant question of whether projects that are initiated can be continued.
660	659	5/5/2017	Having HQ review each and every FR notice we sign. Not necessary if action is noncontroversial and supported by the state.			see answer to Q1.	broader use and acceptance of Sharepoint and OneDrive for document review and approval. Use of electronic submittal of all forms for FR publication.

661	660	5/5/2017	Within regulatory development jobs, the amount of paperwork and signatures needed for very minor rulemaking efforts (i.e., Tier 3, non-significant, direct final rulemakings that are essentially technical corrections and/or CFR housekeeping) is unnecessary. For instance, requiring the Administrator's signature to just update facility NAICS codes to OMB's updated NAICS codes (an exercise that happens every 5 years) requires jumping through many bureaucratic hoops. It would streamline processes that fall under the category of non-significant, no net burden, and Tier 3 rulemakings (again, these would primarily encompass regular updates of CFR text to note other agencies' updates) to only require the signatures of the respective office's Assistant Administrator.		Providing at least as many opportunities for disadvantaged communities (i.e., communities for whom the Office of Environmental Justice serves) to speak and present their concerns and suggestions, as are presented to industry. EPA should continually renew its commitment to protecting human health and the environment among those who most need assistance. Such venues could include webinars or town halls that are actively promoted on social media and press outlets. Additionally, encouraging (and perhaps setting aside budget dollars to do so) EPA staff to visit the areas their work affects (includes both communities and industry) would be greatly beneficial. Establishing and maintaining personal connections promotes better customer service, helps EPA staffers to understand the severity or complexity of issues surrounding different geographic regions or industries, and motivates	For reporting programs (e.g., Chemical Data Reporting), aligning their reporting software would be extremely beneficial to both EPA and the reporting community. While reporting requirements across different programs may not be able to change easily (there are many statutory requirements and bases for the regulations; submitted CBI/trade secrets also create challenges in aligning programs), streamlining the online reporting software to auto-fill in other relevant reporting programs whenever possible (which, again, may not be too frequently).		
662	661	5/5/2017	this answer doesn't directly answer the question, but in the last 8-10 years I think EPA has lost its focus. For example--why is EPA HQ spending resources and staff salary to develop what is essentially an "other" category on forms where one identifies gender (SOGI)? How is that related to environmental protection!? Why is E-P-A focusing on solely social issues. Some things have environmentally sounding titles, but don't actually do anything. My suggestion is to reduce or eliminate activities that are not related to EPA's mission--protecting human health and the environment. 2--I think all the of the restrictions that are currently in place about "external activities" are hamstringing the regular work of EPA. I realize that upper management @ HQ would want to know about press events or high profile public events, but having to report a technical meeting with a university or citizen is soo unwieldy. It's also very confusing about what upper mgmt. (I guess in HQ)	EPA used to have more voluntary compliance programs--what ever happened to those? EPA could make better use of CRADAs?--I can;;t remember what this stands for, but its some sort of public-private partnership agreement.	EPA should mirror customer service like those private companies known for outstanding customer service, Disney, Apple, etc. Disney has a leadership institute that teaches these principles. Send the Regular employees who do the work to training there--not managers/supervisors.	If regular employees had direct access to provide ideas, etc. to the highest levels. I think a lot of good ideas get tossed because they don't make it past a regular employees chain of command. When I worked at DOI they had a program called "Campfire" when Bruce Babbitt was Secretary. If an employee wrote "campfire" on their sealed letter, then it went directly to the Secretary and was opened by him directly. I did this to bring to the Sec. attention a situation that was occurring that was not consistent with our scientific practices. I heard later on that it got addressed AND I got a handwritten note back. I still have that note 20+ years later and I still remember the	greater use of tablets and smart phones, esp. for field activities. I don't know if IT can ever be more efficient because of all the firewall restrictions we have.	I think this is already been done successfully and to a great degree.

AMERICAN OVERSIGHT

663	662	5/5/2017	Getting contract task orders awarded has become incredibly arduous and, in some cases, impossible over the last 2 years. Contracting officers in OAM are constantly changing the rules and requirements for those of us who are CORs, even to the point of suggesting we write justifications in a way that is illegal because it would make their job easier. All this inconsistency has led to incredible delays of funding that threaten to leave money on the table and prevent us from implementing our programs.	State, local, and tribal communities depend on EPA to provide funding, technical assistance, and information-sharing to help them achieve better environmental results. At the federal level, we have expertise and a broader view than those who work on environmental issues at the state, local, or tribal level. For example, many cities and towns have only one employee who handles all public health and environmental issues. That employee is usually very busy and may not have time to research the best way to achieve water quality improvements. This is an example of where water quality experts from EPA can provide information about the best practices learned from communities across the nation that this employee (and thus, this community) would not have	Being able to communicate freely with states, tribes, local communities, and the public at large via the Agency's website and social media accounts is very important. Those are our main avenues to get information out to the public about the work the Agency does to fulfill our mission to protect human health and the environment. Customer service in this case depends on two things: who is the Agency's "customer" and what does that customer NEED (not want)? First, as with every other federal Agency, EPA's customer is the American public. Not a particular portion of that population, but the entire population. Second, EPA is charged with protecting human health and the environment, which is what the American public NEEDS (and usually wants). Some portions of our customers want economic protection or place other values above the Agency's mission,			
664	663	5/5/2017	We continue to be required to collect "EJ" information for the Case Conclusion Data System (CCDS) forms for our enforcement matters. I have never understood why this information was necessary or what anyone did with it. In contrast, it's helpful and necessary to know the quantifiable aspects of our work--e.g., how many tons of pollutants are cleaned up, how much of what the taxpayers spent has been recovered--the original purpose of this form in the pre-Lisa Jackson days. I also believe EPA's concurrence practice is unwieldy and time-consuming, and, with up to a dozen people on some concurrence chains and folks working flexiplace, the process takes way too long.	More communication with these parties is the best way of achieving better environmental results. I have always found that reaching out to and meeting with states, local communities, and the private sector is extremely productive. Our best assets are our people (scientists, engineers, experts), who typically want to cooperate with these other interested parties (and they with us) to help facilitate cleanups that benefit all. These "outside" parties invariably	To build on what I said in response to #2, the vast majority of these parties want a clean environment and want to do the right thing. Having a place at the table gives them a real sense that their views are being considered too.	We should have better management on the local office level, perhaps even desk audits of workers who are not hardworking or productive, but collecting a nice pay check. Reduce the size of EPA HQ. Most of the cleanup work and enforcement occurs in the Regions.	I recommend that the concurrence process I mentioned in response to #1 be done via email. EPA would save countless days throughout the year if this happened. Faster concurrence often means cleanups happen sooner.	To the extent it isn't already being done, we should be coordinating well with all the states in their delegated water, air, and RCRA programs. We should be cooperating fully with the states in coordinating any voluntary cleanups under their hazardous site cleanup statutes, so that there are no lingering and surprise federal issues that could get in the way of Brownfields redevelopment.

665	664	5/5/2017	Webforms needs to be replaced with something that works. We used to use PeoplePlus for 182s (training forms) but someone had a "bright idea" to use Webforms - an old antiquated system. Webforms doesn't work for a lot of the things we have to use it for, including PRs. We just can't get new updates anymore. FPPS/WTTS need to be replaced with a more modern program. This one is more archaic than Webforms. It still uses a DOS environment. I thought we got away from DOS a long time ago. All of our personnel-type programs and systems could use an overhaul.	Not my area of expertise.	Be nicer and stop speaking from both sides of our mouths.	Not my area of expertise.	Our existing processes need to be replaced with more modern processes/programs.	Not my area of expertise.
666	665	5/5/2017		Establishing clear expectations in writing among all collaborators at the onset of projects, including identifying the primary points of contacts and individuals responsible for the data collection efforts, clearly defining the types of information and data needed to support the decisions and conclusions that will be inferred from the information collected, involve subject matter experts during the planning stage to ensure the information and data that will be collected is comprehensive to support the decisions and conclusions, and ensure that the planning and information/ data collection effort is documented to defend decisions and conclusions.	Clearly define the expectations of each customer and involve the customer in defining the expectations, determine how the agency will meet those expectations, and evaluate if those expectations are being met through feedback from the customer.	Implement lean techniques at the department level, establish time baselines for current routine processes (from start to completion of each activity/task performed to complete the process, including administrative and technical processes), identify the activities/tasks with the greatest lead times, and evaluate if those activities/tasks can be streamlined be more efficient. Clearly identify constraints and perceived issues and address the constraints and issues.	Consider evaluating the existing internal processes for efficiency, effectiveness, and accountability, then determine whether or not a new process/layer needs to be added to the current process to achieve those objectives.	The agency needs to engage the other agencies and states to identify and better understand their needs to determine how the agency can support those needs and what actions should be taken to address those needs.
667	666	5/5/2017	The contracting, fiscal, and funding processes have many challenges. The delays are unacceptable. The decisions are inconsistent. The delays cause increased cost to the agency and disrupt the ability of programs to function efficiently and effectively.	Increase support for EPA's voluntary partnerships programs that work with states, tribes, local communities, or the private sector.		Improvements to our internal fiscal, contracting, and funding processes. The current delays and inconsistencies greatly increase costs to the agency.		

AMERICAN OVERSIGHT

	I
665	Not my area of expertise.
666	Lean is very effective in streamlining processes to help organizations be more efficient and effective, but needs to be executed and implemented from a big picture 50,000 ft perspective. Bringing in external lean experts to lead efforts should be considered, and the external lean experts will need full senior management support at all levels to be successful.
667	Performance-based metrics and accountability for internal administrative and fiscal functions.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
668	667	5/5/2017	Work to move the entire Agency to electronic concurrence/signature and filing systems. We are now using both paper and electronic methods to obtain concurrence and signatures on documents and in our records storage practices which is wasteful and environmentally unwise. Eliminate the recently established requirement for non-funded Purchase Requests to track and document contracting activities for which no funding is required. This is bureaucracy at its worst.	The Region 8 Superfund program has wonderful working relationships with our state partners. Many of our sites are conducted State Lead with EPA in a support role. We would love to see the new Administrator and his Deputy come out to the Region and meet personally with the various state leaders involved in the Superfund program to find out first hand how this works.	Increased focus on and use of Alternative Dispute Resolution and community involvement tools would be of great benefit to our local, state and tribal partners. The public would experience a greater level of engagement and support if this were to happen.	End the wasteful practice of sweeping funding at the end of each fiscal year. This long time practice forces federal agencies to spend funds in the last months of each fiscal year that might not otherwise be spent, which is wasteful. The ability to roll funds over from one year to another, with limitations of course, would be good for the government and good for taxpayers as well.	Our IT support is poor. We need to find a way to hire truly qualified individuals to provide IT leadership and support services to the Agency. Being able to use available technologies starts with having IT management and staff that are experts and fully capable of using these tools themselves before the Agency attempts rolling out or implementing the use of new technologies.	I don't honestly know.
669	668	5/5/2017	Production of formal audited financial reports for the FIFRA, PRIA and eManifest. Although required by statute these reports have effectively zero interest on the part of external or internal stakeholders. The reports are expensive to produce and are expensive to audit. A legislative change is required.	EPA should become a center of excellence for the entire government for producing cost recovery packages to support litigation. Justice Department attorneys involved with litigation consider EPA the Federal government's "gold standard" for producing cost recovery packages.	See 2.	Eliminate conference reporting requirements.	Modernize our cost recovery system (SCORPIOS) and make it available government wide.	see 7.

AMERICAN OVERSIGHT

	I
668	Move the entire Agency fully into the use of Lean process improvement tools and leadership techniques. Region 7 is the national leader in this area for EPA. Spending time in that region and learning how they have accomplished what they have in making theirs a true learning organization that understands, embraces and uses Lean practices every day of the week would be tremendously beneficial. Thank you for asking these questions and providing us an opportunity to share our thoughts and ideas with you.
669	Move financial operations to one of the four designated government wide financial shared service providers. EPA is too small to achieve needed economies of scale to run basic financial operations.

	A	B	C	D	E	F	G	H
670	669	5/5/2017	The following addresses People Plus: Leave is still not populating automatically as it's supposed to once approved. That needs to be fixed. People Plus does not allow one to withdraw or cancel a request for leave. That should be fixed. One cannot move one's CWS day in People Plus once approved. Instead, one needs to request an administrative assistant to do so. This is inefficient and should be addressed. Lastly, the Superfund site charging system in People Plus is antiquated and difficult to navigate and to add sites to one's "favorites." Also, one cannot add a Superfund site charging action code without requesting it be added by the administrators, which is very inefficient. That option should be a given for every site charging action code. The Superfund site charging system in People Plus should be fixed to make it easier to search for and add a Superfund site and its action codes to one's "favorites." With respect to enforcement-related decisions, there are too many layers of	With respect to enforcement, partner with states, tribes, local responders and the regulated community to offer workshops and training as a means to aid in response and compliance. Also, encourage states to partner as co-plaintiffs with EPA/DOJ during judicial civil penalty enforcement cases. Usually, such joint enforcement can lead to negotiated settlements that allows for not only the payment of civil penalties for state coffers but also supplemental environmental projects that benefit state and local communities, colleges and responders.	EPA needs more staff and resources to improve its ability to provide better customer service to states, tribes, local communities, the regulated community and the public at large. Years of spending cuts have jeopardized EPA's ability to perform its mission of protecting human health and welfare and the environment and providing better customer service to the public. EPA should post as much publicly releasable information as possible online, including validated sampling data, Administrative Orders on Consent and Consent Decrees, Unilateral Administrative Orders, Administrative Consent Agreements and Final Orders, RJO decisions, etc. This would cut down significantly on FOIA requests from the public and regulated community, thereby reducing agency resources and the time-intensive work from staff necessary to respond to FOIA requests. More importantly, it would	Please see my response to Question 3, above. With respect to judicial referrals, having a handful of attorneys specifically designated as Special Assistant U.S. Attorneys (SAUSA's) could help avoid the delay and downtime often experienced after a referral. This would also help especially with emergency referrals.	Superfund cost accounting needs modernizing to not only quickly determine past costs already incurred for a particular Superfund site but to also account for costs already paid. Often, a Superfund summary cost report of site past costs does not account for costs already reimbursed, thereby showing an inaccurate balance. Modernizing accounting software to address this would help provide more accurate cost reports and reduce wasted resources in having to search for reimbursed costs for a more corrected balance. There is a need to explore, perhaps in conjunction with DOJ, existing "legal/litigation hold" software that can be used to quickly and efficiently capture relevant	EPA has the experience and expertise in CWA/OPA civil penalty enforcement that the USCG may lack. Allow the USCG to continue as lead for cost recovery on taxpayer-funded oil spill responses while allowing the EPA to take over as lead for enforcement on civil penalties for all oil spills, both onshore and off-shore.
671	670	5/6/2017	Needs: 1) Electronic records database with OCR for all programs 2) Fully functioning databases for all programs that are utilized nationally amongst all similar programs 3) Automation of letter creation that includes all respective attachments 4) Regularly updated computers to minimize freezing up				See answer to question 1

672	671	5/7/2017	I am unable to produce good news stories or tweets from my office, because when they are submitted to the communications department higher up the chain, they die in a bottleneck somewhere. This has only been a problem since the transition. So perhaps ask the communications team how they did things before the transition and re-adopt some of those practices.	Money. Or miracles.	Perhaps not having an entire agency of dedicated public servants watch their work collect dust, die in other offices, be undone, and then be given a meager attempt at morale building through profiles of our colleagues would inspire us to provide better customer service.	The EPA has undergone budget cuts every year since I started working at the Agency. We have been working to find ways to be more efficient and save costs for years now. This question is like a track coach repeatedly dropping a cinderblock on your foot and then asking you how you think you could run faster. The Agency needs more money, not less, if it is going to be more efficient. Then it could tap contractor support to modernize or speed things up. At this point, the only thing that will come of continuing to press staff to find new ways to become more efficient and do more with less is worsening morale.	Since the existing technologies are already not being used to make the agency more accountable, there is no point in seeking out new ones. If the communications department would actually release tweets or press releases that showcased accomplishments, this question might be worthwhile.	Many of the administrator's authorities cannot be delegated to other agencies or states, so regardless of mutual interests, final responsibilities still lie with the Agency. The states rely on grants from EPA or from their tax bases to pay for environmental work. With less money to be distributed, they also are being asked to do more with less as well. Perhaps we should pray.
673	672	5/7/2017	Several years ago EPA migrated to a Shared Service Center (SSC) model for hiring and most other human resources functions. This model should be re-evaluated. Although it seems obvious that efficiencies and associated cost savings should have been achieved by consolidating this expertise, that has not been the result. Hiring is taking longer than ever and SSCs struggle to provide an acceptable level of service to the Regions they support. This SSC model also seems to fall apart when there are other organizations involved, in particular the Personnel Security Branch (PSB). It is not uncommon for actions to be stuck between our SSC and PSB for months. The Director who is responsible for our SSC is not held accountable for its poor performance. The concept of SSCs should be revisited. In addition, the hiring process would significantly benefit from a LEAN exercise, which would clearly identify roles, responsibilities and turnaround times so that SSC employees could be held accountable.	Our Region has excellent relationships with our state and tribal partners. We also expend a large amount of resources to work effectively with affected local communities and the regulated community. Everyone would benefit from better environmental results, and perhaps a cost savings, if we could expedite project schedules, but this is something that the regulated community is not always interested in or would support.		We have been a shrinking organization for many years and many efficiencies have already been put in place. Reducing our real estate footprint within the Regions would reduce costs. Some Regions have a physical presence in all of their states and that is not needed. Consolidating laboratories will also reduce costs. Consolidating libraries into a single library at HQ with virtual libraries in the Regions seems like an obvious cost savings.	EPA has many old software tools that are not just out of date, but archaic, such as WTTS, FPPS, Maxiflex, PP+, etc. EPA also has a bad habit of trying to design and develop its own software programs rather than purchasing proven systems from the private sector. I am sure these decisions were made because it was initially believed that building our own would be less expensive, but this calculation didn't take into account maintenance and the increased time it takes employees to navigate through systems that are not only slow but often do not communicate with other systems thereby requiring duplication of effort.	

AMERICAN OVERSIGHT

	I
672	Even if there were practices that could be considered best in class, I'm pretty sure that the current political opinion would be that the Agency is actually trying to ruin businesses and put people out of work, with no regard for new jobs or technologies that are being developed.
673

674	673	5/8/2017	1. EPA significantly reduced the contracts staff. This causes excessive delays in simple procurements. These delays adversely affect meeting the needed environmental outcomes. Increasing the micropurchase individual threshold and monthly threshold for purchase card holders will reduce the number of transactions that need to be processed by the contracts staff. 2.The requirement to create and process a TA for travel exceeding 50 miles is archaic. This should be at least doubled to 100 miles to reduce wasted staff time and processing costs. 3.Reinstate Level of Effort contracts to provide staff with the flexibility to adjust to uncertain outcomes within the defined scope. FFP and IDIQ are appropriate tools for situations where there is a reasonably high level of confidence in the outcome (e.g., purchasing goods) but not when the situation is uncertain (e.g., nearly all filed operations).					
675	674	5/8/2017	We are a very hierarchical organization. A flatter style of management would make us much more efficient.			Teleworking should be pushed. Doing so means less costs associated with renting office space. We have the capability through Skype, AdobeConnect and SharePoint to work remotely and still interact with coworkers and it reduces employee costs associated with coming into the office. Working remotely is also better for the environment: less air pollution.

676	675	5/8/2017				Require offices within EPA to but IT through OEI. If we have one central office buying all IT equipment, we can save a significant amount of money. We can also ensure everyone is compliant with all of the rules and regulations. When other offices buy IT hosting, etc...., they are not always compliant with all rules and regs.	Require offices within EPA to but IT through OEI. If we have one central office buying all IT equipment, we can save a significant amount of money. We can also ensure everyone is compliant with all of the rules and regulations. When other offices buy IT hosting, etc...., they are not always compliant with all rules and regs.	Work with other agencies on IT to make more central buys.
677	676	5/8/2017	High-level political appointees and managers who do not believe in core environmental science and laws prevent EPA employees from doing their jobs efficiently and effectively. The open hostility and subversive hostility that we have experienced since January is intimidating and bewildering, and inclines long-time EPA lawyers, scientists, and economists to not trust these appointees. It is wholly demoralizing to work for an Administrator who has made it his career goal to undermine and dismantle the EPA. From his interview at CPAC to his cherry-picked public appearances with white men at fossil fuel companies to his bizarre social media presence that ignores the actual environment, Administrator Pruitt stuns EPA staff daily with his out-of-touch approach to minimizing environmental protection and awareness and maximizing corporate cronyism. We cannot perform our jobs efficiently and effectively if our leadership touts an elementary and subversive ???Back2Basics??Â mantra	There is a glaring omission from this list: environmental groups. Environmental groups and concerned citizens have long been a bedrock stakeholder group for environmental progress, and it is shameful that this administration has thus far ignored their voices ??? obviously, by never mentioning them in the roll of stakeholders that this administration recognizes. Instead of viewing environmental groups and citizen groups as a threat, at least acknowledge that these groups are an important piece of the whole stakeholder picture. We can achieve better environmental results by trusting NGOs??? environmental monitoring data and by not wholesale dismissing highly qualified and objective scientists from the Board of Scientific Counselors. This administration has also never mentioned childrens??? health	Establish a credible and accurate social media presence that promotes protecting public health and the environment. Demonstrate that you value the work of women, people of color (conspicuously absent from this new staff thus far), and environmental professionals in general. Ensure that you also plan to provide better customer service to environmental justice communities, environmental advocates, and childrens??? health advocates. Stop having public appearances where the only photographs taken with the Administrator are with white males from the agricultural or fossil fuel extraction sectors.	Bring back the Greenspark Challenge, a highly popular and successful program. But more broadly, there is an untapped opportunity for the new administration to cease its hostility towards science, law, and staff so that EPA can function, as it has, as a steward for protecting public health and the environment.	Twitter, Facebook, and other social media platforms can be used very effectively, particularly in ways that do not constantly provide prima facie evidence that the new administration only promotes the interests of white males engaged in fossil fuel-based industries or industrial agriculture.	Putting aside that this is a bizarrely phrased survey question, it would help to see a more visible presence of new administration officials who value environmental justice, children's health, tribal environmental protection, and citizen participation. Thus far, it seems that the new administration would find it acceptable to decrease or eliminate such programs, and the agency has not paid any public attention to these issues since assuming office. That is incredibly troubling.

679	(1) Encourage and enable all EPA employees, as part of routine Agency responsibilities, to establish occasional but regular(a) "stretch" assignments and (b) full-time details in other Agency offices with priority missions to widen their professional experience, to improve morale, and to more broadly benefit the EPA from their expertise.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
680	679	5/8/2017	The main issue that our agency has is that low performing employees are not held accountable for their work. Managers rely on high performers to do all the work and don't address the problem. Managers should create a plan to help develop non performers potential and if they still don't want to work, then they have to leave the agency. Many managers within our agency don't take the time to learn what their employees responsibilities are. A lot of time is wasted explaining your duties to supervisors again and again.	Better communication is necessary on all parts. Communication with all partners should be open and shouldn't be limited to one employee. Stop redundant work.	EPA employees need to understand the mission of the EPA and the fact that they are public servants. Employees are treated individually and not as an organization, so most employees are looking out for their personal interest, not the EPA mission. Create a more inviting and friendly organization where employees can work together for a common goal.	Salaries are too high for many employees. The main focus of many EPA employees is how to get to the next GS, not the protection of the environment and human health. A lot of decisions, projects and Science advancements occur when people are motivated to get to the next GS, once there, the work stops. Some salaries are too high for the amount of work the employee has. Create a plan to control salaries and allow a more integrated work place where employees share responsibilities and work together. Offer bonuses to the high performing employees. Right now, all employees receive bonuses regardless of amount and importance of work performed.	Travel - most meetings are offered via web. Reduce travel cost by providing better ways for employees to participate locally.	Have regular meetings with partners to create a collaborative environment. Share ideas and distribute responsibilities accordingly.
681	680	5/8/2017				Consolidate office space and reduce operating expenses by further promoting telework.	We already have many of the technologies needed (e.g., SharePoint, One Drive, Skype for Business, One Note) that allow for seamless collaboration regardless of where a person is physically located. The Agency should focus on getting employees proficient in these existing technologies to enhance productivity.	

AMERICAN OVERSIGHT

	I
680	The main item that comes to mind is cross training. It has been my experience that managers are not opened to cross training their employees. When a person is unexpectedly out of the office for a long period of time, there is no way to continue the services as usual. Telling a customer, "You need to wait until my return" shouldn't be acceptable. Another reason for cross training is that some employees are always busy, while others hardly have anything to do. It would be more cost effective for employees with a low workload to help the ones that have many pending items.
681	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
682	681	5/8/2017	Using outdated databases and data collection systems and paying tech contractors to develop unique systems that require long-term sole source maintenance. These unique sole source technologies eventually lead to dead ends and enormous amount of money spent on maintenance. Use off the shelf systems that can be upgraded and maintained by any market company that is widely used by the American population to ensure we hire well-trained new staff who can use the technology.	Data systems should be able to communicate with each other across agencies. The worst thing we can do is develop a systems that doesn't communicate/share data across agencies. We still use and develop "unique" systems that don't allow communications between states, tribes and local communities. We need to ensure all data sharing is transparent and viewable by the public.	Some of our tribes are so far behind the technology curve ball. Provide additional resources that will help them improve their technology and infrastructure, similar to what we did for our state environmental agencies.	We hire new staff who do not have a basic understanding of office technology and continue to use paper versus OneNote or online storage systems. Every new hire should know how to use MS 365 office systems if they want to work at EPA. Mandatory training for all staff on system upgrades and the use of O365 systems. An educated and well-trained employee can save valuable staff time and dollars.	Update our superfund database. It's antiquated. It doesn't communicate effectively with states, tribes, or local agencies systems and very user "unfriendly" and doesn't like to share. Require all new data follow a strict data set standards. We have everyone and their mother adding things into the national superfund database without any strict standards. Thus we are unable to view the data in any format due to the massive errors.	
683	682	5/8/2017		EPA should not continue to invest in and maintain in-house boutique services that are infrequently used and can be provided more economically by private sector vendors. One example is the regional dive teams. Scuba diving is a highly specialized, high-risk service that the Agency should contract out to experienced, skilled professionals. The costs for training, equipment, vehicles (including boats and support vehicles), as well as the salary dollars and other expenses for training and travel, are too high to justify continuing to perform this service with in-house personnel. Some dive team members have claimed that scientific diving is their specialty, however many dive team members are not scientists or have no experience conducting field studies or scientific data collection.				
684	683	5/8/2017		View stakeholders not only as subjects of regulation but also as customers.	enhance description of processes and evaluation criteria	Increased documentation of work processes, evaluation criteria, ...etc. Enhanced intra-EPA coordination	There is no lack of ideas, but a there is a lack of resources to implement ideas. Consider a one-time increase in resources to implement ideas.

685	684	5/8/2017	There's too much administrative overhead on everything we do. Specific issues to address include: 1) Reduce the number of trainings we have to take, 2) Give us more IT privileges. Specifically, we (or certain trained users), should be able to modify sleep settings or install software (e.g. EPA software) on our computers without needing administrative privileges. We should be able to add EPA collaborators to shared folders without needing multiple approvals. 3) In general, reduce paperwork / number of signatures from different people required to do anything	In the Office of Research and Development (ORD), we should have a strong communication channel so that these groups know how to leverage our capabilities. We have a lot of skills and resources in our workforce, but finding out how to work with us is very word-of-mouth. Internally, we do not even have a directory of researchers so that I could, for example, find someone with a particular skill set to help with a project. I can only ask around.	-	We need to hire more young people with the right skills for the current tasks. This would address many problems related to costs and inefficiencies.	There's a different system for everything - PeoplePlus, Employee Express, Webforms, SharePoint, Concur. It's hard to find out how to do anything from our intranet pages, I end up having to ask someone almost always. Our online info should be up-to-date, and admin systems streamlined or procedure eliminated.	-
686	685	5/8/2017	Multiple layers of management before reaching a decision maker severely hinders the time in which CERCLA decisions are made. I'm an attorney with a second law degree. But in order to reach a decision maker I have to brief up to my branch chief, then brief my division director, then office director level (and all of their deputies) before getting scheduled to brief the AA. This is a process that can take two months or more. Flattening the enforcement office management structure so that no attorney has to brief up more than once to someone who can make a decision is urgently needed for efficiency but also staff morale. If delegations of authority need to be revisited to delegate decision making further down, do it. Eliminate the position of Regional Liaison. These attorney positions are essentially secretarial in nature and could be done by a trained paralegal to provide intake and referral to subject matter experts. Liaisons used to have funding to participate in case	Elevating political blocks sooner. Technical challenges are one thing, but when political differences prevent agreement on long term solutions, particularly in CERCLA, these issues need to be raised to political leadership, both at the agency and on the Hill sooner. Most importantly, tribal governments need to be given the same treatment as states in terms of authority and grants. Tribal sovereignty needs to recognized and respected by political and career leadership.	Remove poor performing managers. I once witnessed management set up a facilitated discussion for staff after a poor EVS showing. The managers walked in as the conversation with the facilitator was about to begin, completely undermining the safe environment for feedback the managers were "attempting" to create. One very simple idea to improve customer service is a tracking system that many retail sales outlets use. I work at a big box home improvement retailer on weekends (because of shitty government pay for attorneys). I have a weekly timer on my customer contacts with green, yellow and red indicating what needs to be followed up on. Inquiries from the public, from our regional clients, etc. could be inputted in a similar manner with requisite employee targets for responses. That way management has a tracking ability for workproduct/customer service and	Flatten management and delegate authority lower to empower professional staff. I had more autonomy and authority on the Hill as a 23 year old Legislative Assistant than I do with two law degrees and 9 years of agency experience. I continually look to return to the Hill because my talents are wasted in a bureaucracy where I have to run everything through branch chief, deputy division director, division director, deputy officer director, office director, and AA. Decisions that could be made in hours take weeks or months. And they don't percolate to headquarters until they've been elevated through the same type of management chain at the regional level. Empower professional staff.	Create a Technology Implementation Administration. EPA shouldn't be bidding out an upgrade/update to it's constituent management service. That's a technology that could be shared across multiple agencies under a single contract. Quit leasing computers. Purchasing computers is cheaper. Attorneys in enforcement don't have smart phones. Empower attorneys to record their time as they actually spend it. I was checking email last week while on Annual Leave in order to monitor several items. I did this routinely while serving in the Administrator's Office. My	Eliminate OSRE and move the enforcement attorneys into regional enforcement roles. Enforcement attorneys in headquarters cannot make good policy without having been in a primary enforcement role in the regional offices first. We simply do not have the experience nor the delegated authority to make enforcement policy. Either change the delegations to give us that authority and work experience or eliminate the positions/offices.

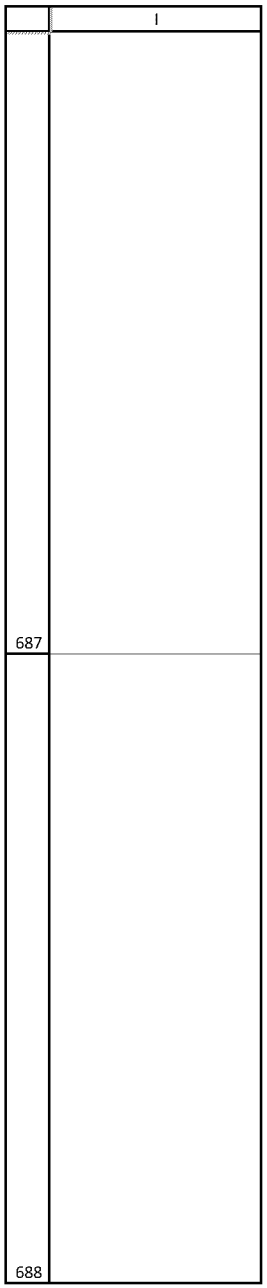
AMERICAN OVERSIGHT

	I
685	The software we use for research should be open source / open access unless there is no option for the application.
686	None. My office is a bureaucratic nightmare with no accountability for poor managers. The regional offices avoid coming to us because we are seen as an obstacle to settlement. I've had regional offices actively avoid filing general or special notice letters in order to avoid triggering policies that would require them to report on negotiations status to us. The region simply conducted the negotiations without filing notice until an agreement had been reached. OSRE is dysfunctional, beset by poor morale and needs top to bottom reform.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
687	686	5/8/2017			Station more EPA employees within State offices. It can be very effective in serving States better because 1. the EPA employee becomes much more intimately familiar with State regulations and policies, and 2. the State has an on-Site go-to person to answer questions about EPA regulation and policy and to relay concerns back to EPA.	Adopt a groundwater cleanup policy that allowed deletion of National Priorities List sites when groundwater that exceeds drinking water standards is located only on on-Site property and is naturally attenuating. Adopt a groundwater cleanup policy that differentiates between aquifers that are currently used for drinking water, planned for use as drinking water, or are in hydraulic connection to drinking water aquifers, and those that are not. For those that are not, use monitored natural attenuation as the default remedy unless that would endanger drinking water aquifers or suface water quality standards.	Research and development of more real-time monitoring devices for soils would be extremely useful and save money and time.	
688	687	5/8/2017	EPA is not an agency that has ever really emphasized the importance of administration and those within the administrative community are usually not consulted whenever new, internal, rules are published for things such as purchase card processes, contracting actions, property management, etc. There is very little leadership in the administrative field because everyone is too focused on their individual work to see or care how administrative actions operate and impact people in offices other than their own, not to mention how much time is spent making purchasing decisions and getting the required approvals for a purchase before it can be done; we often spend hundreds of manpower dollars (sometimes more) to make a purchase that may only cost $50, especially with FITARA approvals are required. It would be nice if there was an effort to establish some comprehensive, administrative SOPs to guide administrative processes, especially for lesser known topics such as inviting outside guests to EPA training,		How about providing better customer service to each other, within EPA? All too often, calls are unreturned or people don't identify when they are out of the office for extended periods. Some people don't bother to answer their phones at all, ever; I have heard voice mail greetings that basically say - 'send me an email because I'm not going to call you back as I'm probably not even checking my voice mail.' We could save so much time and be so much more efficient if folks would just communicate effectively and timely.	See above. Also, too many resources go to supporting the unions - EPA employees should primarily work for the EPA.	Make electronic signatures standard for every process throughout the entire agency, period. There are actions, contracting ones especially, that require everything to be done on paper. This takes so much time and costs so much money to maintain paper records. The same is true for reports submitted to EPA by the regulated community. We should require all paperwork to be submitted electronically and not via binder after binder of printed material. (NARA is expensive! We pay way too much money just to warehouse paper records.)	

AMERICAN OVERSIGHT



AMERICAN OVERSIGHT

689	688	5/8/2017	In Superfund, the Contaminated Sediments Technical Advisory Group (CSTAG) and National Remedy Review Board (NRRB) provide recommendations on response actions to regional site teams. The regions are not obligated to follow those recommendations. It would be more efficient to make the recommendations mandatory. This would eliminate the generation of a regional response to the recommendations, saving time and resources. Stakeholders may prefer mandatory comments instead of advisory recommendations.	Communicate, communicate, communicate. However it is tough to keep on schedule every time resources are diverted to clarify misinformation circulating within the stakeholders. Bring back the Superfund tax.	Same as Q. 2. Speak the truth even if you might make people mad. We are not miracle workers. If we had unlimited resources we might be able to remediate sites to unlimited use unrestricted exposure.			
690	689	5/8/2017	Acquisition and hiring processes require excessive levels of program office participation. There is no such thing as an easy purchase or hire, regardless of the hiring category or acquisition complexity (anything beyond the purchase card). Efforts require continuous monitoring and followup by program office staff and are subject to lengthy, unexplained delays.			EPA has too many program offices providing enterprise IT hosting services.	Just quit talking about cloud computing until TIC compliance and continuous monitoring are mandatory components of FedRAMP. The costs of duplication exceed any potential savings. DHS and OMB have to fix this.	
691	690	5/8/2017		Recently, there seems to be a push to allocate more responsibilities to the states (and fewer to EPA) without allocating the corresponding funds necessary to perform those tasks. Even now, it seems that some states are not able to meet their responsibilities due to constrained budgets, and adding more responsibilities would make it exceedingly difficult for them to perform their jobs properly. EPA's oversight, grants, and collaboration with the states is critical to ensure human health and the environment is protected. Therefore, I believe these programs and relationships should continue to be supported and funded as they have been in the past. Regarding the private sector, I believe EPA needs to maintain its role as a fair and just regulatory agency. Recently, there have		No I do not. I believe our already constrained budget has forced us to reduce costs to the point that further reductions could potentially sacrifice the fulfillment of our mission. I personally perform the duties that, in past years, were performed by two full-time employees, so I feel that further cuts would be very detrimental to our mission of protecting human health and the environment.

692	691	5/8/2017	Lack of 360 management reviews. Although by far not universal, too many managers who lack management skills in both identifying and addressing problems. We promote supervisors to be manager and do not nurture potential managers resulting in some mid and higher level management positions occupied by those who can handle the administrative tasks but are unqualified to manage a program or an organization while overlooking those with strong potential management skills strictly because they do not want to walk away from their work to become a supervisor.	More integrated EPA /STL government research projects and analytical work. Both side have certain expertise and know their specific data. Combined we can leverage the best of all parties instead of relearning what someone else already knows.	Increase transparency of data limitation. List potential techniques for users to identify data gaps List potential techniques to address data gaps in analytical work involving specific EPA data collections. Stronger EPA presence at State and local government conferences to educate attendees on what resources and support EPA has to offer.	Be it a fear, lack of knowledge, or legal limitations in working with congress to address "minor technicalities". A number of regulatory inefficiencies are tied to the governing statutes from congress especially when multiple statutes are involved. Some very basic items such as when a filing or submission by a facility is due to EPA, different definitions of terms such as a 'facility' between statutes.		
693	692	5/8/2017	One example is the egregiously duplicative, parallel processes staff are required to use for submitting regulatory/policy packages to the Administrator for signature. A regulatory signature package will usually consist of an Action Memorandum, the Federal Register document (which for certain types of rules can be several hundred pages long), and if economically significant under Executive Order 12866, the Economic Analysis/Regulatory Impact Analysis (which may also be several hundred pages long and are seldom actually read). EPA staff must: (1) Prepare and submit to OP an original hard copy of these materials as well as a certain number of paper copies (the exact number of copies has fluctuated over time). (2) Send the package files in an email to OP to ensure that the requested package submission is captured as a record in the enterprise recordkeeping system. (3) Upload the files into and submit to OP using the ???ADP Tracker??Â Lotus	For as much consideration as federalism issues will receive, especially in the early days of the Trump Administration, I think addressing policy-level consultations should be considered under Question 3 of this survey. We *can* achieve better environmental results ??? and evaluate the performance of environmental regulations ??? by partnering states, tribes, local communities, or the private sector by sharing information and data that are of a substantially similar robustness. However, there are substantive statutory restrictions on gathering information that would allow the Agency to more effectively and efficiently assess baseline conditions and activities that factor into: (1) whether those conditions are indicative of more widespread, and potentially problematic, hazards/risks, (2) whether practices to manage	With respect to EPA???s Action [Regulation] Development Process (http://intranet.epa.gov/adplibrary/documents/adp09-24-15.pdf) ??? and consistent with the requirements of the Unfunded Mandates Reform Act and Clinton-era Executive Orders 13132 and 13175 ??? the various rule-writing AA-ships are expected to involve affected/interested representatives of state, local, and tribal governments early in the process of developing an action in order to formulate and present rulemaking options that already take the concerns of those governments into account before presenting the options to Agency officials for a decision. To the extent that this occurs, I believe that the Agency does this well, and I believe that most of the intergovernmental associations would agree. Where things begin to unravel a bit for the Agency is in what, when, and how the Agency communicates with those	Yes! EPA is at a unique moment in history as it is making decisions about how to implement various directives and mandates, both old and new. The Administrator???s Office could consider establishing rigorous new management controls to (re-)enforce these Agency obligations. For example, consider section 3 of EO 13563. ???Some sectors and industries face a significant number of regulatory requirements, some of which may be redundant, inconsistent, or overlapping. Greater coordination across agencies could reduce these requirements, thus reducing costs and simplifying and harmonizing rules. In developing regulatory actions and identifying appropriate approaches,	Yes. Phase-in a requirement that EPA???s Federal Register documents be signed electronically to streamline existing processes and reduce production-related waste.	No firm opinion. If realigning activities is meant to refer to a potential deference to actions by other agencies or states, they should at least receive an appropriate level of funding and technical assistance from EPA to take those actions on.

AMERICAN OVERSIGHT

	I
692	Demotion or appropriate lateral shifts. When we promote good people to their level of incompetence we keep them there instead of moving them to a position which actually meets their skills. We lack a system to identify and monitor potentially good ideas which were never well thought out. Managers who take credit for them continually spin the spin instead acknowledging the truth and bringing in the experts who knows how to trouble shoot and resolve problems.
693	No firm opinion.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
694	693	5/8/2017	Multiple time keeping sheets, Currently we have two systems (People Soft and Lotus Notes MaxiFlex). Really one time sheet would suffice. Eliminate one time sheet (Lotus Notes Format).	EPA staff with oversight responsibility should be required to stay current with field sampling and analysis procedures. They should rotate in and out of field work teams and perform field studies along side the state, tribal or contractor staff. This gives the oversight personnel more credibility with partners. Managers should be subject matter experts when dealing directly with states and tribes on different environmental media.	Bring back administrative staff to answer phones. New technology has left a large segment of the population behind who get tired of trying to navigate websites (many of which are out of date) or leaving messages. Often times, people would like to discuss their questions and/or issued with a real person with some basic knowledge of who they should refer them to.	Inefficiencies are largely the result of cost cutting without thought of the big picture. We are very short staffed in the field and analytical programs and most of us wear several hats. As technical staff, we also have to serve as their own travel agent, administrative staff, health and safety staff, janitorial staff, etc.... Also, the amount of online training we are required to take is out of hand. I think the tax payer interested in environmental results would be better served if I was able to devote more time to hand on environmental work and keeping my fingers on the pulse of the environment as opposed to managing excessive paperwork and redundant online training.	Not new. Administrative staff. It would be very helpful for data entry and paper work, responding to FOIAs, etc....	More and better managed travel resources allowing EPA scientists to attend conferences with scientists from other federal and state agencies. This is where a lot of good partnerships are formed. Also, more detail opportunities allowing staff to work in other agencies on a temporary basis would be beneficial.
695	694	5/8/2017	Processes within EPA need to be streamlined. Meetings are important for ensuring that EPA is moving in a coordinated fashion. As such, we need to minimize the red-tape for holding conferences. IT managers need to hold degrees in IT. One of our biggest budget elements is IT yet we do not have folks that are experts in this area managing those programs. Ensure that policy documents before 2005 are findable. with the change in email structure -- older documents have been lost and we will not be able to respond fully to FOIAs. The WEB Drupel roll-out was poorly done and we still do not have access to all of our documents and neither do our stakeholders. Need to determine if the way $$s are spent on computer systems make sense.	We need to learn from site such as Flint -- the people need to come first and not allow situations like Flint to fester. EPA has a role and needs to do its job. We need to work with the states but in the end it is EPA that is accountable or should be. Need to identify priority pollutants and work with the states and tribes to make sure that we are protecting the people - again look to Flint. Lead is the poster child for environmental exposure and we are using outdated information. Need to issue updated MCLs for emerging priority pollutants -- e.g., lead, PFOAs, PFC, etc. Lead -- Need an agency position on what blood lead level is protective - and suggest we go out with a FR notice seeking comment on this. Reuters report June 2016 says that many pediatricians are not testing children for lead so our data that	Need a better access channel for citizens to talk with our leaders. They should not have to work too hard to be heard by our management. By the time they often get in the door a lot of damage has already been done. What happened at Flint -- why did it take so long? What will we do so that we don't have another Flint? What will we do when it happens again? We need checks and balances -- not red-tape, but ensuring that the important issues that affect our people are not ignored. What went wrong at Flint and where is our next Flint? That should be the question that is asked constantly. We need to help industry comply with the laws -- more web based training, and more hand holding.	Do a better job of IT and ensuring that all documents are up on the web and are word searchable. If we have data about portions of the country -- the citizens should have access to the data from our Web and should be able to manipulate the data We need to do all of this more efficiently -- hire managers that understand IT and have degrees in the subject. Also -- look at our bottom line before we pay for details to HQ. We have really good people at HQ that we should be developing and we don't incur the travel costs of a detail traveling and staying the DC area. Show your EPA people that you believe in them -- make sure that the expert staff are involved in discussions at the	Make the most of the Web and IT -- do not run from it but embrace it. Data and the truth will ensure that we have credibility with the public. If things go bad -- own up to it. If we don't know -- own up to that. When we do something good or challenging, own up to that. The environment is the Space program for our citizens -- planet earth comes first.	Lead is an excellent example of a contaminants that needs attention by all parties involved. There are separate roles for each -- HUD for lead in poor housing, States for areas not covered by federal regulations, and EPA as the backstop enforcement our laws, working with all parties and industry, and helping to advance the science. We need to have the best science as to what is protective and then we all need to work together to lower the lead exposure in this country. We should view this like we did Space Exploration -- by the year XXX -- 99% of all children have a blood lead level below 2 ug/dl.

	A	B	C	D	E	F	G	H
696	695	5/8/2017	We have lost much of our clerical staff under the last administration. Administrative tasks such as filing, scanning, and records retention activities consume much of our time. We need to hire more administrative/clerical staff.	EPA should make resources available to convene and/or host partnering agencies and non-governmental interests to conduct dialogue that clearly established national standards and provides our partners the opportunity to identify success and road blocks. As an ongoing measure we need additional staff to coordinate and track state and local achievements.	We need additional staff. Under the past administration, our workforce has steadily declined, and we were continually asked to do more with less. We need additional staff to provide attention and foster trusting relationships with our partners that we serve.	With recent workforce reductions under the past administration, we have been unable to complete mandated activities which makes EPA vulnerable to 3rd party lawsuits. Our workforce is so greatly diminished that no one project receives the attention it deserves, so the workload as a whole stagnates. We have more work than workers, by increasing our workforce, we can avoid costly lawsuits and more efficiently complete critical assignments.	A full integration of National, State, and Local programs onto one common and transparent platform. Such a platform would identify all required fields to meet national standards and provide state and local governments the opportunity to expand the platform to represent all of their requirements and activities. Such a platform would make oversight more efficient, encourage more effective program implementation, and the complete transparency would improve accountability of both the regulating agencies and the regulated community.	We need to hire new personnel to serve as liaisons to partnering agencies at both the staff and executive levels. Such engagement can help to align efforts and priorities, and ensure reduced duplication of effort.
697	696	5/8/2017	Due to incompatible work tracking systems and also because EPA is under such a high level of scrutiny from Congress and some members of the public that do not share the values of environmental protection, employees are required to perform redundant work and time tracking management tasks that are time consuming. One time tracking system for leave, credit hours, site charging, travel comp time, and timekeeping should be utilized. Currently we must separately submit leave requests in People Plus, reenter leave hours in our People Plus timesheets, maintain and sign separate Excel spreadsheet forms for credit hours tracking, complete separate forms both before and after travel comp time is used, track telework site charging separately from in-office site charging, keep Outlook calendars updated, and update schedules in Lotus notes. This is a redundant administrative burden on employees.	EPA needs adequate funding to continue and expand the important work done with states, tribes, and the private sector. FY2017 funding and staffing levels are inadequate to carry out the important work of EPA. Cutting both funding and staffing at all in FY2018 is unreasonable and irresponsible; cutting funding and staffing by 20%-30% or more is reckless. These environmental partners depend on grant funding, support, and guidance from EPA in order to complete their targeted work. These partners are necessary to collaborate with EPA, help fill staffing voids where EPA funds and staff cannot, obtain necessary location-specific information to work smarter, and employ a science-based, somewhat standardized approach to environmental matters at the ground-level.	EPA can provide better customer service to other agencies and the public with more qualified EPA staff. EPA currently operates at staffing levels from the 1980s, which is unsustainable. Hiring freezes should be lifted immediately and staffing levels should be increased to at least 18,000 - 20,000 EPA employees. More student interns should be hired and utilized to provide needed work experience to qualified scholars as well as needed, low-cost support to EPA offices. The proposed staff cuts to EPA are short-sighted and must not be implemented. EPA's budget is paltry in comparison to the U.S. defense budget, yet EPA's mission impacts every U.S. citizen every day. EPA employees implement the clean air, water, and community revitalization programs that are essential to all Americans.	The first and most important way to reduce costs and inefficiencies at EPA is to remove the non-scientist, anti-environment Trump political appointee team in senior management. Obstructing science and undoing years of research and progress by instead pursuing ideological goals to undo environmental protection is abhorrent, and a misuse of public funds. EPA is a public agency rooted in environmental science and research; decisions on policy are based on peer reviewed research and the scientific method. The so-called "HONEST Act" is an insult to science, scientific progress, and a danger to Americans. Congress and the Administration's current appointees need to allow	No one at EPA should still be utilizing landline phones--especially jobs with the demanding work, travel, and meeting schedules of EPA. All EPA employees should be assigned a smart cell phone instead of a landline in order to be more responsive, efficient, and effective at performing our jobs.	There is no other Federal agency with the overarching, unbiased mission of the EPA. The EPA is the most renowned environmental organization in the U.S. and the world for a reason--the unique mission of EPA must remain intact in order to ensure that all Americans, regardless of State, territory, or income level, receive equitable environmental protection. EPA activities for the most part cannot be "realigned" to states because economic competition between states will unduly influence levels of environmental protection. State

	I
696	Here are three, fairly universal and standard, best practices for executive managers that are utilized at highly successful private companies across the globe: 1. Hire enough people to do the work that needs to be done. 2. Don't browbeat your dedicated workforce by piling on more and more work with fewer and fewer resources. 3. Don't threaten the livelihoods of your workforce with arbitrary workforce reductions. They are pretty standard. Would be nice if they applied at EPA and all other federal agencies, since they don't apply today.
697	The vapor intrusion working groups within EPA regional offices are top notch; the team effort to assess and determine the most practical yet protective way forward in this emerging field are essential to solving VI problems nationwide. Ideas from working groups should be periodically assessed in order to update work practices and regulations, and incorporate lessons learned and a level of proficiency and efficiency.

698	697	5/8/2017	PeoplePlus is due prior than the end of the week. For programs, such as Superfund, where we charge specifically to a site, this requires us to submit a timecard prior to Friday night. We always have to go back and amend the timecard, requiring additional time by staff, timekeepers, and managers. Change the process so we submit the timecard Friday night before we leave.					
699	698	5/8/2017	n/a	By continuing to provide states, localities, and tribes with money, we can help them to achieve better environmental results.	Involve stakeholders early and often, and be transparent to the public throughout the entire process.	n/a	n/a	n/a
700	699	5/8/2017	I have a concern with directives from management that we must consider factors that are unrelated to the statute being enforced or the exigencies of litigation when managing and resolving enforcement actions. The worst examples happen when the defendant or its industry are favored by the current administration. The solution is to stick to the basics-- return the defendant to compliance, deter future violations, and require the defendant to clean up, or if that's not possible, compensate for the damage it caused.	I honestly think that we already do a great job of partnering with states, tribes, and local communities. I'm in enforcement, and the nature of my work does not lend itself well to partnering with the regulated community. I've negotiated industry-wide enforcement agreements that required more cooperation than usual with the regulated community, but you still have be aware that you are in adversarial relationship with other side or you risk serious ethical problems.	I have none.	The vast majority of employees at EPA are incredibly competent and hard working. However, even one or two incompetent employees, including managers, can gum up the works. I've seen several instances where everyone knew that a particular employee or manager was creating a problem, but it took years to address the situation. I'd like to see federal personnel rules revised to make it easier to both reward good employees and to remove bad ones.	Keep hardware and software as up to date as possible.	I think the current system works well with states and have no suggestions for changes. We've done a good job working with delegated states to get the job done, avoid duplication and provide assistance when needed. We don't necessarily have over-lapping jurisdiction with other federal agencies, but we are often at the same facility at the same time addressing the same set of facts, albeit with different goals in mind. For example, there might be an explosion at a facility that resulted in a harmful release and employee injuries and both EPA and OSHA might be responding.

701	700	5/8/2017	Lack of training resources. We are unable to attend professional conferences to hear from the regulated community what issues are out there and we are always behind the curve for awareness of new technologies.		Responding to citizen inquires within 24 hours of receiving them. Being there for the regulated community when they have questions or issues related to their situation.			For the Aircraft Drinking Water Rule, our EPA rules need to better align with the operational requirements of the Federal Aviation Administration (FAA) and Food and Drug Administration (FDA). Air carriers wrote their operational guidelines and maintenance requirements based on FAA and FDA requirements way before EPA even came out with the rule. EPA does not take into account how difficult it is to take a moving water system and conduct maintenance to it and how to address stored aircraft due to business reasons of the air carrier. Also, EPA staff had no training on an aircraft
702	701	5/8/2017	Superfund - many sites have special account monies which are designated to be spent on site activities. It takes too long to procure these funds and thus results in delays in implementing remedial activities. The process to utilize these special accounts should be streamlined. One way would be to simply allow whichever EPA Region where the special account site resides to handle and manage these accounts. Superfund - 26 US Code 198 should be revised to allow sites on the National Priorities List (NPL) to deduct expenditures for remedial activities from taxes. Not allowing tax deductions for remediation expenditures on NPL sites does not provide any incentive for companies to cleanup sites. Allowing these kinds of tax deductions would also entice outside parties (e.g., developers) to consider performing remedial activities and thus cleanup NPL sites.	Private sector - see above comment concerning 26 US Code 198

703	702	5/8/2017	Uncertainty due to lack of senior level staffing.	Commit to the mission. Provide adequate funding and maintain current staffing levels.				Question too broad to answer. I do not trust that senior level management have any interest in making EPA more effective or efficient, Actions from political leaders to date send the clear message that their only interest is in destroying the agency with glee and getting rid of employees.
704	703	5/8/2017	1. Contracts ??? EPA???s process and speed for reviewing and approving contracts and task orders needs substantial improvement. In recent years, the time needed for internal review and approval of contract paperwork has lengthened considerably, often causing unnecessary stop-work situations. OAM needs to have more warranted contracting officers on staff to handle the work and needs to have a customer-focused approach to work. 2.Hiring ??? the overall federal hiring process, as well as the internal EPA process, is slow and cumbersome. The existing system requires months and months of time and qualified candidates are often frustrated at the time and uncertainty involved. While hiring internal candidates among EPA offices is relatively fast, it typically takes 9 months to a year to bring in an external candidate. In demand labor categories (e.g., software programmers, engineers) are very hard to fill given the long time needed to apply, interview, make the	Use EPA resources to provide greater national transparency to the public on environmental results from states and private sector - greater use of real-time monitoring tools, improved websites for public access to air and water quality information	Provide resources for states to participate in meetings with EPA and to participate in national conferences - many states, localities, and tribes have limited travel dollars	Improve customer-focused service ??? Some parts of EPA, such as OEI, OCFO, and OARM, tend to make decisions that affect the entire workforce without adequate input and feedback from the affected staff. These decisions include new software changes (e.g., People Plus) and new policies (e.g., on hiring or promotions) that affect everyone at EPA. Often, by the time the working level hears of the change, we are told that the decision has been made and that there is no opportunity to provide feedback or alter the direction. Instead of these arbitrary decisions, major changes should be piloted gradually, using tools like focus groups or surveys to gather useful feedback to improve the change.	Computer hardware and software improvements ??? In recent years, computer software changes have improved, although legacy software (such as Lotus Notes) continue to be used in some applications. It does appear to the staff that computer hardware purchasing and leasing decisions don???t always provide the greatest value to the government. Laptop leasing contracts in particular appear to the staff to be over-priced, given the high cost of the annual lease and the long period of time between equipment upgrades.

705	704	5/8/2017	Added management initiatives have adversely impacted my ability to complete statutorily required EPA requirements. I have been adversely impacted by LEAN projects that will not reduce or eliminate any financial or staff time commitments. The LEAN initiatives appear to be an attempt to show efforts of reducing bureaucracy. However, a new bureaucratic kingdom has been created and no real analysis of results and the amount of resource time that has been spent on the projects have been completed. In addition, outside consultants are hired to shape inherently governmental functions without experience or background in the subject matter. This initiative is the latest in a long line of snake oil salesmen that will hopefully, very soon, go the way of the many "quick fixes" before it. Unfortunately, EPA will be left with a kingdom of highly paid individuals to gift back to the program areas to deal with.	Timely, direct responses from HQ on issues raised by the regions and states. Less reliance on guidance from HQ and more technical implementation assistance for the rules that they have written.	Electronic records. The ability to provide the public with an on-line tool to submit permit applications and research facility information would be helpful. If an electronic permit application tool was created that ensure that proper information was submitted, then permitting timelines would be reduced simply because the application could not be submitted without the proper technical information.	Reduce the amount of non-statutorily required "management" of media program areas.	Electronic file management systems	
706	705	5/8/2017	N/A.	Placing program people in key locations where our stakeholders are located would be an invaluable approach to improving results, providing better service, and reducing costs. A small office could be established in strategic locations in each State to ensure that EPA staff, across all programs, are available. This approach would reduce costs by lessening the amount of high rent space in Regional hub cities and would reduce travel time and funding when working in those States where we currently don't have staff. This will also provide a direct link between States/Tribes/Communities/Private Parties which has been shown to be a tremendous benefit in the few locations where this is already being done.	See answer to Q2.	See answer to Q2.	See answer to Q2. Current communications technologies will allow for a more mobile EPA by moving staff out into all of our States.	See answer to Q2.

AMERICAN OVERSIGHT

	I
705	
706	See answer to Q2. Region 10 is a good model to look at for this idea. Regions 3, 4, & 5 have multiple staff located in States to provide direct support. These Regions have all reported tremendous and cost efficient results by out-stationing staff.

707	706	5/8/2017		Partner with state and private universities to research the vast number of chemicals in use, for the purpose of defining their health effects and properly managing the risks posed by such chemicals.				
708	707	5/8/2017	Having woefully unqualified leadership.	Not having woefully unqualified leadership.	Not having woefully unqualified leadership.	Not having woefully unqualified leadership.	Not having woefully unqualified leadership.	Not having woefully unqualified leadership.
709	708	5/8/2017	Annual refresher trainings that cover the same materials year after year. There is no reason these could not be every three year trainings. Training requests that have to go through one person in the management division, are time consuming and unnecessary. Streamline the process, my supervisor knows what classes I need and divisional staff know what funds are or more than likely not available.	While we have moved to an electronic environment, there are still times it is necessary to meet with people face to face. The yearly concerns over travel budgets makes this next to impossible.	Open up to why things are happening. We are too concerned at times with deliberative issues and rather than working with all constituents we focus on one set, whether that is industry or environmental organizations. We have become a more politicized agency over the last few years and the early months of the new administration are showing that same trend.	Consolidation of space. Hoteling or sharing of cubes as we move toward a more flexible workforce.	We are finally moving in the right direction, however still lag behind the rest of the nation.	There are multiple agencies with environmental divisions. Some are in charge of cleaning their properties (DOD and DOE) and others have remnants of programs that have been kept over the years for political reasons. Of course as an EPA employee, I think they should come to us but it needs to be reviewed.
710	709	5/8/2017	Rethink any managers who aren't skillful at messaging/targeting audiences/communications in general. This is a critical skill in this day and age, to ensure we clearly articulate that "back to basics" does NOT mean disregard of environmental protection.	It's time to be more streamlined and strategic in how we partner with all these stakeholders. At this point, the communications between HQs and regions is so poor that this weakness "spills over" into how we support the states and others. Let's take a step back and get on the same page as an agency.	Clearer, more consistent communications, focused on clear priorities (which have been missing over the last few years). This is an integral first step to many other critical sub-steps.	YES. However, mine are strictly from a regional communications standpoint- this includes rethinking all that we do; WHY we are doing it (please don't tell me again, people, that it's because "that's how we've always done it"), and stop being so reactive as communicators. We need to get IN FRONT of the message, not always trying to react to it.	YES YES YES. But unfortunately, the comfort level with using Insta, FB, Twitter, etc that civil servants who populate the mgmt levels in communications is so low, and they are so unsure of how to approach this new world of social media, that the answer, when presented with a great idea to target a great message, is invariably, "No".	I feel like this question is basically the answer to the issue- we need to do MORE realignment of activities and shared responsibility. This way, the American citizen isn't left wondering "who are these people? EPA? the state? the locals? Who can I trust? And who can't I trust?"

AMERICAN OVERSIGHT

	I
707	
708	Not having woefully unqualified leadership.
709	Technical training/trainers in the program. Too often there is a set of trainers or coordinators in charge of training who are great for the non-technical trainings, but there is not enough of a emphasis on the technical. The ORCR training team has spent several months doing this - HQ contact is **[REDACTED B6]**
710	We should be incorporating accountability measures used in the private sector for our communications work. That way, less time is spent diddling around with "should we do this, should we do that" while worrying about getting "dinged" by headquarters, and more time is spent be strategic with messaging #backtobasics- and what that means and doesn't mean. It's also time to clean house. The folks who populate the upper echelons of communications have gotten there through seniority, not skill- this makes it very hard to get good ideas through. In private industry, accountability in reaching goals prevents this from happening to such a

	A	B	C	D	E	F	G	H
711	710	5/8/2017	none are unnecessary, using Lean to identify streamlining of identified processes is extremely valuable			Employ Lean, increase its availability across the board to squeeze points in processes	MeetingSphere is a valuable collaboration technology that has capabilities we do not currently have	payroll acquisition and procurement
712	711	5/8/2017		Reengage with the Local Emergency Planning Committees at the federal level and provide additional federal grant funding for planning and exercises.			Custom designed drones to replace existing aging technology (ASPECT and TAGA) for air sampling and situational awareness during large scale or remote emergency responses.	Using the National and Regional Response Team models in the National Oil and Hazardous Substances Pollution Contingency Plan, develop muti-agency coordination groups set in regulation or presidential directive. An example would be the interagency Alaska permitting group lead by DOI.
713	712	5/8/2017		EPA and states get great results when we work in partnership - and these are facilitated by familiarity. The more we know about each others' goals, capabilities, and constraints, the more often we'll spot places where we can work together. Personal relationships really help, too. One idea: greatly increase the number of 1-2 year details between EPA and state environmental agencies. If a substantial percentage of EPA staff had state experience - and vice-versa - we'd have much more of a sense of common purpose.	A lot of people rely on EPA's website as a source of scientific information, and this should continue. As the new administration understandably changes policy material on the site to reflect its own views, it should leave the science intact unless there's good evidence that it's wrong. Otherwise, we look like we're politicizing science. To the extent the new administration's views are based on credible science that's not yet on the site, it should be added.	National consistency is important, so some HQ coordination and oversight of regional work is essential - but there's currently too much. This creates great inefficiencies. Not only are many matters double-staffed (HQ and regional), but those staff sometimes spend considerable time resolving disagreements, which are often not issues of national consistency but simply personal views. Much HQ oversight should shift to the "audit" model, where regional work is spot-checked rather than continually supervised.	We need to find a way to get email on mobile devices - crazy that we can't do this in 2017.

714	713	5/8/2017	The use of "Smart Cards" to operate our computers seems like security overkill and every morning and every subsequent log in throughout the day the requirement eats up a minute or two of potentially productive time. Recently I received a letter saying my photo needed updating. There was no deadline for having the photo updated and I ignored the request, expecting to be reminded. I never received any reminders and one morning I found that I was no longer able to log in to my computer. Learning that the problem was associated with the Smart Card and the fact that I'd ignored a single email from a month earlier, with no follow up reminders, took over an hour. Finally, the EPA Call Center CTS person turned off my Smart Card requirement for log-in for 30 days.There was no hesitation to turning it off. This action seems like good evidence that the Smart Card log in requirement is unnecessary and a waste of many EPA workers' time. I realize I've rolled a couple of complaints into one comment. My primary comment is to	Study the impacts of rules on local communities more closely. Use demographic and economic data to better characterize workers and communities affected by proposed EPA regulations.	The opportunity for commenting on proposed rules and other requests for information is currently provided to all these entities. In my experience, all rulemaking workgroups work carefully and diligently through all these comments. Public listening sessions are also helpful and could perhaps be increased in number.	More electronic transmission of information. For example, converting the RCRA hazardous waste manifest to an electronic system would greatly improve efficiency. Relying on paper is antiquated, slow, and wastes resources.	In general, the EPA Call Center is too slow to respond. In addition, our lap tops are very old, very heavy and a chore to carry home on weekends. Finally, access to EPA email without my work laptop is cumbersome, slow, and difficult. Bringing home the laptop is important because of the poor accessibility to work email through home computers.	Perhaps coordinate on cross-government metrics such as the value of statistical life.
715	714	5/8/2017	One of administrative requirement that I feel reduces EPA employee???s efficiency is entering our time into People Plus. In Region 5 we are required to enter our time by the Wednesday/Thursday before the end of the pay period. Being on the Maxiflex schedule the last day or two of my schedule is most likely going to change. When there is a correction to People Plus it wastes my time, the APA???s Time and my supervisors time. If we were able to enter our time the Monday/Tuesday after the pay period, my time would rarely change and there would be no need to go back and adjust people plus. I estimate that I spend at least 10 minutes a pay period making the adjustments and making sure to notify my supervisor. With today???s technology payroll should be able to turn things around a lot quicker and reduce the need for early time and attendance report. If they cannot we should look at a new vendor.	Funding is always an issue, but I feel it is the most consistent way to partner with our states. Absent federal funding, EPA needs to do a better job discussing the issues with state governors/legislatures. We rely a lot on the state???s environmental programs to promote themselves. If we had a forum or the ability to discuss the benefits of our environmental programs with state governors/legislatures maybe this would help drum up additional financial support and help run better state programs.		One of my jobs is to write enforcement action notices to facilities that are out of compliance. I don???t do a lot of them, but every time I write on I have to change the documents because it does not meet EPA???s correspondence guidance. This can be really frustrating and time consuming as well as wasteful. My suggestion is that we create a division/Section that all they do is review letters and documents to make sure that they meet EPA???s correspondence standard. Let the technical people draft the document, but have separate staff polish the documents for the public. This would save technical/supervisory staff time as well as reduce paper, by not having to redo the document so many times. I	As an inspector we should be using electronic tools to help conduct inspections. That would include using tablet or smart phones to enter the inspections. The information gathered can then be entered into the appropriate databases. Most of the states have taken advantage of these tools. This would allow us to be more consistent and save us time entering data.

716	715	5/8/2017	One of administrative requirement that I feel reduces EPA employee???s efficiency is entering our time into People Plus. In Region 5 we are required to enter our time by the Wednesday/Thursday before the end of the pay period. Being on the Maxiflex schedule the last day or two of my schedule is most likely going to change. When there is a correction to People Plus it wastes my time, the APA???s Time and my supervisors time. If we were able to enter our time the Monday/Tuesday after the pay period, my time would rarely change and there would be no need to go back and adjust people plus. I estimate that I spend at least 10 minutes a pay period making the adjustments and making sure to notify my supervisor. With today???s technology payroll should be able to turn things around a lot quicker and reduce the need for early time and attendance report. If they cannot we should look at a new vendor.	Funding is always an issue, but I feel it is the most consistent way to partner with our states. Absent federal funding, EPA needs to do a better job discussing the issues with state governors/legislatures. We rely a lot on the state???s environmental programs to promote themselves. If we had a forum or the ability to discuss the benefits of our environmental programs with state governors/legislatures maybe this would help drum up additional financial support and help run better state programs.		One of my jobs is to write enforcement action notices to facilities that are out of compliance. I don???t do a lot of them, but every time I write on I have to change the documents because it does not meet EPA???s correspondence guidance. This can be really frustrating and time consuming as well as wasteful. My suggestion is that we create a division/Section that all they do is review letters and documents to make sure that they meet EPA???s correspondence standard. Let the technical people draft the document, but have separate staff polish the documents for the public. This would save technical/supervisory staff time as well as reduce paper, by not having to redo the document so many times. I	As an inspector we should be using electronic tools to help conduct inspections. That would include using tablet or smart phones to enter the inspections. The information gathered can then be entered into the appropriate databases. Most of the states have taken advantage of these tools. This would allow us to be more consistent and save us time entering data.	
717	716	5/8/2017	After being here over a dozen years and having experience in both other Agencies and the private sector, I can say this: There are thousands of ways we could improve the way EPA operates. Start with organizing the 10 regions consistently. 2 We don't need almost as many people at HQ as we have in the Regions, most of whom have no clue as to how things work in the field. 3 Our business processes aren't even defined. Everyone does what they want/learned how to do on their own. 4 There is no formalized training, not like I've had in the private sector or in the military. 5 There is no accountability. there are dozens of useless staff sitting around EVERY day and yet they remain on the payroll. The "useless idiots" (as deemed by mgmt.) do the majority of the work, usually getting no reward other than more work. 6 We contract out all of the real work, which costs us millions each year. With no truly standardized or defined processes, there's not much ground for one to declare the contractor's proposal invalid. They	How about we start with jointly defining the problem with all stakeholders, then working to devise a solution. There are dozens of examples I could give, but admittedly, while I STRONGLY support the current administration, I'm waiting to see if anything actually happens. Usually, all one gets for trying to improve something is a at best abuse and more work; or in some cases, actual reprimands for things that never occurred. This is a very corrupt and dark place!	Begin by asking for their assistance. We have such an adversarial mindset here. During Katrina, it became readily apparent that our Response actions were used to generate Enforcement actions. No one wants us "snooping " around because they know it only means trouble. Instead of trying to demand that "we alone know what's best" maybe, just maybe, we could allow others to explain their position and develop practical solutions that allow businesses and industry to operate if not flourish, while keeping a reasonable approach to environmental stewardship	Yes, numerous ones. But these will only have a chance of occurring after you get rid of virtually every GS-14-15 and ESPECIALLY the SES workforce. They are overwhelmingly, the problem. Being lower graded, (which I'm not) doesn't mean you have all the ideas, but most chances for good ideas are going to come from those not so heavily invested in the status quo, or at least being made to support it , in order to survive.	1 You'll have to purge virtually everyone at OEI and RTP, especially the contractors. None of the technological programs work. Our software is junk and our processes are so horrific, when I relay these to colleagues in other areas, they laugh at me. Much more to add, but again, I'll believe in true change when I see it.	There are countless ways. I just floated an idea along these vary lines at a meeting at HQ in late March. Within minutes, over a dozen attendees cornered me and dressed me down for having such a stupid idea. I also got castigated for being to militaristic and as frequently occurs, "you're not an environmentalist, so you just don't understand." True enough, but I do happen to have a business degree and do very much understand this odd notion of cost/benefit analysis. However, at EPA, benefit isn't measured in economic efficiency, rather it's measured by how good it makes me

718	717	5/8/2017	We use smart cards and pin numbers to log into the EPA network. However, when using various applications, we have to use additional usernames and passwords. Single sign-on is suppose to take care of having to remember several usernames and passwords. However, each system has a different time range in which usernames and passwords expire and thus have to be changed. This results in frustration and time wasted. It seems apparent that once we are logged into the EPA system, we should not have to utilize additional usernames and passwords for any application under the EPA system. Therefore, the entire EPA computer system should be reconfigured such that once you log in with your smart card and pin number you should not have to utilize any other usernames and passwords.					
719	718	5/8/2017				1. Strengthen EPA's security program, in part by incorporating in OARM (1) the Administrator's protective detail (from OECA); (2) the Agency's new Insider Threat Program (from OHS and other EPA offices); (3) the intelligence function (from OHS), and perhaps other EPA security functions, as well.		1. Explore the consolidation of at least some EPA intelligence program components with similar program components in other non-Intelligence Community (non-IC) federal agencies to enhance performance and reduce costs.

720	719	5/8/2017			Instead of eliminating the EPA???s extramural research grants program, transform it. Make it work for State and Local governments. Make Washington work for America. Long before the federal government was given a regulatory role in environmental protection, Congress established federal research programs to support environmental management efforts at the state and local scale. Making good environmental policy requires good science, but states and local governments do not have the resources or capacity to conduct research programs. They rely on the federal government to invest in research universities and small businesses to develop the knowledge, tools, and trained experts that they need to address their environmental challenges. However, since EPA???s extramural research grants program was			
721	720	5/8/2017	The requirements for submitting rulemakings and other federal actions to the federal register is incredibly inefficient and outdated. I don't know why the same function cannot occur through submitting Word and PDF documents. The review process is overly burdensome (for me as a non-supervisor and my supervisor). It should be done as quick and as timely as submitting a rating for a car service (i.e., Lyft) ride.	Allow scientists to do their job. They should be able to set public health standards and it is up to the policy makers to design regulations to meet those standards. Incorporating "industry" into this calculus diminishes the effectiveness of the scientists, public health standards, and EPA. If you buy into the plight of industry, go work for Dept. of Commerce to address the real economic issues.	This question implies we don't already do a good job. I don't see that -- so many of my colleagues pour their heart and soul into supporting tribes and consulting with states. We would be able to provide better "customer service" if the politically-appointed leadership would stop sending mixed messages about priorities and motives. We could provide better customer service if leadership set their agendas aside and provided support more broadly to staff -- allowing us to travel to meet with our state/ tribal counterparts and investing in technology that enables improved communications.	The hubris of this new administration exacts an enormous cost on the agency. A narrow election win should not cause such upheaval. The amount of time spent now and in the future to re-think our recent actions doesn't allow us to move forward. The untapped opportunities were already tapped, the new administration just put a cap on them.	The new administration wants to cut our budget. I'm not sure now is the time to implement new technologies. Much of our work can be brought online and made more sharable across regions, but it takes an administration that believes in staff/ technology to move something that ambitious forward.	There are federal requirements governed by federal requirements (including judicial decisions that interpret those requirements and endangerment findings) and there are state requirements, governed by state priorities. It's best to maintain an element of federalism in environmental protection.

AMERICAN OVERSIGHT

	I
720	
721	Best practices that are also best in class? Is that like a super-size meal? I find it best when scientists are able to do their job, policy makers analyze and communicate scientific findings, and politicians communicate truthfully to their constituents and explain all options, that would be a best practice, or best in class, or whatever catchphrase you want. This is the federal government, good luck with improving efficiency, increasing accountability, and/ or reducing costs in four years. It can't be easily boiled down to 140 characters.

AMERICAN OVERSIGHT

722	721	5/8/2017	Functional directory - our office no longer has a public information desk and callers sometimes are routed to me because I've been with the agency for 28 years. As many staff are retired and restructuring, a functional directory (regional, national, state, local) would be helpful to alleviate caller frustration.	Development of rules (guides) for attaining goals instead of eliminating them. The guides help build capacity. We should be developing/implementing rules until someone else is able to take over. Eliminating rules without a replacement mechanism is chaos without limits, inefficient and short sighted. It doesn't help anyone.	Avoid voice mail jail, we should have public lines answered during operating hours.	Stop trying to rewrite how things are done and measure focus more on how we help improve the environment and who we should be partnered with, not downsizing. Collaboration takes people and time.		We can rewrite the boundaries for each agency/department as long as the public doesn't lose service and staffing moves from one to the other. We should work on a transition of resources from one to the other as part of the total plan instead of broad general cuts at the Federal level. Do the states have capacity? Are they prepared to pick up what is cut at the Federal level?
723	722	5/8/2017	we have archaic and unprofessional performance and time administration processes. To truly be an outcome oriented, and professional organization, the agency must revamp our useless PARS process, move towards a more feedback and reward/award (bonus) based system focused on results that make a difference for the mission. A component of this would also be to reduce our focus on time card and schedule management. This need and the systems/processes it requires, mandates significant administrative overhead, both in terms of FTE and time of our employees. Systems exist that more efficiently allow employees and managers to manage schedules without a blind focus on time cards, work schedules, leave slips, etc. Evaluating and updating these antiquated approaches will allow for more innovation, improved productivity, better work/life balance, and high job satisfaction.	Technology. We are purely unable to appropriately invest in technology that will make partnering, with our fellow regulators, monitoring our environment and interacting the public.

724	723	5/8/2017	Most of the backbone software systems that EPA has selected are inefficient and unwieldy. These include People Plus, CONCUR, property management, document management (operated locally instead of nationally), and training. Contracting and contract management. Their use wastes many staff hours. These systems should be replaced or combined with more efficient/effective systems that are used by other Agencies. Contracting Officers and Project Officers are undertrained and do not understand or follow basic Federal contracting regulations and requirements. Existing training and operations of other Agencies (DOD) should be modeled/adopted. This would result in more efficient contracting operations for both EPA and less confusion for our contractors.	EPA projects frequently do not partner with other stakeholders or take into account the broader impact of its decisions. In cases where partnering is done, EPA has already determined the path that will be followed and does not take into account these other partner's viewpoints. By involving stakeholders earlier in the process and addressing their viewpoints, a more comprehensive approach may be used to guide planning and decision-making.	It seems that EPA's overall approach is that the regulated community is doing its trying to only the minimum regulatory requirements. In fact, in many cases they do their best to "do the right thing" but because of the complexity of the regulations they may not achieve this goal. EPA inspectors look for basic errors and attempt to identify all non-compliances no matter how minor. EPA should first assume that this is what is being done and provide technical assistance; only if the non-compliance continues should a stronger approach to enforcement penalties be pursued. In other words, assume "innocent until proven guilty" first. The latter is often the approach that is taken by States.	Project planning often does not follow the scientific method and consequently results are unusable with the resources wasted. Better planning would result in much more efficient and effective use of resources with more defensible science. The data generated is then unsuitable to address the decisions that are supposed to be based on this information. The ten EPA regions frequently operate as if they are 10 EPAs rather than parts of a whole Agency. Each has separate training requirements, operational and administrative procedures, organizational structures, etc. that are confusing to EPA employees and those that have to work with EPA on a national basis. Standardizing this would	EPA does not adopt the latest technology. Computer systems (both software and hardware), like many government agencies, are years behind what is commercially available. The use of two monitors is very productive in conducting work but few are available. In fact, even a single monitor is difficult to get. Windows 10 is much more efficient with touch screens but upgrading to this technology will take years. EPA does not provide mobile phone to managers/staff (if needed) that have a need to do so, and has not standardized the hardware that will be used. Conference rooms often do not have video conference capabilities; these frequently do not work. This is especially important with the smaller and smaller budget	Environmental data in Federal Agencies and within EPA is in databases that are not linked and do not contain sufficient metadata. It is not unusual for project data to be in a drive in a project manager's desk or CD. A national database containing all environmental information would minimize repetitive sampling and analysis and permit decision-making using existing data, or identify information that is needed. The cost of creating such a database would be far outweighed by the cost of repetitive sampling and analysis. This information will also be available to our
725	724	5/8/2017	Requiring that the office director of a program needs to sign off on all correspondence adds significant delays to communicating with the regulating community, would recommend that only legally binding documents require such a high level signatory. Notices of Violation, Warning Letters and other communicative nonbinding documents could be signed by managers or project managers, compliance officers etc.	Building closer relationships and providing more training and opportunities for collaboration on enforcement of environmental laws would benefit all the agencies and the regulated community. Enforcement practices are not consistent between states and often not consistent with federal law creating an uneven and unfair playing field.	Digitizing documents and warehousing them on an FTP website would increase transparency and the ease the level of effort when the public and other stakeholders need access to information. FOIA response would be easier, quicker and less costly, if such a system were developed and put into practice.	Increasing the number of days allowed for telework would reduce costs and inefficiencies, while greatly improving the quality of life for many employees, without degrading environmental protections.	Dual or larger computer monitors would increase efficiency and save money buy eliminating unnecessary document printing. All most all modern businesses that deal with large volumes of information provide larger or dual monitors to its employees.

726	725	5/9/2017	HAPPY EMPLOYEES PRODUCE: EPA is a dysfunction agency due to lack of properly and industrially trained people/ managers. 1.Hire only industrially experienced Managers: Managers at EPA do not have subject matter expertise and never worked a day in the industries which they are controlling. Look what they did to the coal mining industries. Managers who made decision about the industries never worked a day in mines, 2. Racism in hiring and promotions: Racism a BIG FACOR in making EPA a non-productive/ dysfunctional agency. Whites particularly white females who never worked any where else to gain practical experience are promoted over non-whites who came to the EPA with industrial/ development and proper experience,.. 3. Outside search committees of University- faculty members with subject matter expertise, and with ethnically/racially diversified background should be engaged to hire and promote employees,	1.Currently EPA has hardly any contact with the states, tribes, local communities, citizens and industries. Employees are prevented from having any contact with the aforesaid. Permitting and enforcement responsibilities should be left with the aforesaid. You need insiders' help to make changes. 2. Find out who were responsible for Flint Michigan drinking water matters-----fire those manager for their inefficiency ? Why these managers still have their jobs ! These managers are criminals not environmentalists!	1.EPA managers prevents employees to provide customer service to the said. Each employees should be allowed to meet public, locals etc to have contacts with the aforesaid without managerial permission. Each employee should actively participate in professional associations and should attend town hall meetings, 2. Employees should be allowed to meet Citizens to hear their concerns--right now employees have been told to ignore citizens, 3. Fire the managers who destroyed Coal Mining Industries without authorities. Do you want names ?	1.Unless you punish managers for inefficiency, racism, neglect of citizens---nothing will change, 2.I was called as "mold" when I told that we need industrial growth, and at the same time we can protect our environment, like we can burn clean-coal (President Jimmy Carter started the movement, and later killed by President Reagan), 3. Micro-management up-down must be abolished. My manager acts like a mommy than a manager who has no expertise in subject matter. When I have NO respect for my managers/ directors--how could I be productive? 4. Ask how many people are happy with their managers? 5. Why almost all mangers are whites--why benefit of civil rights were given to the	Current technology practice at EPA is satisfactory. The problem in not technology--the problems are mangers and under qualified employees, and racism. Read the reports of the Office of Civil Rights and take remedial actions. Have direct contact the Universities to get the academic input.	1. By transferring all permitting and enforcement functions to the states, 2. Ten (10) regions should be reduced to five (5) regions, 3. There should be direct relations with industries and business like many state agencies. My manager told me not to have any contact with industries, business and citizens,.
727	726	5/9/2017	Overall, EPA management moves very slowly. It is rare to get them to take quick action and many times even when faced with disruptive employees or entire groups, they take no action at all. Within the Office of Air and Radiation there is a group in Las Vegas (the National Center for Radiation Field Operations) that has caused many problems over the past few years and has required staff from other parts of the office to come in and fix their mistakes. There is no action taken against them but in the process other productive staff have had to spend their time correcting NCRFO's mistakes. If EPA management would hold people accountable and not continue to waste money on groups that aren't producing, then the other parts of the office could use that money to produce even more than they already are. Resources are limited and we must be fiscally responsible and use the funds as effectively as possible.		I think EPA provides good customer service to these groups. I have contacts in the states who say that they need us to continue to run the programs we run. For example, in the radiation world there are Agreement States who have an agreement with NRC to assume regulatory authority under the Atomic Energy Act. These states are also operating on limited budgets and with few staff and have expressed to me that if EPA discontinues any of it's radiation protection programs then that work will not get done because the states don't have the resources to take on the extra work. In the radiation world, at least, the EPA has a good working relationship with the states.			There are parts of EPA that are duplicative and costly to the agency. In the radiation program there is a field group in Las Vegas (the National Center for Radiation Field Operations) who's cost to productivity ratio is high. They do minimal amount of field work but continue to be fully funded. In the past they have been shut down for lack of a quality system, been investigated by the IG several times, and the staff continually submit EEO complaints on each other, which requires much time from those who have to respond to the complaints. The services they provide to the Regions are minimal. Other agencies such as DOE provide similar

AMERICAN OVERSIGHT

	I
726	1. The practices at Microsoft and Google should be implemented at EPA. 2. Teleworking should be limited to 2 days/ week, 3. I have worked in industries, government and teaching and all over the world. I have never seen such a dysfunctional/ welfare agency like the EPA.. Managers make their employees unproductive as managers were selected based on race not on expertise.
727	From what I've heard, EPA's LEAN process is a good tool for looking for efficiencies within a project or program. I am about to get involved with a LEAN event so I can't say for sure if it is as good as everyone says, but this may be an example that could be built upon or expanded to more programs.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
728	727	5/9/2017	In order to get needed supplies such as pens and notepads, we need written approvals from supervisors and then have to submit requests to the mail room. This is very inefficient. Need to make it easier to get basic supplies.	State counterparts could benefit from EPA training.	EPA should make it easier to locate documents easier to find on EPA websites.	Use Energy Star only appliances.	It is difficult to sit at a desk for several hours and maintain efficiency. Incorporation of the "varidesks" in EPA offices would decrease fatigue and improve efficiencies.	See response to Q1 above. Need to provide more training opportunities for State personnel.
729	728	5/9/2017	Emergency Response: Under the previous administration, the ability for on-call emergency responders to be able to use Emergency Response vehicle to commute from home to work to have immediate access to the vehicle 24/7 to respond to an emergency was taken away. This slows response time. Solution: Allow on-call responders to again use Emergency Response vehicles to commute from home to work to have immediate access to respond immediately 24/7. Remedial Program: The process of cleaning up sites has slowed primarily because of the legal activities associated with finding PRPs and negotiating cleanup actions along with the sometime arduous process of public comment process. Solution: Stream-line the process where EPA can shorten the PRP search requirements and public participation requirements to get sites cleaned up faster. PRPs should understand that the Agency is going to clean up the sites and will go after cost	Regional Response Team: The ability of the Regional Response Team to have an industry working group as part of the organization was a benefit as EPA/USCG was able to obtain input from those companies to address response organization issues and work together with the regulated community to resolve important issues. This was taken away under the previous administration indicating that it was a conflict of interest. Solution: The ability of the Regional Response Team's to be able to have an Industry Working Group is very important.	Removal Program: The previous administration has strangled to professional emergency responders at the agency by preventing us from providing timely updates to the community by requiring us to go through external affairs prior to posting updates to our stakeholders. Solution: Restore the ability of OSCs to communicate directly with the community without the filter of the Agency Public Affair Directors. EPA Responders are professionals and typically communicate directly with politicians, media, and community verbally on a daily basis and should allow this on written communication. Its all about keeping stakeholders informed.	The Agency has reined in the use of the Government Purchase Card and made it so difficult that those that have them don't want to even use them anymore. Obviously, mistakes can be made but those that continuously make mistakes after being warned should be dealt with appropriately. This would help the agency be more efficient.	I am technology user but not a technology innovator. I know the agency has an issue with only purchasing or using portions of programs that they obtain rather than fully utilizing the power of the program. There should probably a technology person in each Branch and Division in the Regional Offices to help innovate with technology.	I think that EPA is a go to Agency for State and Local entities. I do believe that the Agency gets too involved in activities that should be done by the State Agency. EPA should be an Agency that provides support to the State for activities they don't have the expertise to perform and be a resource to them. The Agency should be hiring experienced personnel to provide that expertise. I think Regional Offices have a generally very good relationship with the State personnel but because of the politics they are forbidden to discuss. I think the Agency should be right-sizing the personnel it

730	729	5/9/2017	Lack of accountability that derives from very weak positioning with union agreements. Removing poor performing or badly behaving staff is very difficult and time-consuming. It also disrupts morale when other staff can see, but are not aware of any steps taken.		Overall, I think those parts of EPA that I have worked with provide very good customer service and interaction with state/tribal partners, as well as the public at large.	The role of the Office of Policy is questionable at the scale it currently operates. Many roles are redundant or could be rolled into corresponding program offices. While some policy should be directed for the Administrator's office, the increase in staffing over the years has been exponential and unnecessary, directly producing very little in measurable results and taking away from direct programmatic operations/needs. The appropriate offices/people should be running the technology with people who fully understand how to accomplish. I would remove the Office of Technology Solutions (OTS) from the OCFO and place it within OEI. OTS is a black	Modernize the Performance Assessment Rating System (PARS) so that it is fully electronic with a suite of standards that can be put in place. This would allow for consistency in standards (e.g., for specific jobs, like being a Project Officer) and would eliminate a lot of needless paper and time copying/sending standards and completed ratings. Most federal agencies have this done electronically now - green EPA is still doing it the old-fashioned paper generating way. Understand this was an option of our FPPS system that we chose not to purchase due to prioritization for other costs. Do a better job building in technology planning/purchasing and give	
731	730	5/9/2017	The time limits on funding are very tight, we seem to value speed of spending over quality of product delivered. Resources should be allowed to live longer to accomplish higher goals. PCs and network have room for improvement to facilitate better internal and external collaboration in research. Better ways to track progress of purchases and products being generated. Purchasing supplies with purchase credit cards is perhaps our most inefficient and time consuming process.	Increase funding to Engineering Technical Support Centers, which connect latest research with those solving problems in regions, states, tribes, communities and private sector. Much good has been done and much more could be done to resolve problems via this route. We need to increase opportunities for collaboration across the board.	Increase funding to Engineering Technical Support Centers, which connect latest research with those solving problems in regions, states, tribes, communities and private sector.	Establish a performance metric for rules and regulations, if not met in certain time period, rule or regulation self cancels and is reevaluated.	PCs and network.	Improve opportunities for interagency agreements and agreements to jointly pursue research needs with states.

732	731	5/9/2017	Reduce number of fire drills, particularly those that are driven by arbitrary media request deadlines. Prioritize "controls" so that important work is not pushed to the side to response to a second grade class that wrote a letter to the administrator. Consult with OGC to remove EPA practice of responding to every public rulemaking comment in a response-to-comments document. The law says that major comments should be addressed and this is already done in the preamble. What is the legal requirement/value of a response-to-comment document? I would argue very little.	Focus on statutory requirements: ask program offices and regions to clearly segregate activities into three buckets: what is required by statute, what is explicitly authorised by statute; what is implicitly authorised by statute (voluntary work, e.g., WaterSense, waste min programs) . Change funding so that Congress, OCFO can more clearly see resources devoted to required work vs. resources devoted to voluntary work - as long as funding is mixed together, EPA managers (career and political) have discretion to fund voluntary projects over required work.	Focus on programs implemented by EPA directly; by focusing on statutory work, EPA should be able to provide better customer service. Increase grants to states as you decrease funding for voluntary EPA programs - if you want to keep funding flat. Make an effort to prioritise projects based on risk: what exposures pose the greatest risk to the greatest number of people? This may skew efforts to air rather than Superfund/water but there may be elements of risk we are missing.	Focus on regulatory clarity (make a push to finalize all draft guidance!) and enforcement (especially at federal facilities). We have a lot of regs on the books, and we probably devote half of our resources to updating, maintaining and creating new regs while the other have goes to actually implementing the ones we have.	Focus on monitoring, remote sensing, citizen science initiatives, etc. to act as screening tools for compliance and enforcement work. Also use these tools to gather better data, rather than relaying on models. Need a robust monitoring network across all media to inform EPA's work. "Regulation through information" - motto of TRI program - could be focus of this admin.	
733	732	5/9/2017	Using the government purchase card requires more steps than seems necessary. There are paper requests to be completed and routed to at least 2 levels often 3. The purchase card approver has to sign, the office director has to sign, the forms then needs concurrence from a funding person. Once all signatures and approvals are collected the order is placed, someone other than the purchase card holder must acknowledge receipt. Once this is completed information must be entered into an web based program,PNet, which requires uploading documents the administrative burden is seemingly endless.Cut out the funding person we have a budget and the office director should be able to make these decisions.Cut out the 3rd party verifier, these are by definition micro purchases so why all of the oversight. Develop one form for record keeping and accountability. Training forms ,SF182, are too complicated and require more			Yes, our agency is overrun with poor and non functioning employees. We all know who they are and where they are. It's ridiculous that the American public is paying salaries for these people. Managers are hampered by Labor Employee Relations and bargaining unions. These reprobates are a black eye on this agency and America. Whittle down the process, reduce the documenting burden, give a strict deadline for improvement. Labor and Employee relations needs a deadline also to provide managers with what they need to fire non functioning employees. Also why the separation of performance and conduct? An employees conduct is as important as their performance. Though they may do a good job but	There are still issues with the automated time and attendance. Employees have a deadline to enter their time into the PeoplePlus time and attendance system. Managers have a deadline for approving the time entered. These deadlines are frequently missed by both entities. The OCFO and OARM are working together to initiate an upgrade to the PeoplePlus system. However the upgrade has issues. Time approvers have always had a secondary approver.. The new iteration of PeoplePlus is going to place a huge burden on several in the time entry and time approval chain by requiring someone in this chain to choose a different approver electronically when the primary approver is not available. This is risky and could lead to numerous

Involve the stakeholders in the process early on. Get their feedback via town halls early before finalization of economically significant rules. Have field trips to stakeholders.	Cost Savings Ideas ???Regulations: Have an Analytic Blueprint early in the process of the project that anticipates challenges, budget across years and has sign off from managers and project lead. ???Training: Encourage the online e-learning site and the books on the site for career advancement training. ???Promote detail assignments to help expand staff skills and experience. ???Come up with better way to transition retired staff knowledge to those remaining in the Agency. Perhaps require 1 or more months of mentoring from retiring staff to those staying at the Agency. ???Do cost efficiency analysis and continue to do LEAN analysis to find ways to		
738	737	5/9/2017	From where I sit it is the absence of an organizational structure that is preventing not just me, but EPA from operating more efficiently and effectively. EPA needs to develop a portfolio governance structure. This is a structure that would be charged with identifying, prioritizing, selecting and assigning resources to the Agency's most important performance improvement projects. The focus, actions and measures by which to evaluate and gauge this structure's efforts would be driven by the Agency's strategic objectives and administrator's priorities. To establish such a thing will not be an easy task to undertake.		Look for real duplication of efforts or apparent duplication and challenge it by asking, why. By way of example the process for approving the importing of hazardous material is ostensibly duplicative. There are three major steps to the process and two are reviews. The first review is done at HQ and the second review is done at a Region. The final determination on whether or not to consent to the request for import is made back at HQ. Now this process has not been looked at deeply to determine if there is true duplicative effort occurring, but there is enough on the surface to go digging and if it is found to eliminate it. If there is duplication and it's removed it will save time and thereby improve the customer experience in dealing with the Agency.	Hire more experienced Process Improvement personnel.

739	738	5/9/2017	Over the past several years, the burden for information reporting to EPA headquarters OEM has become burdensome. When OSCs are deployed for smaller responses, OEM requires lots of information and asks questions which influence regional management decisions sometimes harming the relationship with states. Two examples: First, OEM spot reports involve a GS-13 or GS-14 writing reports about an ERNS report the Region has already written. Often, information we have already provided to our regional stakeholders (i.e. states and tribes), is now unnecessarily duplicated. Second, OEM now requires regions to verify that downstream notification have been made under a number of circumstances. This include for any response in which an OSC has been mobilized. In many cases, the OSC may be mobilized at the request of the state for something small, however it may be unnecessary to make downstream notifications due to the amount of material released so the state may choose not to make this	We need to be more customer service focused. Our customers are states, tribes and local communities, and sometimes the private sector. When an OSC is sent to a response, he or she should be partnering with industry and the state to help minimize environmental impact, prevent breaches in law and reduce fines from the state and federal government. OSC???s don???t write tickets or fine anyone. Often we are not viewed as a threat. However, many times during an emergency response, other EPA offices or headquarters become involved and disrupt the response. Often, there are fines or additional requirements such as downstream notifications, or questions received from EPA headquarters that send the OSC on an information collection errand. This makes EPA difficult to work with. State and private sector entities have slowly	Each of our states is different. Some want EPA to be there emergency response program. Some want EPA to supplement their existing emergency response resources. Some states don???t want us there at all. We need to learn what each state wants and incorporate it into our emergency response strategy for that state. Each Regions Emergency Response program already has a relationship with each state and knows what each state wants and needs. We just need to be able to response to each state in a fashion that suits them, not in a fashion that looks consistent to OEM.	We unnecessarily increase costs by duplicating efforts in EPA Headquarters Emergency Response program or by working on projects which are unrelated to our environmental statutes. Several examples are as follows: 1) There is already an abundance of Regional Oversite. Now EPA Headquarters OEM is now providing oversite and writing reports about the reports the regions write. This is a duplication of efforts and often, many of the information request drills we get from EPA OEM increase our project costs, which sometimes end up going through cost recovery. Additionally, there are examples of EPA OEM staff attempting to charge to regional projects and accounts. 2) There is	Currently, our emergency responders do not take their vehicles home while on call. There are many examples where this has added 3 to 4 hours to our response time. These examples are often in instances where states have requested our assistance to protect human health, i.e. when there is a chemical fire near a neighborhood and residents or fire fighters are being exposed to smoke. State can???t understand why we take so long to respond. SOLUTION: Allow EPA OSCs who are on call to park their emergency response vehicles at their residence. This is common practice for other emergency response organizations.	Over the past decade we ramped up homeland security funding and spending at EPA, yet we have very little direct homeland security responsibility. In a real-world homeland security event, we would defer to FBI, Department of Homeland Security or other federal agencies and assume cleanup responsibility after they have performed their investigation and released the Site. There are numerous real-world examples where this has happened. EPA does not make homeland security decisions. We???ve given out hundreds of expensive security clearances to OSC???s and other EPA staff who do not, and never will
740	739	5/9/2017	Frankly speaking, we don't need two section chiefs (level 14) under branch director (level 15). Branch director should know well the branch business well, and most of time, the regular employees doing the work handed out from section chief. Two section chiefs cost six figures each, you would save a lot from cut them off.

739	Many organization base promotions and performance on work ethic, skills and professional standing. At EPA, these things seem to be based on seniority and personal relationships. We continuously reward the people who have hung around in a job for the longest. These are rarely the people who have the best skill set or serve the agency in the best way. There are no incentives for doing things efficiently and saving money. Because of this, many senior EPA employees make only a marginal effort to conserve resources. If I can do a project for $20,000 that a senior engineer could do for $30,000, isn???t that worth make note of. No one

741	740	5/9/2017	Eliminate the Office of Research & Development's (ORD's) Office of Administration and Research Support (OARS). This reorganization was implemented in 2009. The idea was to reduce the administrative burden by consolidating budget, human resources, travel, and contract services. Job functions were pulled from remote locations and given to others thousands of miles away leaving sites with inefficient and inadequate administrative support, and highly compensated supervisors were left with very few (~<5) direct reports. Bottom line is it proved to be nothing more than a power grab and an excuse to raise the grade of many employees. No staff positions were eliminated--only moved around on paper without a clear distinction in job functions and pay grades with the administrative burden falling on the scientific community.			Remote sites once ran like well-oiled machines, but once OARS stood up, that totally disappeared. Scientists who were once able to concentrate on science are now performing more administrative-type duties. Give remotes back their purchasing agents, travel functions (SEE employee), budget, and contract specialists. Return obligational authority to a select number of Funds Control Officers. Appears contractors have more rights and system permissions than do Feds who are more knowledgeable of what needs to be accomplished.	Reduce the number of systems that do basically the same thing or nothing at all--namely, ORD's Purchase Card System. Highly paid scientists are having to do more functions that were originally done by lesser paid administrative staff, such as placing orders and completing and revising bank card forms or purchase orders.	
742	741	5/9/2017	Place more FTE in the critical "money spending areas" such as Contracting for oversight of contractors performance, stricter compliance with contracts, less change orders, invoice approvals are performed correctly, timely closeout of contracts (ties money up). With the current staff we have nationwide, this area is getting neglected. Hire out (a Contractor) for Close-out activities if no FTE available.	Better results with Private Sector - increased emphasis on building performance based incentives and disincentives. Currently by policy only, Contracting Officers are discouraged from placing disincentives in contracts and are not trained enough to include liquidated damages (i.e. if contractor delays entire project, no remedy, just deal with it by other means). More training, more models of performance based Quality Assurance Surveillance Plans etc..	We do a good job here! We are sensitive, good listeners, and make others feel important. I see it everyday and I'm amazed at how EPA personnel will bend over backwards to help folks.	Aside from true emergencies, negotiate all work across the national contracts: Superfund Technical Assistance Response Team (START Contract) (the contract that mostly assesses the site for EPA and also, although no one will say it formally, supplements our workforce) and the Emergency Rapid Response Service (ERRS Contract), the construction contract. These contracts are HIGH dollar contracts. They are currently set-up to essentially issue what EPA (poorly trained cost estimators) estimates the costs (always high 20-30%). A not-to-exceed cost ceiling is given to the contractor to do the work. If we change that and now ask the contractor to propose their costs, I strongly believe it will	We are one of the few agencies whose financial system (called Compass) and contracts system (called EAS) are separated. The amount of lost man-hours trying to make this process work is highly inefficient. Although, this would require up front costs. You could start with making it easier for Contracting Officers to move money around within EAS. Also keep a close eye on the EAS Contractor. For every change, users go from two steps/buttons to at least 5-7 steps/buttons to accomplish same task and thus, increasing the complexity of the system, with little value to the Agency. Ask them to reduce the number of buttons for example to place an attachment in the system (currently takes 3-4!).	No response.

743	742	5/9/2017					Providing EPA employees with dual monitors would facilitate more efficient and effective review and analysis of documents and data.	
744	743	5/9/2017	We switched from WebForms to PeoplePlus for absence requests, but for individuals on a credit hours schedule, the system doesn't transfer absence requests to the timecard. I spend a ridiculous amount of time instructing staff to amend timecards to match leave slips or vice versa. I would make the system work for all types of schedules.	Hold states more accountable. We currently give states broad latitude and don't hold them accountable for high-quality work plans or for producing results in reasonable amounts of time with reasonable amounts of taxpayer money.	Increase staffing levels for Project Officers administering grants and technical assistance (especially Cooperative Agreements) to approach the levels recommended in the LMI Workload Model done by the Agency several years ago. The LMI Model suggested my group should have 47 Project Officers. I have 14. We don't have the time to both effectively administer a grant program and also provide high-quality customer service and technical support.	No. I think we are doing the best we can with the limited resources we have, and it isn't enough - our responsibilities to tribes and environmental justice communities and trust territories falls far behind.	Improve timekeeping and administrative processes and improve IGMS, so we can spend more time working and less time filing paperwork preparing to work.	Largely we cannot. Even if we could, if we were to shift away from things we were doing expecting that other agencies would pick up those same tasks, we would find that they already have plans for their own appropriations that don't include our great ideas about what else they could be doing. We have been burned on this topic several times in the past decade.
745	744	5/9/2017	Great Lakes office often does "duplication of efforts" jobs (water issues are handled in Water Division in R5 and other issues are duplicative to the Land and Chemicals Division's positions). Elimination of that office will result in savings to many unnecessary managers positions and will actually make better consistency in the similar procedures. (R5). International (Canadian) cooperation can be handled by 2 positions for International cooperation's (barely busy) in RAO, that are also outside of the Great Lakes Office.	More should be handled by regions and less from HQs - regions do understand local uniqueness better and can implement programs better than someone from HQ who has to travel and spend more $$ to become familiar with states, tribes and locals. That will eliminate extra steps of planning and assessments by HQs, that takes time from real work in regions. Simple HQs involvement could be done through web control via databases, etc. Some programs do not need HQs participation at all - will shrink the size of HQs and their huge compensations for lot of duplication and extra layers of control.	Creating volunteer consortium for each area of concern/program and working together to address it (will cover more than doing it from their individual points of interest). People like to be a part of something bigger than them alone, plus it serves as an educational bonus.	Limiting positions that are merit promotions due to years of service but absence of specialized educations. Some with only HS diploma working 20 years claim that they can be a Technical specialist is absurd. Job is done by others (educated professionals) who are assigned by managers to help/review and implement projects on behalf of the "long timers" anyway. That takes time from work assigned to professionals and makes them not happy at work (you do all work, but after years of college, repayment of educational loans and the same grades with the ones you do work for - they get no recognition and watch people they helping get awarded). Technical and scientific positions should not be	Many US Agencies and Departments have same area of interests with EPA. Sharing technical models from NOOA, DOA, DOE, Coast Guard and others can eliminate a need in similar models development. Interagency cooperation is the way of future savings and gains in efficiency. If EPA's few emergency responders need training that exists in Los Alamos Nat. Lab - it is less expensive to be train there, it should be doable.	By making one agency responsible for each need. For Example: FIFRA program could be described as "too many cooks spoil the broth" - done by EPA, Dep. of Agriculture and Departments of Health and each state in US with their multiple departments. Lots of duplication and far from perfect. Should be under one agency for better results.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
746	745	5/9/2017	It's hard to feel motivated when your very existence is challenged. I have worked for EPA for 30 years. I was hired during the Reagan administration and I have never felt so attacked.	I think there are many under served communities where industries park there pollution machines because they know that no one is paying attention.	Information feeds and informs customers and communities - the more information the Agency shares about resources better. Secrets and dishonesty kills.	Youth is the future. Many young people are interested in protecting Human Health and the Environment but we seem to have limited opportunities for them to get involved.	We have been too focused on survival to entertain new technologies. Advancements is technology use and applications often come when employees feel motivated and not terrified.	This administration only seems interested in destroying our interest and mission.
747	746	5/9/2017	FPPS and Sunflower are two systems that are very difficult to navigate and inefficient. Both these systems need significant improvements to be more user friendly.				Better technology. Computers are not efficient and don't have enough computing power to get most of our data intensive analyses. Current computer contracts make it difficult to purchase additional desktop machines when more computing power is needed, but at intermittent times.	
748	747	5/9/2017	Too many layers in management. In my office, things get bogged in the management chain often and as a trend there's not been accountability to correct this. Also, the lack of effective management. Correction is to install effective leaders and managers.	No comment.	We can provide better customer service at large by listening to our customers, understanding relevant regulations, providing a timely response that's in line with regulations while having a culture of government that supports the health and welfare of the people and encourages business growth and development.	Absolutely! Continuing a VERA/VSIP for employees in FY2018 to encourage transitions and allow for faster and deeper restructuring of the Agency.	Someone should be actively exploring, analyzing and adjusting the Feds approach to utilizing appropriate, productive, effective enterprise technologies.	Without rich awareness of other Agency's responsibilities, I recommend loose consolidation of duplicative functions, like travel, time card management, supply ordering, etc. where a phone call is made to a customer service center to complete these tasks and employees could focus more on mission critical work. Our successful modeling of this could be mirrored, as appropriate in the States, likewise, if a state is successful at this now, the Feds should mirror this process that's being done in the States.

AMERICAN OVERSIGHT

	I
746	EPA use to be one of the 10 ten federal agencies to work for. Since that is no longer the case I guess we could start by building morale and trust.
747	
748	no comment

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
749	748	5/9/2017				At EPA we have a habit of duplicating services. Everyone is expected to produce, travel, PR even when it is only done one or twice a year. This is a major loss of time, since doing a travel or PR once or twice a year, has a major learning curve every time you do the task.		OEI went though a reorganization at the end of the last administration that took functions in one office, and split then in into 2 or more offices. The reorganization should be cancelled in an effort to save funds. and streamline OEI. With the new additional offices each is duplicating services, budget, timekeepers, SES and additional supervisors. Also, OEI is expecting to spend 1 0f thousands of dollars to move people even though most employees work out of the office 2 days a week and have at least once compressed day.
750	749	5/9/2017	It can take almost a year to hire someone from outside of the Agency, from the time the approving official signs off on the hiring action to the time the new employee can begin work. Currently HR tracks time-to-hire, but does not include this entire time period in their metric. We should look at how long each step is taking within that time and streamline each step. It is not this bad at other federal agencies so OPM rules cannot be wholly responsible for the problem. We are losing good candidates during the security clearance step especially given how long it can take. Every single time an employee wants to take training, a form must be filled out and then sent to a single person in OARM. I am not aware they collect data for any purpose or review forms for any reason. This is an unnecessary bottleneck that prevents employees from taking advantage of last-minute training opportunities and wastes resources.	We could do a better job of listening to the public and communities about their needs and prioritizing their needs. At a minimum, we should have a website where the public can communicate their needs to the agency.	We need one-stop shopping for each customer base. A State should be able to talk to one person about all of their pending approvals. An industry person should be able to learn about all of the requirements they must meet in one place.		Currently when you call EZTech for help with a computer hardware or software issue, a ticket is created. That ticket is ???closed??Â at the end of the interaction whether or not your problem was resolved, and the contractor can count that interaction as a success. The performance metrics for computer support should track not just whether a ticket is closed, but also whether a problem was resolved in the employee???s opinion. Otherwise there is no incentive for persistence in solving difficult problems. For employees who travel or work in the field, ipads can be invaluable ??? but we have to let them on our network. Otherwise employees waste time	We should evaluate the overlap of OSRE, OFA and Superfund and consolidate efforts. We should evaluate the overlap of OHS and OLEM's emergency response work and consolidate efforts.

AMERICAN OVERSIGHT

749	
750	The IT available to GSA employees (hardware and software) is far superior to that at EPA, and may even be delivered at a lower cost. It allows employees to do their jobs more effectively and efficiently. Could we just buy in to whatever contract they use?

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
751	750	5/9/2017	At this point, I think we have the opposite problem: People are acting as if we are essentially on auto-pilot because the Executive branch is managing neither the budget nor people's time. Contracts using FY2016 funds have finally been issued, so people are starting to spend FY2017 to achieve objectives that seem to have been defined by the last administration. Reasonable people and cooler heads seem to have relatively little influence at the staff level. There are modest Bush-era ideas and programs that could be resurrected, but instead we persist with Obama-era policies because the new Administration has made no effort to engage people, and staff are afraid to speak up because the new administration will just kill their program.	There are a lot of people at EPA with environmental expertise to assist many programs. If you want to downsize certain offices, you might want to let some of the EPA employees at those offices seek out other offices--and take their slot with them. For example, if the climate program is downsized, why demoralize the staff which will cause them to be unproductive and waste resources? Instead, empower them to find other offices where their skills are valued, take their slots, and get something useful done? (The slot could revert to the original office or vanish when they leave the agency.)		The phased-retirement program defined by statute and OPM regulations is not being effectively implemented by EPA, whose HR department has chosen to follow a narrow interpretation of the program so as to ensure that it is not used by anyone who was not about to retire anyway. If broadly construed, the OPM regulations would allow anyone eligible for retirement, to convert to half-time until they are ready to retire. That would free up many FTE's as there are people who would like to start up businesses or move to a new field but stay with EPA half time until the new activity is up and running . That is, phased retirement could be structured so as to encourage people who		In the climate change area, the first step is that the new management of EPA needs to engage everybody to try to learn what staff might be able to do consistent with Administration preferences. There are lots of Bush-era activities in OAR that were cancelled under Obama that could be reasonably resurrected, if management solicited such ideas. The French political term "cohabitation" comes to mind. Perhaps you did not wish to have a staff of climate-change analysts, but you have one. Why not engage them to see what they can do that--from your perspective--will seem the most constructive.
752	751	5/9/2017	Well, actually, I have found that the major employee cuts and loss of administrative staff positions in favor of requiring employees to book their own travel on Concur (or the program of the day) or do all of their own paralegal tasks like setting up and managing litigation holds or document management that have been done based on supposed cost savings and efficiency have actually made these tasks MORE time intensive and inefficient. Given that I make considerably more than the travel agents, legal assistants, and paralegals we used to have (and that DOJ still uses), I remain convinced that this is actually costing the agency more money in terms of how my time is spent than it did when we had more administrative staff. For example, every time I have to use Concur, I am basically starting from scratch because I only travel intermittently. It is a horrible program that everyone hates and as a result it takes me considerably more time to book a trip and then to file all the	Personally, I have found that we have very good relationships with the States as we routinely consult them early on and try to encourage their participation in our negotiations. I have no experience with Tribes on this, but if we are not already doing this, we should. I do think we do not do enough to involve local community groups in our enforcement and compliance work unless they have either filed a complaint or otherwise reach out to us on cases they find out about, and I do think we would be well served to have one of the steps of our early enforcement process to look into involving local government or community groups. As for the private sector, we would do well to revive the New Owner Audit Initiative, which waived gravity penalty for any company coming in to do a	I think our advocacy commissions do a pretty good job of this and I would keep and enhance them with more publication and outreach about their existence as well as doing more to incorporate their recommendations into our work.	Frankly, we have had so many cuts over the last 12 years that we are becoming inefficient for lack of personnel to do our jobs faster and environmental protection has, in my opinion, suffered because of it. We especially need more inspectors and more technical staff and we need whole teams of employees to handle all of our FOIA requests, as they significantly overwhelm our existing staff and prevent us from doing work to ensure environmental protection.	I do think we are already doing much of this in the compliance and enforcement context under the Next Gen program, but we lack major data storage and enhanced web capacity to help store, process, and publicly publish the data we receive so that they can hold us and the regulated community accountable. This is across all programs. I do think the major updates to ISIS and ECHO have been major steps forward.	As I understand it, we already have several inter-agency working groups by issue on this. I would continue to let them do their jobs rather than reinvent the wheel on this.

AMERICAN OVERSIGHT

	I
751	1. There need to be suggestion boxes at several levels of hierarchy--your level, the AA level, and the division level. 2. The Administrator must interact with EPA employees a lot more. It's really weird that he goes out and talks to workers of regulated industries but not his own employees. 3. I have never heard of a good corporate CEO who decided that because he wants to spin off a division, he will stop managing it for the next year and just let it bleed resources. But that is what you are doing. Resources are being wasted because FY16-17 and FY17-18 funds are being spent to carry out missions defined during the last administration which this Administration may well
752	Personally, we should align our CMS system with DOJ's so that we are able to pull documents at any time without having to have each individual working on a document pull their files. This should not be SharePoint based as SharePoint is a ridiculously inefficient system in my opinion. It also needs to be automated the way DOJ's system is so that you essentially have to take extra steps to create a document that is not automatically numbered and organized by case. This is long overdue, but every attempt to institute a CMS at EPA has been massively bungled and half-hearted. This would also make responding to FOIA requests far easier and may even allow it to be handled

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
753	752	5/9/2017	HR is short staffed and remote. Employees have to waste a lot of time trying to contact HR, waiting for HR to complete basic tasks, and following up when basic tasks are not completed. Ideally we would have local HR staff who are able to respond efficiently and effectively to our operational needs. Even if we can't have local HR staff, it would be helpful to have more HR staff so there is not such a backlog in the HR offices.		We are able to understand the needs of states and tribes, build better relationships, and provide better customer service when we are able to meet in person. Reducing restrictions on travel would allow us to meet in person and provide better customer service to states, tribes, local communities, and regulated parties.		Responding to FOIA requests is highly inefficient. With better software we could save large amounts of time and money on FOIA response. Specifically: - We need an up to date and fully functional version of Relativity (the current version has several limitations including: it does not deduplicate documents or identify email threads, the current version contains sorting and search features that can only be used by eDiscovery and not by EPA users, and the current version has limited capacity for redacting documents) - We need a searchable version of Microsoft Office (the search function on the current version is unreliable so employees cannot search their own email) - We need software that will	
754	753	5/9/2017	In my opinion there is nothing preventing or prohibiting an employee from doing their job efficiently and effectively. In my time at EPA I have experienced miss-management, a lack of integrity by management, a lack of fiscal responsibility, and many other issues that have been made public by media, the public, the courts, and the legislature. So everyone knows what the issues are however the challenge has been how do we go from business as usual to breakthrough. I would recommend that leadership read the following article and apply it. Change starts at the top. https://hbr.org/2016/03/the-most-important-leadership-competencies-according-to-leaders-around-the-world	I have had very effective relationships with all stakeholders. The key to those relationships have been 1) clearly articulating the purpose, 2) ensuring that all critical parties are at the table and have all the information, 3) the location of the communication is neutral, 4) the tone of the conversations (orally or written) are appropriate and solution driven, 5) the timing of the conversations and engagement are good, and 6) the one always follows up on commitment and show appreciation. I believe whatever the topic is (science, law, or policy) results can be achieved using this steps I stated above.	early, often, and honest engagement.	Yes. I think there are many EPA employees that would be willing to step forward and make changes. However, one must start at the leadership and make them lead/manage.

755	754	5/9/2017	Although the PeoplePlus system has improved recently, it still needs many additional improvements to functions smoothly. For example, if one of my staff need to change their leave request that I have already approved, they need to send me an e-mail and then I need to go search for it in the system. The system should have a built-in function for staff to request an approved leave request be returned for modification/cancelation.	As a manager of a regional program, I continue to see the need for improved information systems and information exchange with our partners as key to getting better environmental results while reducing cost. Unfortunately, the hurdles at OEI are huge and there is little support for program staff to develop and improve systems. OEI and the IT staff in the agency appear to see their role as gatekeepers to assure everything meets info security policies, and they provide minimal support to programs needing to develop better systems to improve their capabilities. I think we need to focus future hiring on well rounded individuals with strong quantitative skills that can help improve systems. I also think we need to hire better contractors with specialized skills	This requires a cultural shift. We need to be less prescriptive when the issue only have localized impact . . . stay within regulatory boundaries. Issues such as brownfields sites, superfund site, RCRA sites typically only have localized impact, so EPA should look at ourselves as supporting the state, tribe (if applicable) and/or local community. State and local environmental programs have evolved tremendously in the past 40 years, and we need to defer to State/Local/Tribal programs and policies on localized issues and support these programs technically and financially. However, if the environmental issue has cross regulatory border issues, then there is a greater role for EPA to assure minimum standards are met, and assure local values are considered.	I have worked at EPA a long time. When I started at EPA, there seemed to be more people coming into work on a Saturday than the number of people now coming in on a Friday. The expansion of the alternative work schedule, flexiplace, and travel comp time policies have definitely made managing staff and maintaining a cohesive team more difficult. Much of the work we do in the agency is not tremendously measureable, so the increased flexibility has definitely enabled the poor performers to get away with doing even less.	Much better use of information technology tools. We have invested in software such as SharePoint, but very few people have learned how to use the tools we have in our tool chest.	I think we could work more with Agencies like the Army Corp of Engineers. For example, the EPA contracting bureaucracy is not great. The Corp does a lot of contracting. I think EPA could form stronger partnerships with the Corp.
756	755	5/9/2017	Currently the most inefficient thing my staff and I are having to do is get "pre-clearance" screening from new Administration for routine work such as proposing approval of SIP actions and proposing permit actions. This process has caused 2-4 week delays in routine business. We need to get back to the EPA's existing delegations and allow the Regions to process the routine work they do without micro-management. We know how to flag major issues or keep the new Administration in the loop if they high level issues of concern that they want to be consulted on. We are professionals.	EPA staff already works extremely well with States and industry especially when "political agendas" are minimized or there if there are no significant differences in "rule of law" interpretations. Often the biggest obstacle we face is resolution on "rule of law" issues....sometimes this means we and the State agree and industry disagrees; sometimes we and a State disagree. The States and industry are not always right, and EPA is not always right.....its simply a fact of doing business. We've even had State environmental staff and managers ask us to disapprove their work so that they can get a better environmental result where they believe politics sideswiped the permit development or rulemaking process. Best idea is keep politics and political agendas outside the regulatory and permitting arena....including	Stop fabricating the notion that this is a major issue is my main input. I do believe the Agency can do more upfront work with stakeholders when rules or rulemaking changes are deemed necessary. Probably one of the biggest complaints we routinely face is tied to our commitment to work with States where we believe they should have the first opportunity to address citizen complaints. Many citizens complain to EPA about the States' unresponsiveness to their complaints and come to EPA as a 'last" resort hoping EPA will step in. States have to be just as committed to resolving and investigating citizen complaints, or to carrying out the roles their responsible to implementing based on Federal authorizations/approvals.	Move EPA's entire record management system from hardcopy to electronic file maintenance. Too many times individual program offices have to create their own "quasi" electronic file maintenance or recordkeeping system in lieu of generating paper records. Moving the Agency to electronic files would assist in cutting down on our time to process FOIAs as well.....the problem has always been budgetary funding for this movement. We're in the dark ages with respect to electronic records. Everything should be done electronically.....permits, SIP submittal and processing, grants, FOIAs, upload portals for States to send information to EPA, etc..	Its not so much new technology, but using what's available and funding the use. Use of SharePoint to maximum extent by staff and management for file sharing/work reviews. Use PKI digital signature process. Full digitize document management and make searchable for staff. Electronic file management system.	This is not an issue.....this is a very "fake" and "fabricated" issue. We already do this extremely well....its just that disagreements get media attention. Most good news stories go unreported.

AMERICAN OVERSIGHT

	I
755	I think it all comes down to leadership, setting expectations, and acknowledging accomplishments. Leaders need to lead by example. Teams with good leaders are more likely to be productive and engaged. Leaders need to know what people down in the trenches are doing. In high school, I had an administrative job in a publishing company of about 150 people. The president of the company routinely walked around and checked in on the work people were doing. He even chatted briefly with me on occasion. Leadership in my region is ok, but is somewhat out of touch. IMO, HQ management not adequately in touch with
756	EPA Region 6 Air Program has moved to electronic concurrence of SIPs and permits, and digital PKI signature of SIP documents. This has cut our wait time to publish proposed actions on SIPs in the Federal Register. We have also move to electronic public notice platform of proposed permits where we are the primary permitting authority.....this was an effort worked on jointly by R.6 and other Regions. We rarely have to pay for newspaper public notices at this point which saves EPA and taxpayers money for publication costs.

757	756	5/9/2017	lack of interoperability between People Plus, webforms and the continued use of LotusNotes for certain tasks.	Creating more of a culture where we (EPA) insist that states and tribes perform duties within their own mandate rather than run to EPA whenever their particular jurisdiction isn't financially or technically capable of implementing their own programs.	see answer to Q.2	Reduce feel good programs, focus on the core business. Get serious about a system that tracks employee workweek/accountability.		
758	757	5/9/2017	lack of interoperability between People Plus, webforms and the continued use of LotusNotes for certain tasks.	Creating more of a culture where we (EPA) insist that states and tribes perform duties within their own mandate rather than run to EPA whenever their particular jurisdiction isn't financially or technically capable of implementing their own programs.	see answer to Q.2	Reduce feel good programs, focus on the core business. Get serious about a system that tracks employee workweek/accountability.		
759	758	5/9/2017	The sheer number of annual mandatory electronic training requirements has become ridiculous. If you multiply that number across the Agency and across government in general, the amount of wasted employee time is enormous. Things like ethics training, travel card training, tribal training, hatch act training, computer security training, etc. It does NOT all need to be annual. We are either bound by ethics regs or we are not, and if someone breaks them, they should be held accountable. Additionally, our electronic systems such as Concur, People Plus, FPPS (for personnel), etc. are purportedly to make things more efficient. I believe most individuals would tell you things are much less efficient than if we went back to the stone ages of paper signatures. In addition to being burdensome, they are designed with the end user (let's say a travel accounting person) in mind, with the user (traveler) interface not at all user friendly, and often counterintuitive. This is exacerbated by then centralizing functions so that there is no longer a	Stop all the rhetoric on both sides. Industry is not evil and environmentalists are not delusional tree huggers. We need everyone in the room.		Our legal resources (OGC, OECA and Regional Counsels) have been set up with leadership that knows the law, but has never been asked to or trained to manage. Therefore, while a legal manager could talk the ins and outs of the clean air act with you ad nauseum, they have no idea how to run an office, work with internal or external customers, motivate employees, manage work flow, etc. Additionally, the norm has become that they no longer see themselves as advisors, but rather instructors/final decision makers. I would strongly suggest placing individuals high in these management chains with some level of management experience (maybe someone with an MBA or MPA) to help them		Be careful here. We took the FPPS system from another agency so they could run some of it for us, and it is horrific. We 'centralized' the personnel functions into the abject failure that we call the shared service centers. I can attest to the fact that managers are spending (wasting) two and three times the hours trying to get a single thing accomplished through a shared service center than it ever took before.

760	759	5/9/2017	1. Go back to having timecards due AFTER the pay period has ended, with supervisor approval on Monday. Years ago, when we went from paper cards to online submittal and changed to timecards being approved on Monday, it was a great change which was touted as allowing us to dramatically reduce the number of correction cards (and was just plain more logical and practical). When we switched payroll processors awhile ago, the Agency went back to having timecards due before the pay period has ended, which causes me to have to submit (and my supervisor to approve) correction timecards for hours worked on Friday, which also leads to my leave or credit hour balances not being accurate. The last change also led to us being paid on Fridays, even though the official pay date is still the following Tuesday. If going back to approving time on Monday would cause us to get paid on our actual pay date instead of three days early, I don't see have that would be a problem.					
761	760	5/9/2017	The Response Action Frame work contracting process adds an unnecessary burden to the project managers, reduces our flexibility to fund work as priorities arise, and minimizes the number of sites each project manager can oversee at a given time. If it is possible, this program should be scrapped or adjusted to ensure maximum flexibility.	Encourage more interagency meetings and conferences so we get to know the stakeholders and understand their needs and capitalize on their expertise and proposed solutions.	More funding for community outreach work. There should be money directly allocated for Community involvement work instead of apportioned by the region from the general Superfund Budget.		IPADS and IPhones for work.

762	761	5/9/2017	Administrative requirements seem to be burdensome in general, but they also ensure there???s a minimal amount of impropriety while maintaining accountability and fairness. Impartiality, public trust and equal voice all come with some overhead. That said, telework (although convenient for my family) needs to be revisited and pared back because trying to coordinate without meetings and virtually isn???t working as well as being in the office.	At the HQ level there seems to be very little interaction with states - this seems to occur predominately at the EPA regional level. The local communities (e.g. watch groups, water utilities, etc.) and private sector (via associations, e.g. AWWA), seem to have more interaction at the EPA HQ level. Individuals who get recognition and awards from states and associations should get bonuses or promotions (or at least be able to keep their jobs).	EPA used to have published ???Rules of Customer Service??Â. These need to be reincorporated, e.g. ???Return all phone calls by the next business day. Respond to all email within 2-3 business days. Respond to all written inquiries within 5-10 business days. Use proper titles and greetings. Use professional looking profile pictures while in business attire or none at all. etc.??Â	Contract out more IT services, for cloud computing for networking, storage and application services. E.g., move it from RTP and OEI to e.g. Seattle and Microsoft. More use of video conferencing when teleworking. Foster more robust dialog with industry and associations. It???d also be nice to see prisoners / corrections & communities cleaning up not just roadsides, but more along rail tracks and water ways ??? especially in the winter when missing vegetation & foliage makes everything unsightly. A national ???clean up your community day??? is needed, or if existing, it needs to be promoted better.	There is a race to be smart. Smart water, smart power, smart lighting, smart cities, smart cars, etc. Leverage data analytics, sensor technology and advanced metering (infrastructure) at the state and local levels to inform regulations, promote conservation and increase resiliency, e.g. for drinking water, air monitoring, farm runoff, etc. Also, GIS data with time and date stamps is under analyzed in almost every aspect of society (in my opinion).	Rotate staff to attend interagency meetings, and allow more staff to participate & co-chair working groups. Assign HQ staff to coordinate w/ specific regions AND specific states. Create more MOUs, MOAs, and IAGs with other departments and agencies. Formally rotate staff amongst more and other D/A for developmental career assignments at the HQ and regional levels.
763	762	5/9/2017	Some documents require up to 7 people to concur before it is signed. This could be reduced to 4 concurrences and not affect the quality of the document and would greatly speed up the process of doing our jobs.	Our regional office works directly with our stakeholders (state, local, tribes, and the private sector). We have asked them how we can assist them and have implemented those suggestions. Our state and local partners also ask for money, but with years of cut backs, we don't have any grant money to give them. Our state and local partners don't have the employees or funds to take on our program under delegation. They rely on us to enforcement the regulations.	We let them tell us what they need from us. We meet regularly with our partners and try to implement the ideas they provide to us. We have an open line of communication with them.	Yes, move people from Headquarters out to the regions. Headquarters is detached from our state, local, tribal, and private sector partners. The regions are the boots on the ground. There have been many times that a Headquarters person will ask us the put together a report and then mention it is on their PARS to get it done. They aren't doing the work. It's like they are making up things for us to do to justify their existence. I have known people who have done details at Headquarters and they confirmed that the number of employees there could be drastically reduced and it wouldn't impact the work EPA does at all. Many times, they pull or put together reports that are not accurate. The regions then have to spend time to figure	Please institute an electronic records keeping system. We have a way to preserve emails. Our records center takes hardcopy files. So, if a facility emails a lengthy report to me, I have to print it out to send it to the records center for preservation. They will take cd/dvd but prefer not to. Superfund has an electronic records keeping system. Can we expand it or some version of it to other programs?	We don't have any other federal agencies or states that do what my program does. The states, locals, and tribes don't have the people or money to take on delegation of the program. They have also expressed to us that they don't have any interest in doing so.

764	763	5/9/2017	The process to make changes to the official Agency Financial System, Compass, or any system governed by OCFO's OTS is very inefficient. A ticket must be completed and if considered a system change instead of a bug, then another form must be prepared by the user. The change then goes through three separate committees to prioritize the change. Any committee can reject the change. Changes that are rejected will then rotate to the bottom of the list and the cycle will begin again. It seems more items are added yet little gets completed. If the issue actually makes it through the committees, it is then put on the developer's "to do" list. Sometimes it takes the developer less than two or three hours to make the change, yet it has taken months even years to get to that point.. Many employees have attempted to address concerns by complaining on various surveys, yet the process remains the same. We are told to do more with less, yet system changes that will make our jobs more efficient will take years, if					
765	764	5/9/2017	Having GS15s and 14s responsible for being Contract Officer Representatives or Project Officers. This responsibility should be a centralized function in each program office at the GS 11-13 level.	By funding partnerships instead of making them "other duties as assigned". Train program and project managers in developing partnership, EPA/State agreements, Inter-agency agreements, etc.	By seeking their feedback on the value and impact of our programs and project deliverables. Agreeing on strategic goals and objectives and then monitoring and measuring results in attaining them.	YES! Make buy-outs and early-outs available to all who are eligible and volunteer to take one. Buy-outs in the past have been restricted to specific job series. Why keep people working who voluntarily want to leave the Agency?	Yes; MS 10; SharePoint; more training on how to use EPA Cloud.	Task WH OSTP and NSC with preparing annual budget request memos so that research planning and budget processes are integrated instead of stove-piped as they are now.

AMERICAN OVERSIGHT

766	765	5/9/2017				I think the ethanol mandate should be cancelled. Including ethanol in gasoline reduces the efficiency (mpg) of internal combustion engines. E85 gets only ~70% of the mileage that pure gasoline gets. It diverts corn for food to use in gasoline increasing the cost of food. It requires more energy to produce than does petroleum.		
767	766	5/9/2017	1) In business timing is critical and it has been my hope for many years that Government would learn this simple lesson. Seems the way to 'fix' it is to continue to spend money rather than become efficient. Currently, the EPA Superfund program is undergoing a revamp of its contracting mechanisms due to former leadership that transferred to EPA Contracting from DOE then decided that we needed to 'fix' our contracting to be like that at DOE (if you take a look at our ethics or contracting training you will note that one, if not the largest cases of fraud and abuse ever prosecuted was through the DOE/USACE, Mr. Khan). The switch in contracting cost more as you have to pay money to build another type of contract and in this case train EPA project managers to now do more tasks that are of a contracting nature and not the actual 'cleanup' however a 'easy way out' is to utilize the USACE (for an overhead price and loss of some Site control issues and being vulnerable to the same type of scenario that Mr. Khan	Many times it comes down to EPA not saying simply there is no zero as a cleanup standard. States will demand you reach a cleanup goal for a contaminant that is lower than the federal level or they will not "sign off" on Site closure and thus take over Operations and Monitoring of a Site per agreements. Interestingly enough when the State is working on a non-NPL cleanup or has the Site lead for a NPL cleanup, they will waive for a higher standard for the same contaminant (EPA should be documenting these instances and using them in negotiations.... If it is good enough for a State cleanup or State led cleanup, why isn't it good enough for a EPA led cleanup). Note: EPA tends to pay for the State Superfund (other programs too) oversight personnel via agreements so that might present a bit of the reason for continuing to prolong sites.	IF provided budget then we can do work and provided that budget is in the provided in the Winter we can get better prices and accomplish more. In addition, we can gain more confidence from all parties as we can include them in planning (not just at the last minute for a project that may not happen because budget is late) and be able to notify the public in advance about what we plan to do rather the last minute because we finally got money and no just what projects of the list of things we can actually have budget to complete (last thing you want to do is tell the public all the design you have planned as you may not get any money to do work or enough money to get all the work done and that promotes a poor view of EPA and the State).	Besides those previously listed. You want to reduce personnel, okay. Find the portions of the Agency that have a finite work assignment and complete the task as when the job is done, the worker needs to find another job or retire. An Example: Take the worst Sites in the Country and clean them up and thus the need for personnel to do the job is no longer there. One does not backfill a job that is complete. Find the Sites that can be completed for the lowest dollar and start there and keep moving until you run out of Sites. As Sites are completed then you can use more of that budget to accelerate completion of the next level of Sites.	Apple. No desk phone and no desk computer.... everything mobile and synced (calendar on phone auto loads to your laptop and vice-versa... boss or any party can text you or send a calendar invite and it is on all your devices). Face-time for webinar/training/meetings. Having lots of tech and that tech not being compatible from device to device is an issue and you have less issues with the Apple operating system and virus problems. Want less Enforcement and keep a clean environment? Be where your customers are and help them with compliance and that means mobile tech (you can face time your supervisor if you need) but there is no replacement for being where the work is located.	Co-location of personnel into offices located near the State Government counter-parts. Example: I work in the Helena, Montana Office and my primary Site work is located 18 miles from the office (3.5 hours max travel distance to my other two Sites of responsibility), approximately 4 miles to my State counter-parts, and I work often with the Lewis & Clark County and the USFS both are located within 10 miles of this location. Don't want an EPA office here? Okay, co-locate me with the USFS for 3 days a week and Telecommute (work from home) 2 days a week (keep a local IT person though to service the staff you maintain in

768	767	5/9/2017	the only one that takes more time than it should it timekeeping. We are still working with 3 systems at R7	Continue to foreground collaborative partnerships where all actors are engaged and grapple together with tradeoffs for their community, and creating solutions collaboratively. The urban waters program is one such example.	Develop a cadre of highly skilled community engagement specialists who understand can implement the most collaborative end of the range of public engagement, including alternative dispute resolution and mediation. WIth the feds, states and tribes, the regulated community, and the public working together, so much more can be accomplished that actually works. However, it takes a commitment of people resources to do it right. Not a quick fix, and not partisan.	Fix the timekeeping system and rules for paper records and get our VPN more up to speed so we don't lose time when we are mobile. Add telecommuting to the list of allowable alternative work locations so that passenger vehicle and public transport time can be put to good use.	It's called google, gmail, dropbox, evernote. Please give us back our access to what works.	use the federal partnership model as a regular thing rather than an experiement. There are several to use as models, including urban waters. However, they can't be voluntary and need accountability to be built in, otherwise they become optional.
769	768	5/9/2017						Marine Corps Base Camp Lejeune in Jacksonville, NC has an Environmental Division which monitors and assesses the impact on the local environment due to base operations. It would be great for the US EPA to partner with the base so both could share their perspectives and experiences to lessen the bases' environmental footprint.
770	769	5/9/2017	There are several small offices within my AAship (OLEM) that have Divisions of 4 or 5 people. The general understanding is that Division Directors are supposed to supervise at least 15 people. There are currently three Division Directors in our office of 26, with 5 direct reports to the Office Director.	We should make sure that funding to sates, tribes, and communities are not cut. Many states rely on EPA funding to staff their environmental departments. Cleanup programs should be funded at adequate levels, because local governments and tribes often do not have the necessary resources to cleanup contamination, protecting their citizens from dangerous pollution.		I think that we should continue to pursue our policy of not fining companies that voluntarily acknowledge a spill or audit irregularity. By volunteering information such as that, they are reducing the amount of work on the Agency and are also proactively being good corporate citizens by protecting the environment and human health, not to mention avoiding fines that they would incur by not notifying us. We should publicize these companies when they do this.		

AMERICAN OVERSIGHT

	I
768	Already stated - better public engagement. The standards are set by the International Association of Public Participation and the National Coalition for Dialogue and Deliberation. Look at their spectrum of public engagement. It will not shock you that most government engagement is traditional and does not create solid lasting, collaborative solutions.
769	
770	Many state agencies allow inspectors to use electronic forms that are instantly transmitted to their offices. Not being in a program that does this, I'm not sure how common it is in the Agency.

771	770	5/9/2017	Reduce the constant pressure in ORD and NERL to put out peer-reviewed scientific publications in prestigious journals at the expense of providing assistance and support to states and / or completing congressionally mandated work. The EPA should not be a place for scientists to advance their personal careers and agendas by pushing out publications. Although publications are important for maintaining the EPA's scientific credibility and expertise, it should not come at the expense of supporting the agency and it's clients (states, local communities, private sector, etc.). There are managers at various levels in ORD and NERL who push scientific publications, evaluate employees / divisions based on publication counts, or focus almost entirely on publication statistics (number of citations, peer-reviewed publications per FTE). This creates an environment that punishes the scientists who focus on performing congressionally mandated tasks, advancing the mission of the organization, or providing	We already do a lot to provide support for the states and local communities. In particular, the EPA provides a centralized scientific and technical resource to assist states and communities in dealing with pressing environmental issues, responding to environmental disasters, and assisting states and the private sector with following the regulations in an efficient, cost-effective manner. EPA (particularly the science) should refocus on how to better provide support to clients and stakeholders. We also provide a repository of methods, instruments, and expertise that is available to states to support them, and we have actively been involved in states that have asked for our support. We need to better advertise the EPA (particularly the scientists) as a resource available to assist	See Q2.	Reduce the dependency on contractors - while it is important to have some contract support for critical tasks, contractors should not be substituting for federal employees. Federal employees should use contractors to support their work or provide expertise not otherwise available, not to do their work for them. Federal employees should pull more of the weight themselves rather than having expensive contractors do it. Streamline the purchasing process. In some cases, purchase requests take months (or longer) to process, and by the time they are processed the needs change or the items are no longer required. Focus on making it easier for	We should have a centralized IT system (with a single sign in) responsible for all the subsystems. Having to deal with multiple different subsystems (Lotus Notes, People Plus, SharePoint, Concur, etc. etc.) that all use different credentials. Make it easier for EPA researchers to communicate publically about their work. Although it is important that all communications be reviewed, we should be encouraging EPA researchers to share their work with the public. After all, taxpayer dollars are going to support the EPA research, the taxpayers should know what the EPA is doing with that money. This will also help to garner support for the EPA (provided the work being done is actually worthwhile).	For ORD (or individual laboratories), focus on one or two key research areas important to public health and focus on those. Try to stick to congressionally mandated areas of research (i.e. Clean Air Act, Clean Water Act, etc.). Research that does not support one of these key areas should be considered very carefully. Right now we are spread too thin, in too many different directions. We need to refocus on key areas and assess what the needs are in those areas, and then focus on what we need to do to meet those needs well. We also need to foster collaboration, both within the agency,
772	771	5/9/2017	Offices are more interested in spending the funds they have and in maintaining those levels of funds, not to "lose" them, than in saving money to the American People. Managers openly ask or order to spend the money as quickly as possible, even if we don't need those services. Managers promoted based on love for our country, knowledge, skills, abilities, and consciousness about the large government debt, instead of aptitude to "manage by fear" would solve this and many other problems. There is no way to produce effectively in this environment.	I believe Administrator Pruitt is right on target: Why do we maintain this inflated sense about ourselves thinking that we know better than all states, and that states cares less about their environments than us? We should send as many programs as possible to states, local communities, and tribes to be managed by the people that are actually knowing what is going on first-hand. Private sector will also be more dispersed all over the country promoting economic growth, job creation, and innovation, instead of all being concentrated in Washington, DC	Attitude and transparency are key. We need to stop "talking down" to them. They stop listening as soon as we adopt that arrogant attitude that they need to learn, when in reality it is us that need to learn from them. Being more humble and more understanding and again, delegating a lot of the work we do to them will improve their environment and will reduce waste, fraud, and abuse.	I strongly support putting America first, and stop sending money to countries that keep polluting and financing international organizations as the UNFCCC that has a large number of "scientists" who only dedicate to travel all over the world adding nothing to knowledge on climate change and other issues, actually distorting the truth, and paying their lavish lives with the American worker taxes. When it comes to enforcement, let's start by focusing only on what is purely about environmental protection. EPA became too political, too abusive, and that shrank the economy and reduce our capacity to protect the environment. Let's bring back costs to our analysis, and let's stop	I worked with the Department of Energy and private sector in promoting American environmental technology. Americans were at great disadvantage because it took years in getting approval, energy stars, avoiding penalties, and so on before being able to promote, and commercialize our innovative technology. China, Japan, Germany, even Brazil do not have the barriers that we have. It is impossible to innovate with so many regulations and threats from an Agency that became rogue. Once our "survivors" are ready for the market, the product is already obsolete.	You need to have better leadership in the Agency. The problem does not reside on the scientists, engineers, and other professionals, but on the fact that top management has been formed for the last two decades based on "who you know," instead of "what you know." With such level of incompetence at top levels of leadership at EPA, knowledge have been stunt, innovation is dying, collaboration is only among their equals: Nothing good can be obtained. You need to clean house, first.

AMERICAN OVERSIGHT

	I
771	No specifics at this time.
772	America has a surplus of innovators, but unfortunately the surplus of incompetent bureaucrats is even larger. Reduce the latter one, or better eliminate them, and our country will have a large menu of new technologies, knowledge, efficiencies and opportunities that will be able to select. The wall that separate us from all of these existent potential opportunities is thick and tall in the current environment.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
773	772	5/9/2017	We now have a travel group who has us put information into a travel form, they then take that travel form and populate information into a Travel Authorization (hence, information is being entered twice), and then the TA gets approved. Anytime we need to make a change (like in schedule) we have to enter all of the information into the form again rather than just calling and telling the person to make a change. We used to be able to have a person that worked directly in the program enter the information directly in the TA so it skipped a whole step in the process. This is very inefficient and effective. In addition, back in 1995 the enforcement programs were all split out from the other programs and it has made things very ineffective and inefficient. Currently we have people that do more "outreach and compliance assistance" that work in the programs, while having others that are completely focused on "enforcement" in a totally different Office. This is difficult when the program is so small to begin with,	Continue to work with states, tribes, and locals as partners and leveraging those program areas where we each have our strengths.	Consider the state, tribes, and locals as our partners. As for the public, we all need to remember why we are working in the government and that ultimately we are responsible for reporting to the communities we represent.	None at this time.	I believe some of the dbase systems we have could be more modernized, but not sure if we have the funding to support changes.	
774	773	5/9/2017	1. Front-line Supervisors need to critically access their staffing levels and workloads on a routine basis. Staffing levels should not be maintained at historical levels just because. Supervisors should be looking at trends to see if work has increased or decreased in certain areas and be able to shift FTEs appropriately. At a minimum, this assessment should take place every time an FTE is lost. 2. Workload should be compared within a unit (peer-to-peer) and outside the unit (other regions, states, tribes, private) to determine appropriate work expectations and FTE numbers. 3. Programs that are obsolete, are not required by law, or are duplicative within EPA or another federal agency should be eliminated. For example: Environmental Justice, Energy Star, Children's Environmental Health, Making a Visible Difference, Field Operations Guidance, etc. Many of these programs are staffed by engineers, scientists, and environmental specialists whose skills and experience could be used to fill	EPA is already accustomed to partnering with states, tribes, and local communities because many of EPA's programs are administered by the local agencies. However, there are a number of things that the EPA can do to improve on those relationships and take the term "partnership" to a whole other level: 1. The EPA needs to truly understand that our states and tribes are on the front lines and often have the primary responsibility for implementing environmental programs. 2. The EPA needs to understand that our states and tribes are staffed with highly qualified scientists and engineers dedicated to protecting human health and the environment. Often, their staff is just as qualified or more qualified than EPA staff because they have first-hand implementation	Decentralizing the agency would help EPA to provide better customer service to the states, tribes, local communities, regulated community, and the public at large. 1. Why have Offices like OECA in headquarters telling regional offices and states how to monitor compliance and enforcement activities? Regional compliance/enforcement offices are way more in tune with what is going on in their regions. Regional staff are on the ground - they understand the industries, the states, the tribes, the politics, the local economies, etc. Headquarters staff, such as OECA, only know see the numbers within a computer program and often the data within that program is in correct or out of date. 2. EPA should incorporate more FIELD OFFICES!!! Region 10 and Region 8 have successfully incorporated field offices into their region. Field offices are closer to their work which allows them to	1. There are entirely too many managers within the Regions and at Headquarters. In the regions, there are front-line supervisors, program directors, deputy assistant regional administrators, a deputy regional administrator, and a regional administrator. In Headquarters, one office may have a program manager, program deputy director, program director, associate assistant administrator, principal deputy assistant administrator, and the assistant administrator. 2. Reduce the size of Headquarters and have them work/coordinate with the regions more often. Why have redundant staff, management, and attorneys in Headquarters weighing in	The agency needs to continually self-access and see if processes, technologies, programs, FTEs are out-of-date or no longer needed. This assessment needs to begin at the lowest possible level and not only supported, but replicated by senior leadership. This will keep agency expenses down and help us to operate in the most efficient manner.	If there are current EPA programs that better align with other federal agencies, EPA should step aside and allow the other agencies to be the lead for those programs. This will allow EPA to better focus on its mission to protect human health and the environment. It will also ensure that federal funding gets to the proper agency, are not split amongst numerous agencies, and therefore, can be more effectively used.

AMERICAN OVERSIGHT

	I
773	
774	The EPA needs to take a critical look at their contracting processes and see if there is a better way. Superfund contracting has been changed to pattern a failed DOE process. Some EPA programs give their money directly to other federal agencies to award (i.e. Army Corps, IHS, BOR) and these agencies aren't the experts. EPA should award EPA money to ensure the money is spent on the appropriate projects.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
775	774	5/9/2017	Some of the trainings are completely useless. Any person with common sense should know the material.		Allow more telework. People are more efficient and more available via cell phone.	Why does each office have an HR, training and a budget person? Can't that be centralized? These people are typically underworked from my experience.	BYOD- Bring your own device. Why can't I check my EPA email on my cell phone? It's a time-saver and a money-saver for the government.	Follow the idea of other agencies with more teleworking and "hotel-ing" so you save office space.
776	775	5/9/2017				EPA has already begun the process of becoming a more mobile workforce. I truly believe that increasing the ability for employees to telework would open the door for sharing space while in the office. I know several companies that offer this "hoteling" where you can go into the office and reserve a cubicle for the day. I work in the information technology section and could easily do most of my job remotely, and the times I would need to be in the office, I would have no issue using a common workspace.	Virtual Desktop Infrastructure is something that EPA and Region 1 (my region) has done substantial testing with. I know the use of this would allow remote workers to function as though they are in the office while maintaining security by not having government information on the remote computer.	
777	776	5/9/2017	Federal Acquisition Regulations! While there needs to be regulations for contracting/purchasing, the FAR can sometimes be restrictive. As an example, there should be more of a push to make awards to small and socio-economic concerns. We do have set-asides but we should loosen further to help these type of firms do business with the Government.	Not a Scientist. But, I believe they need to take more of an active role rather than the USEPA taking the lead. Appears we take the lead too many time and this does not incentivize these groups to lead the efforts.	Quite simply - HONESTY!!!! Once you are not forthcoming, credibility tends to be lost and at times, unrecoverable.	Yes, allow contracting personnel to make decisions on how best to procure items. Do more regional purchasing for economies. As an example, years ago I used to purchase one expensive IT item and so did all of the other EPA Offices. Anything we need to purchase, should be purchased one time versus multiple contracts for the same item by multiple offices. The price for 1,000 each of anything will always be less than the price of 100 each times 10. Also, the EPA has multiple Gyms for its employees. Now, that is a nice perk but it is used by a small number of employees and the price tag is high. I see where we have started to not renew. It needs to be done across	At time, we do not seem to learn from any lessons of the past. We need to start a mind-set of applying lessons learned to most of our daily functions.	There is always a savings when you utilize a shared responsibility mindset. Simply by making multi-regional purchases we could save money and administrative effort which, also equates to money.

AMERICAN OVERSIGHT

778	777	5/9/2017	RTP (EPA Finance Center in Research Triangle Park) needs to electronically interface with EAS (EPA Acquisition System) and with CDW (Computer Data Warehouse). Right now, RTP does everything manually leading to financial errors, inaccurate records, and downtime.			See response to Question 1.	See response to Question 1.	
779	778	5/9/2017		Listen. Be trustworthy. Use science (and joint fact finding if you can't agree on the science).				
780	779	5/9/2017	We are unable to move appropriated funding to contractors to complete core Agency work. We need to hire more contract officers and streamline the process. Contractors are unable to predict workflow from the Agency, plan their hiring and resources for the year, and sometimes need to lay off junior staff with critical expertise.	I do not work directly with tribes, but for many years we have had a good working relationship with states and the private sector. We can of course always improve, but it would be a shame if the success we have achieved in this area were not recognized as part of this survey process. One example we of a previous achievement, which could be a model for future improvements, is technical cooperation with state counterparts to make it possible for industry to report the same information (e.g., on emissions) to states and EPA simultaneously, thereby ensuring the minimum burden for reporters, and consistency of information for states and EPA.	States, tribes, local communities, the regulated community, and the public at large depend on timely and high quality EPA scientific information and data. In many cases, EPA stakeholders do not have the resources to collect the data themselves, or prefer consistency in approach across the country.	Again, I think this survey misses the opportunity to ask for examples of successes with respect to costs and efficiencies, which could be replicated across the Agency.	The administrative processes for time sheet management, employee travel, and allocating extramural funding, are inefficient and could benefit from modernization.	We currently have good working relationships with other parts of the federal government, such as EIA, USDA, USFS, USGS, and DOD. Senior EPA support for these relationships, via signed Memoranda of Understanding, would do a great deal for supporting cooperative work and making sure that missions and activities are aligned.

783	782	5/9/2017	Throughout EPA, administrative support functions lack a basic customer service focus and require too many people to implement those functions. This is true of both OARM staff throughout the agency and their counterparts in the Regions and Labs. The leaders and managers of these functions have long resisted any effort to streamline their organizations and question the need to streamline their processes. Efforts to improve the services provided by these organizations have always been thwarted by "digging in" and outlasting the political appointees attempting to improve and increase the efficiency of service delivery. In my own experience, this was true for both the combined 16 years of the Clinton and Bush administrations. Should the Trump administration hope to make improvements in this area, it needs to not rely on OARM to study or implement the proposed improvements. Surely, these organizations need to provide input into changes, but left in		Customer service within the regulatory programs is an afterthought.			
784	783	5/9/2017		Using the private sector to help with site cleanups and protecting the environment is good, but we should choose companies that are environmentally conscious. Selecting companies that have a good public track record with promoting things like recycling, green initiatives, and other pro-environment things help businesses and reflect positively on the agency. We should employ private sector resources that are good examples. The public will see we not only support businesses, but we also ???double dip??Â by employing the environmentally conscious while being environmentally conscious ourselves.		Idea for reducing costs: I recently updated my life insurance beneficiaries with my local HR office. Our current process is completely inefficient and not cost effective. Under the current process you have to fill out form OMB No. 3206-0136 and MAIL it to the shared services center. If anything is not filled out correctly the shared services center MAILS it back to you and you have to pick it up at the post office (added inconvenience) and re-mail it. If they EPA has 15,000 employees (source was the Washington Post, I am approximating the numbers) and each employee updates their life insurance once per year then it costs the agency 15,000 x $6.65 (USPS 2 day priority mail small envelope	E-signing documents like the good example provided in question 4. We should be moving away from paper based systems.

785	784	5/9/2017				In order to save money and be more efficient, EPA could utilize the contracts it put???s in place and eliminate the duplication of efforts within these contracts. Specifically, the Office of Water (OW) has a number of contracts that overlap some of the services. For example, most of the contracts have a section that says something similar to this, ???The contractor shall also provide administrative support in the planning and execution of workshops, conferences, training sessions, symposia and public meetings.??Â		
786	785	5/9/2017		I'm not an environmentalist, I just joined EPA recently and I work on the administrative side. Removing Scott Pruitt as the EPA Administrator is required before we can achieve any improvement on environmental results with our stakeholders. There is no trust between EPA employees and the EPA Administrator. Scott Pruitt has proved that he's more concerned with protecting businesses than protecting the environment. The new posters posted around EPA showing Scott Pruitt shaking hands with coal miners is very demoralizing to EPA employees. The jobs of 20,000 or so coal miners should not take precedent over protecting the earth's environment. I think I can speak for most EPA employees when I say, my children and grandchildren's having access to clean air and water is more important than protecting the jobs of a few thousand coal	Appoint a new EPA Administrator. Scott Pruitt has shown very little respect for the EPA and it's mission. If EPA employees don't trust their leadership, how can we convince our stakeholders to trust them. When Donald Trump, Scott Pruitt and Rick Perry came to visit EPA Headquarters a few months ago, they showed up with a group of coal miners and had them on stage. Similar to my comment above, this was very demoralizing to the EPA staff. It made it seem like protecting the jobs of coal miners was EPA's most important mission. Protecting the jobs of coal miners is not part of EPA's mission, that mission comes from the Trump administration and their desire to reward the coal miners who voted for him by a large majority. I'm not an environmentalist, but this was one of the most disgraceful acts I've ever witnessed in my life.

787	786	5/9/2017	Having technical staff do all the administrative functions for ourselves (records management, travel, timekeeping, data management) which used to be done by administrative support staff in the past interferes with our ability to stay focused on the technical work for which we get paid. The administrative functions are necessary, but it would help to reinvest in more support staff to ensure that scientific and technical personal are not spread thin doing lots of administrative functions which takes us away from our core program, technical and scientific work	The program I work in already has strong relationships and partners with state, tribal and local community partners. We also have strong partnerships with other federal sister agencies. What limits our ability to support states, tribal and local jurisdictions more is our limited staff and limited grant funding. Increasing our budget, rather than decreasing our budget would help us to ensure we maintain and support strong state, tribal and local environmental protection programs. We have cut programs in the past that helped to foster public-private partnerships, pollution prevention and innovation. Providing more resources (staff and funding), not less, to these ends would help us support better environmental results through partnering.	EPA's budget has been declining over the past 17 years and went through a reduction in force with an early retirement buy-out in 2015. Staff and programs are already stretched to deliver customer service to states, tribes and local communities as well as be responsive to the regulated community. We need more staff and grant funding support to be able to do a better job at timely, effective and efficient customer service not less. Staff are already doing the jobs of 2 or more people and are over-whelmed. Reductions in force and funding will not help, but only hinder the EPA to provide quality customer service to the public at large and work closely with our state, tribal, other federal agency and local partners.	I do not actually see untapped opportunities for large scale changes at EPA that involve big reductions in costs. To be more efficient and effective we actually could really benefit from increased support. We have been operating with a budget and reduced staffing for the last 5-7 years. These levels have been insufficient to ensure as high quality technical support and capacity building for our state, tribal and local jurisdictions. Continuing to move forward on ensuring adequate water and clean water is available to all citizens, ensuring that the air we breath is clean, and that the food we eat is clean, and communities are not disproportionately exposed to contaminants requires ongoing support and	Yes, supporting local scale , more biologically diverse agroecosystems that are less reliant upon industrial levels of pesticides, herbicides and fungicides; supporting and creating incentives for more use of renewable energy sources (wind, solar, water) rather than de-regulating and promoting large scale mining of coal and extraction and expansion of oil and gas.	Look at areas where EPA has not yet delegated programs that can be delegated to states (e.g., National Pollutant Discharge Elimination System programs), ensure EPA has adequate funding to pass through the states so that states can develop adequate water quality standards, address required Total Maximum Daily Load Allocations, and implement protective water quality and water resource protection programs; continue to support Tribal approval for receiving EPA approved Treatment As a State, provide ongoing funding and technical assistance to tribes for their development of
788	787	5/9/2017	I manage grants. For every grant that I manage, I have to go into the IGMS pre-award system and manually download every single file that the recipient has uploaded. It takes between 3 to 10 minutes to do this depending on the amount of documents, file size, recipient. According to quik reports (5/9/17) , EPA has 7125 active grant. A minimum of two people need to access the files for the official record (project officer and grant specialist). Using a minimum of 3 minutes and two people to download, my estimate is that EPA has spent 29.6875 days downloading files. This administrative tasks prevents me from engaging with our partners and providing customer service. There needs to be a download all button to greater reduce the time being wasted on this function. My name is **[REDACTED B6]** I would relish an opportunity to discuss this simple fix that would greatly reduce staff time. It is a small update with a enormous benefit. 787	Adopting and supporting the use and application of technically sound rapid functional assessment tools for evaluating compensatory mitigation banks and in-lieu-fee program performance standards. Support evaluation approaches and methods that incorporate environmental costs in accounting for economic impacts. Look to economic markets that are inherently interdependent upon the condition and quality of the environment and find more ways to ensure longer term sustainable and resilient outcomes for humans and the environment. Mitigation Banking and Conservation Banking may be good models to look at in terms of important businesses that exist due to
788	Updating our IT service. On computer infrastructure in out of date and our programs are not compatible with the latest technology. We are relying on internet explorer that is being phased out and our forcing our partners to have older computer with those systems. We are still using lotus notes for a majority of our functions.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
789	788	5/9/2017	"A manager is a manager is a manger" has been the agency justification of filling management positions to fulfill social economic engineering agendas. Your sex, sexual orientation, race, religion, etc are more important factors than ability to do the job. The agency does not require managers that have technical background, yet these managers are often called upon to improve processes or interpret information. This problem propagates into new new problems. The incompetent manager uses hiring authority to create a buffer of assistant managers and other odd ball management positions--all to mitigate the short-comings of the original manager. Clear goals, real managers, clear priorities, and proper training of staff are a good start.	Clarity, simplicity, and common sense revision of all work processes with genuine listening to input about priorities from private sector. Embed employees/co-locate with our partners/customers. Use of IPA's has historically been used to get rid of problem employees or sometimes as a favor to relocate managers to where they will ultimately retire. IPAs should, rather, be used to develop close relationships and effective partnerships to get work done.	Get rid of non-value management who engage in politics. Get rid of 90% of the Assistant and Deputies--not reassign them---get rid of them. Rotate SES employees immediately and every two years thereafter. The manager is a manager concept is probably applicable to SES employees (but the concept is often extended to first line supervisor) Most SES employees live and die in the same position and create mini empires populated by friends and family. Long term---convert Regional Adminstrators to career employees--too much change with every election.	Streamline regulations and remove ambiguity. Without litigation, the Agency would have no where to turn to resolve ambiguous and sometimes conflicting requirements. Bring back common sense.	No. Any attempt would be a facade. Work processes often incorporate subjective determinations or logic that Agency does not publish. Agency has wasted money trying to automate processes over the years and spends a substantial amount of money for rework. Agency is good at reworking email systems and databases, over and over, for little benefit and high cost. But tasking it to improve systems without changing culture and leadership would most likely lead to more written guidance with little practical benefit.	Stop duplicate oversight efforts with States and other Federal Agencies.
790	789	5/9/2017	Throughout my over thirty-year career at EPA I have not really had problems with administrative requirements, management procedures or other processes. I have been blessed with managers who recognize the need to get the job done and have been very flexible in helping me address any obstacles I may encounter. In my experience, the above listed processes, while sometimes seemingly onerous, are there for a reason. They help ensure that we meet legal and procedural requirements, that we receive proper sign off on actions, and that there is a paper trail to provide accountability. Now that I am a manager, I fully expect my staff to let me know if any of these procedures are negatively impacting their work and I have not had any such complaints. I'm not saying there aren't procedures that could be changed, but I feel that we have already held discussions on that and have already made significant improvements where needed.	Considering that states, tribes, and local communities lack the resources to implement environmental controls and run enforcement programs, it is essential that EPA maintain a strong role. While some states are forward thinking in promoting clean and renewable energy and protecting their citizens, others lack the vision and frankly ability to do so. It is erroneous to think that pollution respects boundaries, so even states with stringent environmental regulation risk having the health of their citizens impacted by lax regulations in other states. EPA is responsible for setting minimal standards and must maintain that role or the health of future generations will be negatively impacted. Existing partnerships are working as well as they can, but without federal support (including but not limited to financial resources) these	EPA is known for customer service to all of these parties already. However, if someone believed the regulated community should set the agenda, they might disagree. The Agency has a history of effective regulation and has crafted that regulation in a way that avoids the loss of jobs, as some have insinuated. Any changes to our existing relationships with stakeholders needs to be carefully evaluated and not rushed into. I worry that the answer that some would seek for this question is that we need to regulate less. If we ever reach the point where industry is not complaining about regulation we have already failed the American citizens and fallen short of meeting our mandate to protect human health and the environment.	This is a discussion that should be held across the Agency, I have been here for 30 years, but even with that amount of time I only know my own program. Any serious effort at making changes has to be organizational. There are most certainly things that can be done, and have been. It is important to note that staffing for EPA is at the lowest level it has been in about 20 years. I only mention that in case some would promote a reduction in staff as a means to "reduce costs and inefficiencies". There is not a person in the Agency who wouldn't welcome a thoughtful discussion of ways to improve efficiency and reduce costs. This has been done on numerous occasions, so any discussion	The Office of Research and Development at EPA is one of the strongest in all of government. The Agency is recognized internationally as already being in the forefront of technology. There are processes that can be improved, such as the correspondence system, grant preparation, awarding of contracts, etc. Again, and I can't stress this enough, this should be the topic of discussion and not be decided through surveys. A lot of manpower and brain power has already been devoted to this area. The problems that do exist are generally the result of government-wide requirements and not anything that is EPA specific.	I can only speak for my office. We already have regular conversations with other agencies. We already devote time and effort to sharing information and working collaboratively. These efforts have resulted in significant savings of time and resources, and have led to stronger decisions. Of course these decisions are driven by science, so as long as that is the guiding principle there can be agreement across jurisdictions. The problems that are encountered are primarily the result of differing statutes, which is the purview of Congress and not EPA.

AMERICAN OVERSIGHT

	I
789	No. The Agency has picked the low hanging fruit a long time ago--e.g. double side copying and taking work generated trash home (to increase recycling versus landfill stats at office) are all a done deal. The Agency needs to take a long pause and rework many work processes (after getting rid of non-productive layers of management). Regulations and guidance have ballooned faster than staff can keep up with. Most meaningful work is done by contractors with little retention by the Agency after the contract ends. This probably can practically only be accomplished quickly if you perform a massive reorg to change the culture of the Agency; if a long-term horizon is acceptable.
790	In my work with international organizations I repeatedly hear that EPA already follows best practices in many areas. For example, our use of independent scientific panels for peer review is recognized as cutting edge. Without that impartiality, our decisions may be influenced by politics. As long as we let science drive the decisions we will continue to be respected and our policies and regulations will continue to be held up in courts, where we have a tremendous history of overcoming suits intended to undermine our protection of human health and the environment.

AMERICAN OVERSIGHT

791	790	5/9/2017	I don't know of any in my current office.	My office frequently works with states and the private sector, with no need for improvements that I can think of. There is little intersection between my work and either tribes or local communities.	I work very hard at doing excellent customer services to everyone who relies on me, including the public in other countries. We've all been on the other end of the phone.	No, not really.	I'm not familiar with technologies that we don't yet have.	In my area, we already partner with other agencies and states.
792	791	5/9/2017	The requirements for maintaining certification as a Contract Officer Representative (COR) are burdensome and not necessary for most of us who manage work assignments for contractors to perform technical reviews. The COR requirements are government-wide, not just for my agency. Most of us spend less than 15 percent of our workhours managing contracts, yet we are required to renew our certification every two years by taking 40 credit hours. There currently are 3 Tiers of COR certification. There should be one more tier between the first and second tiers, for those of us who manage non-construction work assignments.		All oversight for the US VIrgin Islands should be moved from the Region 2 office (NY) to the Region 4 office (Florida). It takes a full day to travel to the USVI, and a full day to travel back to NYC, because there are no longer non-stop flights to the USVI. Consequently, traveling from the R2 office to the USVI is a waste of time and money. It makes no sense for someone at R2 to travel to Miami to catch a flight to the USVI, if the Regional Office can just be moved to Florida. It is true that there is an EPA field office in Puerto Rico, which does inspections in the USVI, but upper management at Region 2 is in New York City.			
793	792	5/9/2017	Time and attendance is very inefficient. It leave requests do not link up with the time card in People Plus. It creates errors and costs time making correction. Our grants and contracting systems/processes are overly concerned with competitive fairness that they have lost their effectiveness. We the process discourages applicants from competing. Managers can keep track of all of the time systems - Telework (regular and episodic), flextime, compressed schedule, comp time and travel comp time (why 2 types of comp time),	We have significant obstacles with working with the private sector. We should be encouraged to work with corporations. There are two good exemples where we are allowed to work with corporations. One is the 5-Star grant program where we partner with the Southern Company and FedEx to administer a good grant program. The other is the Corporate Wetlands Partnership where companies like CH2MHill help local communities implement environmental projects. We should send EPA staff on assignments to work in state and tribal offices. States and tribes have so much staff turn-over due to their low salary structures that EPA can increase its role of technical and policy support. A primary role EPA plays is to help states and tribe rebuild technical and policy skills after staff losses.	We need more travel money. We have strong expertise but our staff and we need to get that expertise out in the states and communities to help them in their mission.	If we improved our very in-efficient administrative systems we could do our jobs some much more effectively. Time keeping, contracting, grants management. We could do "more with less" if our systems didn't take so much time. Giving managers more time to deal with problem employees. 95% of EPA employees do a great job but we cannot get discipline or get rid of the 5% of poor performers and disruptive staff.	We need to make better use of the technologies we have. We need better in-house one-on-one technical support to implement systems like SharePoint and OneDrive. On demand technical support for our mobile devices is needed. We do not make the best use of them.	More interagency agreements. We can partner with the US forest service to improve urban and rural forestry. We can partner more with USDA on agricultural chemical reductions. This is a larger opportunity.

AMERICAN OVERSIGHT

	I
791	No.
792	
793	I'm a manager in the wetlands program R4. I use my incremental funding to train my staff along side of the US Army Corps of Engineers. Training together means we share the same knowledge and develop better working relationships. We are seeing significant improvements in our ability to process 404 permits and to help establish better wetland and stream mitigation banks. Conducting more joint training with our fed and state partners is quite valuable. We need more travel and training dollars to do this better.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
794	793	5/9/2017	We need better ways with fewer administrative requirements for groups (other than states and tribes) to receive and manage EPA grants. We have had many tell us that they no longer will apply for EPA grants because the requirements are too onerous. We need to find best practices from other agencies and figure out how to streamline the number of requirements we place on grant recipients. On the other side, we have given so much flexibility to state and tribes that it's hard to keep them accountable for the money received. Every project officer's income is on the line when we sign off on a grantee's paperwork. We need to find some halfway point where grant recipients can handle the paperwork, and EPA project officers are confident that the grant money is being spent well. The world is no longer run by handshake agreements.	We need clear guidelines on how to work all of these groups as partners in ways that do not break any ethics rules. Now, we can nearly count on being told it's an ethical problem if we ask for guidance on what we can or cannot say. It is very hard to talk to groups about potential activities they can do when they only thing EPA can offer are competitive grants. We also can not bridge the ethical gap to talk to the private sector about ways they can participate to help communities. We need clear guidelines so we know what we can do, say and when.	The Urban Waters program is a national leader in working across agencies and organizations with communities to make real-world improvements in their economic, social and environment. https://fcw.com/blogs/lectern/2016/07/interagency-collaboration.aspx The emphasis is on agencies working together to combine our statutory authorities to do activities that none of us can do alone. By working closely and collaborating with communities it builds political support. And no less important, the Urban Waters program has established a dedicated infrastructure that supports, provides a knowledgeable network, and manages partnership efforts. Through this program, it has become apparent that having a dedicated "ambassador", a person who has dedicated time to learn about everything happening and of interest in that community, has built relationships and trust, and has the	We need to work better across programs to build on each program's strengths. Reduced staff has decreased our ability to take our own personal initiative to make those connections. Somehow, making these connections across geographic locations while maintaining cross-program consistency is needed.	We need better GIS skills and tracking systems to see activities across federal agency and across programs. For example, knowledge of the geographic scope of grants paying for tree planting in an area 303d listed for urban pollutants where TMDLs are being written. We need better ways to see cross program/agency activity. It needs to be segregated by issue area so we're not wading through inconsequential minutiae.	Again, I reference the UWFP program where a dedicated person building partnerships across agencies makes everyone more successful and efficient. The Community of Practice is the initiation of this kind of effort to build staff networks and knowledge across the federal agencies, connecting staff who have been doing the work with those beginning to share their knowledge. This example is working to make these activities more aligned and to share the information across all federal community engagement practitioners so we can be more effective. We have many shared
795	794	5/9/2017	1) Uncertainty in the future of EPA programs is not effective. Please provide more certainty. 2) Reporting on every public meeting we attend where press may be present is not effective. We will do this as it is currently required, but it is an ineffective, inefficient administrative requirement that has been newly instituted by the current administration. 3) Fear of losing programs that already consider the economy and work closely with communities to identify their needs. Please support these already excellent programs more rather than less. And then we will be efficient and effective again.	Base decisions on science and community input. The way to do this even better is to provide more funds and staff for gathering community input on existing or potential EPA programs that the community supports and targeting science to meet those community interests and legal requirements. Support EJ 2020.	Listen to them and act with respect. Especially listen to the poor, the elderly, the children, the chronically ill, and the traditionally underserved communities. Also, do not use double-speak in internal or external communications. Our partners see right through it and so do we, the EPA work force. It is embarrassing to try to serve our community when they see the double-speak that is put out in communications. Luckily, they know that it does not come from their trusted EPA long-time dedicated partners.	Yes. Restore the staff's faith in executive management. This would reduce inefficiencies of us worrying about what lies ahead and if we will still be able to protect human health and the environment. EPA employees will continue to do our good work to protect human health and the environment and we will continue to do so in a fiscally-responsible manner for our contracts and grants; for our community work, for our public-private partnerships, and for our responsible permitting and enforcement. We are professionals and we are American citizens and we care deeply about this country.	Bring current EPA technologies up to private sector standards as this makes good business sense.	We are already doing much to align activities in areas of shared responsibility to support synergy and minimize redundancy with other federal agencies and states and tribes. The best thing you could do would be to support the most effective partnerships through public and internal recognition. Ask the states and tribes which of our programs they like best and where we can improve. Ask the EJ communities where we could do better, and where we have done well. Ask yourself what you can do to realign your own communication and actions with the EPA workforce so that the

AMERICAN OVERSIGHT

796	795	5/9/2017	1. We should allow 24-hour noncompliance reporting under NPDES permits by e-mail. 40 CFR 122.41(l)(6)(i) states that ???The permittee shall report any noncompliance which may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the permittee becomes aware of the circumstances.??Â This requirement for reporting ???orally??Â means this reporting must be done by telephone instead of e-mail, when, as a practical matter, e-mail would be preferable for a number of reasons. I realize that e-mail does not comply with the Cross-Media Electronic Reporting Rule (CROMERR), but neither does voice mail (which is how these ???oral??Â reports are currently received and stored). 2. We should eliminate the prohibition on using subsidized, unlimited transit passes for local work-related travel. In Region 10, we have been told that we may not use our subsidized transit passes for local travel (e.g., using transit	We should strengthen and expand our pollution prevention and resource conservation programs (e.g., Safer Choice, Energy Star, and Water Sense), which are private-sector partnerships. It???s generally cheaper and more effective to stem pollution at the source than to treat it or clean it up after it???s been released.	1. We should finalize the 2016 Methods Update Rule which was signed by the previous Administrator, but which was not published in the Federal Register. https://www.epa.gov/cwa-methods/methods-update-rule-2016 2. To the extent that approved Clean Water Act analytical methods cannot quantify chemicals at or below the EPA???s recommended water quality criteria for those chemicals, we should develop and approve more sensitive analytical methods for use under the Clean Water Act. 3. We should complete the effort to modernize our website, including Regional pages.	We should standardize around a single tool for web conferencing (i.e., screen and webcam sharing and audio conferencing). Currently, we purchase both Adobe Connect and Skype for Business, which have duplicative capabilities. I would think it would make sense to standardize around Skype since it is integrated with other Microsoft applications and with Windows.	1. We should replace our current paper permit application forms with electronic application forms. 2. We should eliminate paper records in favor of electronic databases wherever possible, including but not limited to files related to National Pollutant Discharge Elimination System (NPDES) permits. 3. We should allow outside parties to communicate with us through Skype (as long as such communication is work-related, of course). The last time I checked (which was in 2015), I was told that we could not add people outside of EPA to our Skype contacts, even though Skype for Business has this capability. https://support.office.com/en-us/article/Allow-users-to-	1. We should work with the US Fish and Wildlife Service (USFWS) and the National Oceanic and Atmospheric Administration (NOAA) to streamline the Endangered Species Act (ESA) consultation process. Consultation with the USFWS and NOAA for EPA actions that may affect threatened and endangered species is frequently a lengthy and difficult process. We should also ensure that ESA consultation is not just a paperwork exercise but actually results in better protection for threatened and endangered species and the environment in general.
797	796	5/10/2017	The new administration is requiring a level of review and scrutiny of external engagement and website management that is overreaching and detrimental to the the Agency's ability to share basic information with the public in a timely fashion. The administration would be well served - it it would be in the public's best interest - to consider a more targeted approach to what requires senior-level review prior to release.	Collaboration and achievement requires engagement and mutual respect. The Agency should be mindfully deferential to its external partners, but we also need to strike a reasonable balance and step in where mediation is required.	To the extent that external antipathy toward the Agency exists (a significant majority of the American public supports our mission and our work), it is due to a lack of positive in-person engagement to understand issues and constraints on both sides of the important issues we are trying to address. Engagement requires resources - it can't be done effectively with our online communications or conference calls.	Gmail instead of Outlook, Google Chrome instead of Explorer, Google Drive instead of OneDrive. Free vs Fee. You get the idea.	Incorporate more modern and effective collaboration technologies such as Slack.

800	799	5/10/2017	set up a standard understandable tiered organizational structure. get rid of silly notion of having offices within offices, etc reevaluate notion that all regions 'roll-their-own' organizational structure that sometimes is not aligned with HQ Water programs and enforcement should be in one contained organization - bifurcation makes no sense & drift results in eventual non-alignment.					
801	800	5/10/2017	The administrative requirements, management procedures, and other organizational processes are in place for a reason and do not prevent me from doing my job efficiently and effectively. Due to the important and highly visible nature of our work, it is important to ensure that all work produced within my office and this agency is accurate and appropriate. Thus, there is nothing to address.	I believe the EPA already does a great deal to work with states, tribes and local communities to ensure that when EPA action is required in a town, the local community is involved and aware of what is going on. Superfund is a good example of EPA working hand and hand with these stakeholders to ensure that positive and effective relationships are forged. I would say that it is a great idea to partner with any and all parties whose primary goal is the health of their local population and the environment.	Improving the technological capacity and understanding of the EPA staff could prove very useful for improving customer service. There are a number of communication tools available which due to a lack of training, many staff do not understand how to use. Having Skype meetings to improve professional relationships, using OneDrive to collaborate on work simultaneously with states or local communities, and using SharePoint to provide a single location for all information related to a community would do wonders for providing better customer service to our stakeholders.	As stated in question 3, investing and improving the technological capacity of the EPA would greatly improve the efficiency of the EPA without large changes in staff or policy.	1) SharePoint - Adopted (isn't universal) 2) OneDrive - Adopted (isn't universal) 3) Skype - Adopted (isn't universal) These are technologies which the agency already has access to which are under utilized. Before spending more money on new technologies, it would be smarter to truly invest in what we have now and find ways to improve our use of them.	This is a question for a subject matter expert in this area, which I am not.
802	801	5/10/2017				There is so much paper being wasted during the concurrence process. The concurrence package is created, it is reviewed and edited by first line supervisor. If there are edits, new paper copies are reprinted. Then if upper management has edits, the concurrence package is prepared again. This can go through 5 or 6 iterations before the final package is mailed off. I would suggest electronic concurrence on letters using track changes. After receiving all edits, then the paper concurrence package can be sent out.

803	802	5/10/2017	When filling out your timecard and you have taken leave in the morning, you put in a leave slip for that time. Then unexpectedly you have to take time off in the afternoon that same day. The system will not take a new leave slip since there already is one for that date. So then you have to contact your supervisor to cancel or disapprove that leave slip so you are able to put in one slip that combines the two different times. You then put a comment in telling them what times you have taken. The system needs to be able to handle more than one leave slip on one day. This will save time and money in putting your time in the system. You won't have to bother your supervisor to cancel your leave so you can do another leave slip for both times. I have ran into this situation a few times and had to get my supervisor to cancel the first so I could do another.					
804	803	5/10/2017	Lack of funds at the Branch level. Branch Chiefs should be enabled to send their staff to training and for necessary travel without higher approval.	Increase travel budget	Increase travel budget.	Watching a bee do its thing this morning I was reminded of how heaps of research suggests that the concept of cross pollination of ideas is one of the keys to more creativity and innovation at work. The more people from different areas of expertise mix and mingle and share ideas and perspectives, the greater the likelihood of truly novel ideas rising to the surface. Here are a few ways you can encourage cross-pollination in your workplace: ???Hold job shadowing days where employees shadow someone in a completely different department. ???Hold job swap days - where feasible have employees take over each	More use of skype share screen.	Have us work closer with NASA on environmental issues. - and don't forget Tribes.

	A	B	C	D	E	F	G	H
805	804	5/10/2017	The procurement process is very inefficient and is a major hurdle to doing my job. Currently, we need to get 3 price quotes for items, even as small as a pen, before we can even place an order. We also need multiple sign offs when receiving orders, such as the person who ordering the product cannot sign off that they received it, another person must do this. We also need to get 3 price quotes for items that have a sole source, making the purchase of these items near impossible. Overall, the process takes a considerable amount of time, that prevents everyone here from doing their job.	Learn what methods they are using to generate scientific data for their work. Often enough, there are new advances in science that EPA does not implement or takes several years to implement. These scientific methods are very quickly adopted by private and state corporations.		One of the biggest inefficiencies is the number of meetings and webinars we have. I have been in more meetings at EPA in the first 4 months I have been here than in 5+ years working for DOE and DHS, and I am not in a more senior position to constitute this increase in meetings. Most people that I work with cannot get their work done in an efficient manner because they are overwhelmed with the number of meetings they have to attend.	It takes several years for EPA to implement improved scientific methods, that the private sector implements very rapidly. EPA scientific methods are at least 5 to 10 years behind science that exists in either the private sector or at a university. Ways to speed up the process of updating the current EPA scientific methods to better meet what is available in the private sector is necessary.	
806	805	5/10/2017	The agency's lack of access to common software tools (ie. Autocad, Photoshop[, Indesign) used by the private industry adds a hurdle in the efficiency and accuracy of our work. As EPA Staff having access to these would facilitate the workflow, lessen time-frames and allow for a more direct and efficient communication with our partners and stakeholders.	In order to achieve better environmental results, the agency must make it a priority to always work with a "user centered design" approach in mind. Where states, tribes, local communities, and the private sector take on an active and participatory role in the development of rules, regulations and volunteer programs.	Better customer service comes down to serving the needs of the public. The use of technology - social media platforms, apps, forums - are all great tools. However, there is still a need for "on the ground" access where individuals can connect with each other face to face.	Increasing telework opportunities throughout the agency would reflect a savings to EPA's operational costs.		
807	806	5/10/2017	Mandatory training for multiple reasons. Consolidate mandatory training requirements for managing contracts, conducting laboratory and field work, ORD requirements and agency requirements. We have too many administrative staff that all they do is police us to fill out this that or the other. What they should do instead of being policeman, actually fill out the administrative requirements for us if we supply the information.	We have excellent examples of these in our National Surveys and our Great Lakes Areas of Concern efforts. We collaborate to collect data and share that data across federal agencies, states and communities. The problem with the private sector is they want money. What should be done to engage the private sector is tax incentives if they collaborate with the federal government. Not pay them.	Need more travel dollars in order to meet with the states and regulatory community as well as attending town hall meetings. Our problem is we have too limited travel funds to outreach, understand our client needs better so we can be a more effective partner. when I worked in the Regional Offices I made it a priority to visit each state in my Region once per year at least. They respected me for doing this.	Pretty hard to say given the reduced budget EPA has been working with for the past 10 yrs. If you adjust the budget for inflation you will see EPA has not really been increasing. I think that there are too many people in Washington. 30% of the FTEs in Washington should be moved to the Regions and ORD labs. Look at the manager/administrative staff to scientist ratios. Reduce the management layers and administrative staff for more boots on the ground.	Many of our regulations are 10-20 years old. There should be a 5 year review process for all regulations not to get rid of them but to update them with the latest information that is available. For example, the guidelines for setting ambient water quality criteria for the protection of aquatic life we finalize in 1986. The science has really advanced since that time and newer approaches are available. Have a 5 year review process for all EPA guidelines with an update option	Ambient monitoring is spread across, NOAA, USGS, Army Corpse, EPA, USFWS for water. Develop cooperatives across these agencies to address multiple agency responsibilities. Why is the geological survey monitoring water quality, conducting toxicity tests and sampling wildlife? Focus them more on geochemistry. See how much of their budget comes from other agencies. USGS works more like a contracting firm than a federal agency when it comes to biological issues.

AMERICAN OVERSIGHT

	I
805	As I stated in some of my previous replies, making the procurement process easier is a start. Also, implementing more Lean Six Sigma processes and having management more open to them is another start.
806	
807	Sorry this is a little out of my field. But I would consider reorganization of ORD more along the lines of media than the Risk Assessment process. The risk assessment process is outdated. We need a more media approach to research or problem oriented approach.

AMERICAN OVERSIGHT

808	807	5/10/2017		Make science the foundation of our decisions, not some secret political calculus. Since our Administrator and Chief of Staff are unqualified and completely conflicted, they cannot serve in their respective positions. EPA therefore no longer has any credibility.	Get new and legitimate leadership			
809	808	5/10/2017	eDiscovery tools are extremely limited, do not de-dupe, or sort.	Proposed rules could have a listening session for each sector, including NGOs. Your question does not include NGOs.	EPA could host regular meetings with these entities. However, you could change the EPA representatives to include both managers and staff.	EPA invests significant resources in promulgating and defending rules and agency actions. Prior to withdrawing or engaging in any agency action, a comprehensive legal risk analysis should occur because defending actions (and potentially losing these cases) are expensive.	Better eDiscovery tools for processing litholds and FOIA requests.	EPA needs to first determine what the mutual interests are, and then both entities need to develop a mutual action plan.
810	809	5/10/2017	The biggest issue is that EPA Offices/Regions/Labs do not work together to ensure that their processes and procedures comport with one another. So, many procedures and processes are duplicated or triplicated to accommodate various overlapping jurisdictions (even when there is one clear or key decider). Much work is needed in centralizing and harmonizing all administrative, management and organizational procedures and processes. At the same time that procedures/processes need to be harmonized and centralized, more delegation of action items needs to take place. The lack of appropriate delegation of work leads to confusing and convoluted procedures and processes for even the most simple tasks (e.g., sending a response to a citizen inquiry).	All of the aforementioned partners in this question should have a more active role in developing KPIs for the agency as part of the strategic planning process. All too frequently, EPA is writing its own KPIs and performance measures that it knows that it will meet. However, were these stakeholders allowed notice and comment periods that more specifically addressed metrics, EPA would need to reach further in achieving results and be held more accountable by the public more broadly.	Management needs to be better held accountable for customer service to external stakeholders. Few if any managers have KPIs that explicitly evaluate much needed skills in providing customer service. It is only through holding them accountable through a KPI on such a matter (tied to bonuses, performance reviews and more) that customer service will be a priority in the Agency at manager and staff levels.	Yes. Certain support functions could be consolidated to produce significant savings. Human resources, information technology, grants, and contracts could all be further consolidated into fewer and larger service centers which would not only make such functions more economical and efficient, but also more equitable to citizens and accountable to elected officials in the Executive and Legislative Branches. Also, EPA facilities staff could be significantly consolidated and reduced in size. For instance, within multiple Regions, there is a facilities section that exceeds the size of most program sections in which activities are stovepiped (e.g., one staff person addresses one type	Software and hardware need to be significantly upgraded in the Agency. Of highest importance are digital workflows and big data tools. In all cases, with respect to the procurement of technology and use of it, EPA also needs to better hire top IT talent. Frequently, IT and Procurement staff do not have expertise in the technologies that they are procuring or managing, leading to increased costs and great inefficiency.

813	812	5/10/2017	We have repetitive systems to document and account for work, scheduling, case development and conclusion that I would be nobody really looks at but a few folk and just adds to the paperwork in the office. I often get the idea that someone that has nothing better to do just continuously dreams up things for people to do and forms for people to fill out instead of letting people do their work. But that is what happens when you have too many people and unnecessary levels of management.	We used to have a self disclosure policy in place and that has pretty much gone by the wayside I think that was helpful. With states it is a mixed bag as to the cooperation that one will get on case development. Often times they will just refer the case to us and let us handle the work.	More education on the pitfalls tha industry can get into and more regulatory assistance across the board.	Although no one in my area will ever admit this I believe that we have too many people in our area. I am an attorney in Region 5 and people fight for new cases. I think it is because we just have too many people and not enough cases to go around. My current case load at the moment is ridiculous. We also have several unnecessary levels of management with too many Assistants and Deputies and perhaps not enough emphasis on Senior Attorneys that can assist the younger attorneys. There is no reason why some of these Deputies spend every afternoon walking around visiting with their friends except that they have nothing better to do. In fact if you ask the line attorney about what all these	Up to date software would be nice as well as hardware.	No answer.
814	813	5/10/2017	1. EPA has a long-standing, chronic problem of not clearly identifying decision makers, which results in a variety of negative outcomes, including painfully slow decision making and wasting significant personnel time in the process. Outside EPA, the agency is frequently criticized, and oftentimes fairly criticized, for our inability to make timely decisions. To improve, clearly identify decision makers, and hold them accountable for making timely decisions. 2. EPA culture relies upon too many meetings, with too many people in those meetings. As a result, we waste significant time. To improve, create a culture in which meetings are limited and focused, and in which people are expected to show up to meetings prepared, instead of doing their thinking out loud during a meeting. We could be far more efficient if we truly valued our time, and viewed it as a valuable and limited resource that we should carefully allocate, instead of wantonly overscheduling ourselves in meetings.	For starters, EPA should engage more frequently with those partners. Like many federal and other government agencies, EPA is far too insular. There is a world of environmental professionals outside of EPA, but many EPA employees are not in touch with that world.		1. Outside EPA (and other federal agencies), EPA (and other federal agencies) are often criticized for the "cast of thousands" that work on every project. For example, our state partners will deploy a lean and focused team to address a problem, while EPA will assign seemingly dozens of people to the same problem. While coordination within the agency is valuable, we too often assign redundant levels of staff to the same projects. If we gave work to smaller teams, we could accomplish more with less resources. 2. Media stories report that the EPA political team is looking into closing regional offices. That's not an effective way to reduce costs and inefficiencies. However, there are many	EPA wastes significant attorney time on document review due to sub-standard software. If we invested in the full, updated versions of the Relativity software, as DOJ does (but EPA does not), we would spend some initial capital, but regain hundreds if not thousands of hours of attorney time that is current lost in document review. The private sector and DOJ do a better job with investing in the right software, and as a result, they save substantial attorney time.

	I
813	Don't hire people if you do not need them. Prior to the change in Administration we got a large influx of new attorneys and our general case load per attorney suffered. It was totally unnecessary.
814	In Region 8, we've formed a Content Management Unit (CMU) to centralize FOIA work in the region. It's more efficient and produces better quality FOIA work than distributing that workload to program offices without FOIA expertise. Similarly, the FOIA Expert Assistance Team (FEAT) in OGC centralizes FOIA expertise on large and contentious FOIA projects. Therefore, I'd recommend replicating the successes of the Region 8 CMU and OGC FEAT throughout the agency - centralize FOIA work. With a relatively small investment of FTE, we save significant time throughout the agency, and we produce better and faster results in our EPA FOIA workload.

815	814	5/10/2017				Provide incentives to individual offices to save money (e.g., travel dollars). Currently, the incentive is to spend allocated dollars for fear of having the next year's allocation reduced. Removing that fear and creating alternative incentives will save money.		
816	815	5/10/2017	I work in a regional office. EPA HQ has a lot of expertise, however consulting with HQ is inefficient and can slow a project. I have found that often too many people have a say in a decision, some that are not currently in a role with any authority in a matter. Some of this is because there are too many layers of management in HQ. Also, if something is not working well there is no way to improve it. HQ should send out customer surveys. First it needs to consider the Region as customers. Note that I have also seen regions ignore HQ, including ignore orders. I do not understand this, but it shows that HQ and Regions can learn to work better together. I work in Superfund.	1. At larger Superfund sites, gathering folks together to see who is best positioned to address each part of the site. 1. Allow each party to have bit of independence vs everyone looking over everyone else's shoulders. This could speed up decisions. What never is discussed publicly among the regulators is the cost to the environment from delays in addressing contamination. Fighting to get the "perfect" decision can be detrimental to the environment if it causes years of delays. 2. I have seen situations where EPA has not been as respectful of tribes as we are trained to do.	I would conduct training to help EPA staff understand what it is like to sit on the other side of the table and be regulated or have to live with EPA decisions. This could lead to better cooperation, better explanation of decisions even if someone does not agree. I used to be regulated. As a result, I try hard to explain my decisions so the regulated community does not hear "because I told you to". This also leads to better decisions because it leads to more nuanced and defensible decisions. As a Superfund project manager, I often state that I am both regulator and am regulated. I have found that permit writers cannot adequately explain how to implement a regulation. Since I do not need to obtain permits, but only have to follow technical requirements, a permit writer does not have authority over me and I do not have to accept "because I told you to". I cannot always get my questions answered to the depth I need to		Over time from administrations of both parties, more and more review is needed to, for example, send a fact sheet to Superfund community. This leads to less communication because of the time and effort it takes. A knowledgeable community can hold us accountable, but also help us make a good decision the first time.

817	816	5/10/2017	Laboratory analytical methods using the same basic scientific principles should be harmonized across programs. Significant differences arose in methods authored by different committees at different times with little impact on data quality. This requires private, industry, and government labs to maintain duplicate instrumentation and staff to accomplish the same task.	One specific example: The analysis of water for volatile organic compounds is controlled by multiple methods ??? 524 (drinking water) 624 (surface and wastewater) 8260 (liquid wastes) and the CLP Statement of Work (drinking and groundwater at superfund sites). They all use purge and trap sampling to remove the volatiles from a liquid followed by gas chromatography separation and mass spectrometry analysis. With little effort the procedures could share instrumental settings and criteria. As it is, the steps are written just different enough to preclude a consistent, seamless laboratory procedure.				
818	817	5/10/2017				The Senior Environmental Employment (SEE) Program provides an opportunity for retired and unemployed Americans age 55 and over to share their expertise with U.S. EPA, remaining active using their matured skills in meaningful tasks that support a wide variety of environmental programs. In 1984, the Environmental Programs Assistance Act (P.L. 98-313; codified as 42 CFR 4368a) authorized EPA to establish a program of grants/cooperative agreements to federal, state, and local environmental agencies for projects of pollution prevention, abatement, and control The intention of this program was to rotate SEE enrollees every couple of years. We have SEE		Recommend realigning/centralizing FOIA and grants activities @ the Regional level vs. having these employees assigned throughout the Divisions/Offices in the Region.

819	818	5/10/2017	While I like telework, I think that it may not be as efficient as it once was in the beginning. I would suggest a "redo" or "pause" on flexiplace/telework in order to reassess it's effectiveness. Perhaps having everyone report to their appropriate office for a 3-4 month time period? This might help assess whether workload efficiency has decreased/increased w/telework and it might encourage those who are not as interested in doing an A+ effort to leave/retire. Sometimes I think that people who have been here "too long" don't want to embrace creativity or innovation or even just do things in a timely fashion (not everyone, but it's enough to be frustrating sometimes).					
820	819	5/10/2017	Over the past several years EPA has increased its efforts for centralized control of information and messaging. This effort has hampered emergency responders trying to work closely with response partners and affected communities. Delays in the distribution of information are seen as problematic. In the past, EPA invested in training its emergency responders in ways to better handle media, relate to communities, and communicate effectively. Now EPA seems to want to make sure that all important communications rest in the domain of public affairs.	Actually listen to the States and enagage them - especially when things that we do require us to consider State law. For example, EPA and USCG consider owners of land to be responsible for old oil wells. However, State laws (and State agencies administering them) seem to disagree. This importance difference of opinion has strained relationships between oil and gas divisions in the States and EPA responders trying to implement oil cleanups. I do not sense much interactions between States and EPA (or the Coast Guard which administers the OSLTF) in the arena of finding responsible parties for oil pollution incidents - especially when the federal governments opinion seems to greatly affect the State's citizens.	See above - there needs to be interaction between the States and EPA specific to the issue of oil response and identification of responsible party in the context of oil.	EPA has invested too heavily in its efforts to prepare for response to WMD or similar. Many of the equipment items and personnel resources in which EPA is now spending larger dollars are duplicative of resources operated by National Guard units and other federal agencies. Too many times we find ourselves with all the equipment, but no real role in the exercises or incidents. The dollars EPA invests in elaborate labs and CBRN or WMD response should be more wisely spent on EPA's core mission.		See above. An analysis of the mission of EPA in the context of response to WMD and CBRN events should be accomplished in light of the resources available at other Agencies.

823	822	5/10/2017	Revise and standardize Position Descriptions (PD), our current system is very outdated, cumbersome and should be streamlined. We have many, many PDs that are duplicative, even within the same series. Change performance system to pass/fail instead of five tier system. The five tier system is too subjective and not being implemented in a manner that is producing results or holding employees accountable or giving employees the recognition they deserve. Streamline performance management, increase management ability to deal with performance issues. The current process puts a huge burden on supervisors and is extremely lengthy. Improve the Performance Agreement and Recognition System. The PARs documents are not well designed, critical elements are not well written and therefore are not holding employees accountable. There should be more standardization around expectations and common elements.	We have good relationships with STLs and we continue to build those relationships. We will always have hard conversations, protecting public health and the environment is not easy, however, at the end of the day, we continue to work well with our STL partners.	Streamline processes whenever possible (grants, contracts, reporting), and continue to have conversations around expectations so that there are not surprises.	Records management needs to be streamlined. The process is extremely labor and cost intensive. Improve our electronic systems, databases, electronic submittals. We have a multitude of databases to capture data, they should be integrated, updated and/or streamlined. Some of the data we receive is in paper format, we must then hand enter it into a database, electronic submittal systems need to be invested in to reduce cost and labor.		Standardizing human resources systems, documents, across federal agencies would be a huge improvement. Why does each agency need to develop leave manuals, performance guidance documents etc? This practice is inefficient and leads to inequities between agencies and sometimes within a single agency.

824	823	5/10/2017	Renegotiate the with the unions to allow for: grade demotions and easier firing due to incompetence. Increase the availabilities of incentives for staff level federal employees. Many federal employees work with unmotivated and ineffective colleagues. It is de-motivating to see colleagues who do less than you get paid more than you simply because of time of service or the fact they were once during their career promoted to a higher position which they no longer serve in. It is tragic that if we undergo a RIF, the EPA loses its cheapest and most practically skilled labor component. Require middle and upper non-political managers to move periodically. Managers that stay in a program for tens of years are coasting, are not challenged, have calcified views on EPA programs and priorities, and are less prone to innovate. The 40 hour Contract Officer Representative training required to maintain certification that EPA utilizes is from DOD. As such is geared toward the types of contracts familiar to DOD and is	Defund programs that are not involved directly in the implementation and oversight of regulations promulgated by the EPA. EPA spends a lot of $ to help states and communities with efforts that are useful, but are not this agency???s role. The willingness to help people and states with public health problems where states and local communities have failed or claim not to be able to handle the expense has resulted in scope creep at EPA that spreads budget too thin (staff $ and other $). This has impacted EPA???s ability to oversee and where appropriate regulatory programs such and the Underground Injection Control Program and The National Primary Drinking Water Regulations. I suggest cutting non-regulatory programs and putting staff in regulatory and enforcement programs. Over time, staff attrition at HQ should	a larger regional and field office presence and a smaller HQ staff. to the extent possible, automate reporting done by the regulated communities and make that data available in real time to the public on the EPA website. The public is the best regulator: they are directly connected to their environmental and public health concerns. They should have access to data to make decisions on how their communities go forward. EPA relies on public information we don't publish being "FOIA-able". I doubt many average citizens want to or know how to submit a FOIA so they can find the right information that will help inform their local concerns.	Make more information and data easily available to the public so they can take action through their state and federal reps. An informed public would help maintain environmental protection better.	We need to advance our reporting in many programs to make it easier for the regulated communities. In terms of new technology for in house work, no I don't see a need. I do see a need to keep employees trained in the latest technologies. I work with many people who do not know how to use microsoft excel. I think we should have mandatory tech training in place of some of our other mandatory trainings. I think aptitude with basic computing technologies should be required to maintain a job in the federal government. A recently retired colleague of mine **[REDACTED B6]** yet she did not understand how to use microsoft word or how to organize documents into folders on shared servers. When her services	There is a huge amount of overlap in drinking water and waste water infrastructure grants and services in Indian Country. EPA, USDA, DHHS (IHS), BLM (BIA), and HUD all coordinate separate programs in Indian country (and rural US). EPA usually has the least amount of $ to invest, but is the only agency with regulatory responsibility. In fact, the other agency staff often operates in a regulation blind environment. IHS in particular refuses to help regulate drinking water utilities, thus threatening public health. Use of the EPA tribal set asides from the SRFs and service grants are often overseen by IHS. We could create an
825	824	5/10/2017	Improve the computer program used by EPA to track controlled correspondence known as CMS, Correspondence Management System. It is inefficient and Regions have already identified the problems with the system.		Regional EPA websites should be brought back and allow more flexibility in page design to meet the needs of the public. Make guidance documents and other informational materials available in e-reader format even if it means working with Barnes and Noble, Amazon, and others. This will make the information more readily available to users.

	A	B	C	D	E	F	G	H
826	825	5/10/2017	In my opinion there is way to many layers of management that add very little to the process of protecting public health and the environment. This is true in my Region and I think HQ as well where so many people are involved in producing very little. In general HQ provides little tangible production and serves more as an impediment to progress through interference and meddling. HQ lack of understanding of what is actually happening in the field and in our communities is likely the main cause of their failure. To fix these issues I would reorganize the regional programs to remove as many middle management positions as possible. Give more responsibility to the staff to make decisions. Delegate authorities as much as possible. Why do we have administrative tasks being performed by Division Directors? As far as HQ - If the President really wants to reduce the workforce at EPA by 4,000 jobs most of them should come from Washington DC where very little actual tangible and measurable work to support our core	I think the States could be given more work within my Program (Superfund). But to do this they would have to significantly bulk up there resources and capabilities and be given a significant pot of money. In my Region we have effective States but they do not apply their resources to their environmental programs. Instead they constantly skimp and claim lack of funds. Often they try and push for self regulation which is a failure. If EPA was to scale back and rely more on the States to implement the federal programs we would have to give them a lot of money. In Superfund we already do a lot of partnering with States and local communities. It is an inherent part of our process. Other than asking more from them the only other thing I would change with the States is to try an implement improved communication between EPA and	I think in my program we provide really good service. I think we need more funding and more latitude to use our authorities to get things accomplished in the Removal Program. Superfund Removal is a fast response, high energy, goal oriented group that gets things done. Yet our low funding levels and our management's preoccupation with not doing work to save money hurts us. We should be broadening our authorities in order to use our field expertise to solve problems across the agency programs. Our management tends to be very tunnel visioned with little or no global outlook on the Agency mission as a whole. One specific recommendation as mentioned earlier would be to appoint positions to liaison with the states so that it is someone's main job to coordinate.	YES - reduce the bureaucracy by reducing the size of regional management and the size and influence of HQ in Washington. Empower the highly qualified staff to make decisions. Delegate administrative duties down to lower management and staff levels. A full reorganization of the Agency is in order but I'm not sure the Agency can do it on its own. Past reorganizations have failed. The President wants to cut the workforce - figure out how to remove managers and poor performing older employees. Change the RIF process to get away from seniority based firings. You MUST keep the new hires and the younger people - they are the future of the agency and have the	Administrative issues and responses to HQ take up most of our managers time. As a result, they have lost technical abilities, decision making capabilities when it comes to protecting the environment and general knowledge of science. We are bogging our managers down with so much paperwork they are no more than glorified secretaries. Empower the staff, delegate the minutia. Have management focus on the real work.	Obviously in Superfund if we have the states do more of the work (delegate the program?) then EPA could reduce its workforce and its role. But right now in Superfund EPA is the lead. If we were to delegate the program then the States would really have to beef up their resources and step up to the plate and spend money on the environment. I'm not sure they are up to that task.
827	826	5/10/2017	Top of the list is contracts. The contracting process is broken. It is a very rare contract which is recompeted on time. Contract extensions are routine but also last minute. This leads to additional cost and creates a planning and workflow nightmare.	Changes in technology and IT services is creating a sea change in data collection, storage, analysis and transparency. Purpose defined sensors (e.g. air and water pollution detection) are rapidly increasing in quality and decreasing in price leading to the expectation of large amounts of quality environmental data becoming available soon The easy ability to combine this data with other data (e.g. asthma medication data use) using data and tools from private companies like Google and IBM is going to reveal a much better understanding of pollution. It has the potential for revealing localized problems as well as previously unknown links between pollution and disease, pollution and life style choices etc. Working with the Googles and IBMs of the world as this technology is rapidly developing will help the public have a more	There are many vehicles for working with the States. Over the past few years, the establishment of the E-Enterprise Leadership Council (EELC), a joint partnership between EPA and ECOS, has developed a cooperative relationship at a very high level. State Commissioners have gained access to what was previously more a flow of information to them and is now a sharing of decision making and involvement. A perfect example of this is the involvement of State members of the EELC being directly involved in EPA budget discussions with OMB. The EELC has the ability to sponsor projects which can reduce burden to private companies and State agencies while improving efficiency and environmental protection. Empowering that group to sponsor work and at some level to direct resources for these investments would be a significant step in the powering sharing between EPA and the States.	There are many ancient and silo'ed information systems at EPA and the States. They waste time and money, sometimes in large amounts when the inefficiencies are factored in. However, to fix these things takes time and resources, even with the newer IT approaches (e.g. Agile design) and improvements in IT technology. Smart but not insignificant investments need to be made to make environmental protection and economic growth accelerate. Of course, the first step in looking at modernizing a system is to use a process such as LEAN to streamline the underlying program requirements.	Changes in technology and IT services is creating a sea change in data collection, storage, analysis and transparency. Purpose defined sensors (e.g. air and water pollution detection) are rapidly increasing in quality and decreasing in price leading to the expectation of large amounts of quality environmental data becoming available soon The easy ability to combine this data with other data (e.g. asthma medication data use) using data and tools from private companies like Google and IBM is going to reveal a much better understanding of pollution. 830	829	5/10/2017	I do not believe it is necessary that we report public meetings/presentations that we will be giving all the way up to our Regional Administrator and HQ. In the past, our direct supervisors and perhaps Division Directors have had the ability and knowledge to approve our external presentations, and this has always been fine. We should go back to that and trust that our appointed employees have the knowledge to accurately present topics related to EPA.	We currently work extensively with states and local communities, and I feel that those relationships are strong and vital to the work that EPA accomplishes. We should continue to harbor these relationships via grants, in person meetings and being available as technical experts if needed.	As mentioned above, being at important in person meetings, providing technical assistance, and providing and managing existing grant programs. We should not cut grant programs that states, tribes and local governments depend on.	One thing I've identified that could save money is related to travel. Currently, we receive a daily per diem for food costs, and receive that amount even if that amount is not spent. Rather than do it this way, why not cap daily food costs at a certain amount, and then only reimburse for what is actually spent, signified by receipts. As an example, if there is a $50 cap per day, and only $37 is spent on food, we should only be reimbursed for the $37 (which will be verified by scanned receipts) rather than $50. This would save on money that is currently just given to employees.	I feel very effective with a new laptop, EC500 for phones, and my own conference call line. I think all employees should have a personal conference call line if necessary. It is very embarrassing to work with the public and not have a conference call line free to use.	
831	830	5/10/2017	Pruit should resign. He has no credibility and people won't follow him.					
832	831	5/10/2017	It is very difficult in awarding grants to the states and tribes when the budget is delayed well into the fiscal year. 2-4 actions needed to be taken where one action should be all that is needed to award a grant. This is a huge waste of resources and hurts our partnerships with states and tribes.	More consistent funding. Funding levels have been dropping over the years but the need is still there for all of these environmental programs.	We are understaffed and it is getting worse not better. For improved customer service, we need more staff to be available to work with our partners effectively and efficiently. Also, keeping the regional offices intact would help maintain these partnerships.			

AMERICAN OVERSIGHT

	I
830	Empowering first and second line supervisors (and even some employees!) to make decisions and help form the direction of projects is key. Having to report high up the management chain and even to HQ on easy decisions creates log jams and wastes time. Wasted time is wasted money.

833	832	5/10/2017	The updates to systems always cause problems on Monday morning for log-in. These updates should happen on Friday after midnight.	A more active role in the community, not just for major holidays or earth day events. Actually spend more than a day in a community within your region. Designate a Accountability Coach to make sure things are constantly being done to improve the environment in each region from employees already within EPA and no additional salary.	Employees at the state level should be more engaged and more active in the community. Federal programs should be introduced that actually work	Since lots of people work from home, ELIMINATE transportation subsidies. If you're not coming into the office 5/five days a week, there should be no transportation assistance to work	Apple computers and more knowledgeable IT personnel. Microsoft Office 2016 (we are now using 2010 in 2017)	Too many agencies and no work seems to be done or in a timely manner. Consolidate agencies and realign work duties. Reduce salaries (concessions to save money for the government)
834	833	5/10/2017	IT infrastructure and software is outdated and inefficient. For example, the agency has partnered with the DOI to use FPPS for HR functions. It is practically a DOS-based system that is entirely non-intuitive relative to windows-based systems used in all other functions of administrative support.	Improving and streamlining mechanisms that establish partnerships with these entities. Even without money exchanging hands, it can take months to years to establish interagency agreements, or in the case of private sectors, establish CRADAs. Most EPA staff are very familiar with and have great professional relationships with state, tribal, community and private sector counter parts, there is just an impossible amount of paper work to work through in order to establish agreements that meet compliance with statutory requirements of congressional appropriation law.	Have more public outreach. EPA has been shrinking for over a decade and some programs have had to necessarily been significantly reduced or eliminated to preserve core functions of mission. If we don't have the people and staff to reach out and communicate our actions, it is difficult to receive feedback on how to better serve the public.	While I get that the current climate in the Agency is we have too many federal staff, our contract costs are not more efficient or necessarily saving us any money. For years the question has been tilted toward replacing FTE with "cheaper" contract support. From my perspective, the perspective has been shifted to what work can we more cheaply do with FTE than with contract support mechanisms. Further, if we consider that we need significant Federal Staff levels to manage contracts, what efficiencies are really gained? All of this goes to ultimately most efficiently using resources to maintain environmental protection.	See my response number 1 above.	Because of the overall federal attrition for quite some time, much of this has been already occurring to the extent possible. I know my organization appropriately collaborates widely with other federal agencies and routinely assists states and tribes.

AMERICAN OVERSIGHT

	I
833	Job Share - Hire contractors as permanent employees who have a proven track record for performance and attendance, GS5 or GS6 - If more than 20 years and no advancement, the employee should retire just like in the military, if you aren't a E6 or above - Part Time employment working from home and the employee pays HIGHER medical benefits because you're not coming into the office - Unnecessary travel eliminated - Use video conference for meetings around the country on a SECURE network which reduces travel cost, hotel cost and food cost - Raises should be based on performance and not
834	Well the private sector has the advantage of being able to rely on the timing of a budget and not have 2-3 threats a year for complete shutdown. It is impossible to be responsible stewards of tax payer's money when we don't know what our budget is for the year until 2 months before we need to close out the books for the year. And then as desperate as we may need the resources in support of mission, we don't have the contract administration efficiencies to appropriately make use of those resources so its viewed as not needed. We have actually gone to planning budgetary resources on a hugely variable scale that could mean anything from flat line to decreased resources to a complete

837	836	5/10/2017	The PARS ranking system is demoralizing. The ranking categories (FS, EE, Outstanding, etc) are based on extremely subjective criteria. Some managers are "easy graders" and others believe that an "Outstanding" should never be awarded. (I've received Gold medals and still not received an "Outstanding" from one manager while I used to receive them annually from another) This ranking system has a very negative effect on work performance. The private sector is moving away from it entirely as it makes individuals less concerned about the effectiveness of teamwork and more concerned about how their individual contribution is viewed by management.	It's hard to partner with states, tribes and even the private sector when our scientific integrity has been compromised. In my 25 years at EPA, I never witnessed States or consultants publicly question and even make jokes about EPA's commitment to protecting human health and the environment. That has changed. EPA is now the butt of joke thanks to our recent refusal to embrace scientific consensus and the scientific method.	Integrity, integrity, integrity. We are a scientific and regulatory agency. We should take both roles seriously. Scientific and technical experts at EPA should be valued, not made to feel that if they don't go into management, they have somehow failed. In the Regions, technical experts are capped at the GS13 level (for some reason, HQ allows for a lot more employees to advance to the 14 level.) EPA needs to attract the best and the brightest if we expect to perform our duties and not become the dysfunctional and overly bureaucratic government agency that some accuse us of being.	Mu understanding is that EPA's budget represents less than 0.2% of USG spending. We are charged with ensuring that people have safe water to drink, safe air to breath, and safe soil to till. While reducing inefficiencies is always important, there comes a point where the lack of spending is the source of the inefficiencies. This is the question that should be asked. I have seen EPA waste exorbitant amounts of money "fixing" a problem through brick and mortar infrastructure that could have been fixed via our regulatory tools. The problem is that we lacked the technical staff necessary to have caught the problem. This is often times the true source of government waste.	Yes, increasing Internet speeds in offices to levels that are on par with the private sector. I worked in an ORD lab and couldn't use their GIS software because the Internet speed was so slow.	We are supposed to be providing an oversight role to States. We do that.
838	837	5/10/2017	Focusing on the best interests of industry over environmental protection prevents me from doing my job efficiently and effectively.	More resources and people to accomplish the EPAs mission.	More resources and people to accomplish the EPAs mission.	No, we are understaffed and under budget.	There are a lot of field sampling and laboratory techniques that could be modernized and make things more efficient, but we need more resources and more employees. An automated ELISA is on example of something that make ELISA analysis more efficient.	Create liaison positions for communicating with other federal agencies.

AMERICAN OVERSIGHT

	I
837	Yes, private sector provides a travel budget that typically allows for their professionals to attend trainings, speak at conferences, and maintain their technical skills. EPA used to provide for that type of training and travel budget, but those day, especially at the Regional offices, are gone. Thank you for this opportunity to comment.

839	838	5/10/2017	(1) Administrative Issues: Care should be taken not push people who are different into administrative positions. Agency Managers seem to place diverse individuals into mostly administrative positions and/or assign administrative projects to diverse professionals. I???ve seen some well-educated professional employees relegated to administrative assignments (e.g. driving managers to visit various communities, planning conferences, helping to carrying out grant requirements that are the responsibility of another office, entering information into office databases, etc.). EPA management should be sure to use the talents and education of employees appropriately. It doesn???t seem appropriate to have a GS-13 professional employee spending their time on filing and record-keeping. (2) Revise Office of Personnel Management (OPM) Retirement Rules and Remove IRS Penalties. The OPM rules are the reason EPA employees hang on so long to their jobs. The OPM rules for retirement and accessing the	Managers should be held accountable for lack of diversity: EPA management does not appear to follow the Diversity Action Plan, nor do they appear to be familiar with prohibited hiring practices under the Equal Employment Opportunity Commission. There should be some mechanism during the hiring process where they must certify they have at least read through these documents and made an effort to comply. There should be some place where the Agency managers must show they have looked broadly to try to find diverse candidates and attempt to mirror the demographics of the regional office area that is covered by the Agency. Today, the hiring of young students with advanced degrees and zero experience in the real world is the norm. They are quickly bumped up to GS-13 expert levels, not based upon experience in the	(1) Address favoritism in hiring: Take steps to avoid the constant practice of ???like-hiring-like??Â. Basically, everyone is the same at EPA ??? liberal and/or elite. Anyone that is different will not get hired. EPA is now likely facing the same situation that the Democrats/Hillary Clinton faced when the election was lost. When an Agency becomes too one-sided, like EPA has become, it creates a situation where the regulated public and stakeholders do not get a say in the process until late in the game ??? at the public comment period on regulatory development. EPA should try harder to recruit and hire the appropriate mix of diverse people with diverse perspectives and include those individuals on the Agency???s national rulemaking work group efforts. This will allow more people that can think outside the box to develop more creative options for consideration during development of draft regulations. Having an Agency	(1) Safety Issues with Federal Fleet: The maintenance and safety of the federal vehicle fleet needs to be addressed. The vehicles are often poorly maintained and dirty, resulting in safety issues for employees that must travel. Vehicles have bald tires that are well beyond the maximum mileage life. In one instance with these types of old tires, one went flat resulting in a potential stranding situation for the employee alone in a remote wilderness area. Employees often start traveling only to find the vehicle gas tank empty or the maintenance light on - requiring oil changes, service, etc. No one appears to address these issues (not the traveling employee, nor the manager responsible for the	EPA has not kept up with the private sector on technology. EPA has had the Windows 7 Operating System until 2017 when EPA finally started switching to Windows 10. Staff working at home on their own personal computers often have better technical abilities than at the office. Remote access is not reliable. It???s improved recently, but when first rolled out it was a nightmare ??? often forcing employees to call a national number to trouble-shoot on government work time, only to find it wasn???t a problem with their own personal system, but that of the government system. Computer laptops are old and slow as well. Having a screen go blank for several seconds to log in or switch to another program is	EPA provides grant funding for general water quality monitoring and assessment. U.S. Geological Survey also carries out these activities in a seemingly duplicative manner. There could be some ideas here for reducing the costs to the government.
840	839	5/10/2017	The current process and expectations for contract actions vary between Contract Officers in OAM. The creation of a consistent process with set lists of documents and requirements that all C.O.s would follow plus a set process given to the CORs and those putting in PRs would be extremely helpful.		Create a single call center / help desk for all public inquires and work with the AAships and offices to create canned language and answers for the public.	An easy way to locate what desktop software packages are allowed and preferred for various and available to users rather than referring users to the "GSA schedule".	Allowing the EPA to utilize drone technology for cleanup and emergency response	We should create a policy relating to Personally Identifiable Information (PII) similar to those implemented at the US Census Bureau (Title 13) or the Internal Revenue Service (Title 26) to consistently define expectaions for the public about what data we collect, how we use it and how we secure it, and how and to whom we release the data to

841	840	5/10/2017	Excessive review of work products by headquarters staff and management has introduced inefficiency into various work processes. While the regional staff and management understand the need for national consistency, standard or non-controversial actions should be left to the regions to complete, to limit the waste of time and resources. Investment in more high quality administrative staff could increase overall efficiency. In the 10 years I have worked at EPA, I have seen a large amount of administrative tasks transferred from administrative staff to the staff at large. This results in GS-12 and 13 (or higher) employees spending significant amounts of time on work that could be completed by lower GS level staff and the associated waste of money on personnel costs.	Focusing resources on the regional offices, which are closer geographically and have better knowledge of local issues than headquarters and other "centralized" offices like ORD. Making coordination with state, local, and private partners a meaningful focus of performance reviews. Minimizing travel by headquarters staff to distant (and costly) locations by focusing on having regional staff represent the agency at in-person meetings, conferences, etc. The regional staff are often more familiar with the local issues anyway and can work closely with states and localities at a lower cost than sending headquarters employees.	As stated above, making coordination with and support of state, local, and private partners a meaningful focus of staff performance reviews. Minimizing time spent on internal (within EPA) meetings and activities and focusing time and energy on relationships and support of external partners.	Improving performance reviews, including dealing more aggressively with low performing employees and rewarding those who excel to encourage high performance. Commitment to efforts such as "Lean Six Sigma," including requiring managers to implement all reasonable recommendations that result from Lean projects. I have participated in Lean activities, and employees are willing to seek improvements to EPA processes, but they need the support of high level management to get beyond the weight of "business as usual" pressure against change. Staff cuts can be made while still maintaining	Encourage continued or increased use and availability of "sharing" technologies such as SharePoint and OneDrive so as to allow for more efficient electronic transfer of documents and information. Focus IT investment on support of networking to encourage productive remote work.Also focus on deployment and training of staff on videoconferencing equipment so that staff are more comfortable and efficient at using this technology, which could save on travel costs when used appropriately.	Focus EPA staff and resources on areas where EPA has a "value-added" role. In regulatory programs this is determined by law, but in our voluntary programs, this should be determined by providing EPA expertise where it is unique and adds value, e.g. providing expertise on mitigation of environmental impacts, best management practices, avoiding impacts to air and water quality, etc., to other federal agencies as they engage in funding or technical assistance to states and localities.
842	841	5/10/2017	I think as federal employees we do way too much administrative work, whether it be running around getting comp time forms signed, filling out TA's and getting them signed by 5 different people, logging into the numerous accounts we have to have that all require special passwords. A great deal of my time is often consumed by these tasks that could be done by an administrative assistant or done electronically instead of on a paper form. It should not take more than half a day to set up your travel. When a new employee starts, why do we not already have a computer set up with the programs the division knows they will need? Instead of going through the IT department and several help-desk and form to be signed by managers stating that you do in fact need these programs and software install in order to do your job. There should already be an approved list of programs installed and ready to be used on ones computer by assigned division, type of work, by	I don't have enough experience on this topic to make a viable comment.	No comment	No comment	Having devices that allow field workers to use apps related to the work they do would accomplish wonders. There is almost an app for everything, whether it be plant identification, stream indicators, or environmental hazards. If they are not readily available or capable of doing what we want we could easily contract it out and have it developed specifically to meet our needs. Not only that, we could cut down on the numerous/repetitive forms we have to fill out for the same project or task by compiling them all into one easy to find location where you could sign into an account and put documents pending in a sort of queue that allows you to see who's "desk" your forms are sitting on and who needs to sign	Communication!

843	842	5/10/2017		Disagreements are inevitable giving varying missions of agencies involved. You can use facilitation and mediation to help those involved communicate more effectively. These uses of Alternative Dispute Resolution have been shown to produce results all involved can understand and implement without the need for going to court or getting overly political. Support the continuation of both workplace and environmental conflict resolution. Also, EPA has both an ADR Policy and a Public Involvement Policy. More knowledge and use of the best practices described in these policies would help everyone communicate and cooperate with each other. Many times a neutral facilitator (someone who is not EPA and not one of the other parties) is necessary for all to believe a process is fair. The use of neutral facilitators needs to be	EPA's Public Involvement Policy outlines how to better work with any stakeholder. Read it, google good public involvement principles. Involve public involvement experts in helping to design interactions and communications. Fund travel for EPA employees to meet communities, tribes, regulated community and others in person. It can reduce misunderstandings and build trusting relationships. Isolating EPA people in their offices without any means to see people in person unless those people have the time and money to come to EPA offices is unproductive.	Use good public involvement and dispute resolution resources inside the agency. Give these processes time and resources to work.		Connect EPA's ADR and public involvement programs with other federal agencies. Make these resources known to states. Work through varying missions, roles and responsibilities. Make sure the public and regulated industry know who is really responsible for what. Hold state agencies accountable where there are delegated programs. It was the State of Michigan that did not protect the citizens of Flint, not EPA.
844	843	5/10/2017		Regions should receive extra travel $ to use for paying for state / local officials travel to meetings with EPA (either in the office or in the field) so that the state (or local) folks can actually provide input to EPA's strategy, planning, and implementation of programs. Preferably, some of that money could come from specific HQ program budgets. Travel money is a pretty small part of our budget, but it could make it much easier and more efficient for us to support the needs and goals of the states.				

AMERICAN OVERSIGHT

	I
843	EPA's environmental ADR and public involvement programs have led the way for 30 years - establishing best practices for conflict resolution, collaboration and public involvement. Recognize that federal employees can indeed be world renowned experts in these fields and empower them to continue to educate the administration and EPA employees in best practices. Publicize when we are successful and give some credit to those who work well with others - not just in public service recognition week, but all the time.

845	844	5/10/2017	1) We still have a manual concurrence process in the Region. I would recommend an electronic concurrence process to route a documents through the concurrence process. 2) The Superfund remedial program is embarking on a large change in the contracting strategy which will impact the implementation of the Superfund program. Changes will begin to take effect in the Fall of 2018 when EPA awards the first of this new suite of contracts. One change that I think should be considered is that we do not move forward with a Remedial Environmental Services Contract (RES). I think the current model that has been set up works and is more efficient. EPA does not have the resources to manage the RES contract.	We currently partner with the States in the Superfund program and only take on Sites that the State does not have the enforcement or financial resources to address. In the SF program, the State is required to cost share 10% of the remedial action cost and 100% of the O&M at the Site. The States are under tremendous financial constraints and are often not able to fund their environmental responsibilities. This often causes issues between the State and EPA regarding responsibilities. My idea would be for EPA to have 100% responsibility for the Superfund program. However, for this to work properly, the funding would have to come with it.	In the Superfund program, we have very good customer service with our states, tribes, and communities. I think other areas of EPA could model their customer service after the Superfund program.	The current budget cycle impacts the SF program and leads to many inefficiencies. First, the budget that is provided, is often not sufficient to address the backlog of work in the SF program. As a result, instead of fully funding the work required for the investigation and cleanup of a Site, the work is phased over several years. This leads to inefficiencies and delays in completing the work.	State of the art IT services. The government often contracts these services out and we are often behind industry standards in the use of hardware and software. In the last year, things have improved. However, in the program that I work in (Superfund) tablets would be very beneficial. However, we often do not get state of the hardware because of budget constraints.	The Superfund program has the ability to use Interagency Agreements with the Army Corp of Engineers to perform construction acquisition and management at fund lead Superfund Sites. This has been a successful model for the last 30 years. However, there are acquisition plans within EPA to change that model and drastically reduce our ability to use the Army Corp. This will require EPA to be the construction manager on many fund lead SF sites. The resources have not been provided to the agency for this effort. I believe this is an inefficient use of government funds. The program should rely on
846	845	5/10/2017	Issue: Severe political interference in science issues. Solution: Remove all political appointees from federal science agencies.			Let scientists do their work. Don't burden them with mandatory non-useful tasks, such as preparing travel documents, administrative trainings, etc.	Absolutely - there are numerous new technologies for monitoring air and water quality. Funds and personnel are needed to purchase, evaluate and operate these technologies.

847	846	5/10/2017				Outsource PC imaging / security so the entire agency has one operating system image & one security system - hopefully to NSA or DOD. That each of the 20 Regions/MNMs define their own OS/security is archaic. Each has its own regional ISO - this could be centrally managed. It is amazing the amount of down time with re-entry of LoginIDs and PassWords has to be done each day. Adopt a functioning electronic grant system from another agency that has a 'best in class' operation and revise EPA processes/requirements so EPA doesn't tailor it to their own vision. That is where we go wrong.	Outsource PC imaging / security so the entire agency has one operating system image & one security system - hopefully to NSA or DOD. That each of the 20 Regions/MNMs define their own OS/security is archaic. Each has its own regional ISO - this could be centrally managed. It is amazing the amount of down time with re-entry of LoginIDs and PassWords has to be done each day. Adopt a functioning electronic grant system from another agency that has a 'best in class' operation and revise EPA processes/requirements so EPA doesn't tailor it to their own vision. That is where we go wrong.	
848	847	5/10/2017	The administrative processes and systems in place to support those processes are nearly unworkable across the board. OARM and OEI are primarily responsible for these types of activities. Our procurement actions have been at a near stand still for several years and OAM is understaffed and unaccountable to the delays in procurement leading to inefficient use of resources and inability to perform mission critical activities. Additionally the IT systems related to contracting, HR, payroll, etc are arcane, dense and not even remotely user friendly. The IT support for our basic equipment such as computers, printers, mobile devices, etc is inefficient and baffling. All of these failings leads to loss of productivity, inability to plan, redundancy and waste of resources. Solutions to solving these issues include lifting the hiring freeze to staff up all administrative functions with competent and skilled professionals, allow stability across OARM (no reorgs, restructuring, details) to build accountability, a base of knowledge and vastly simplified	Provide sufficient resources and clear lines of decision making across all Agency activities. Engage with the career staff and experts on issue areas. This will allow for meaningful interactions within statutory and regulatory obligations (e.g., consultation, public hearings, public comment periods, transparency of calendars of senior leadership etc) and lead to improved results and actions that will garner support and withstand legal scrutiny.	Similar to above, engage the career staff and experts, provide sufficient resources, establish clear lines of decision making and transparency across all actions. This will allow the Agency, its staff and its stakeholders to interact in a meaningful way to fulfill the mission of the Agency which is actually protecting human health and the environment.	Yes, detailed in the answer to question number 1 there are numerous inefficient, opaque, duplicative, immovable processes that underline and support the Agencies work. Without proper administrative support, transparent engaged leadership and sufficient resources the Agency will not be unable to fulfill its mission.	Yes, again, the answer to question number 1 details numerous systems and process that if improved/replaced will yield significant benefits. In addition, sufficient resources and frequent and transparent communication from leadership to staff, especially in light of the drastic budget proposals will ensure the Agency is able to protect human health and the environment.	This question presumes activities need to be realigned, rather, a comprehensive review of Agency activities in light of clear Agency goals that align with its mission, statutory obligations, needs of the states, all stakeholders and the public, as well as other USG goals, functions and activities should be completed so any realignment comes from an informed place and likely reaches successful implementation. In the past, likely as an attempt to maximize resources the Agency has adopted systems or processes (e.g., FPPS, people plus, etc) from other Agencies without sufficient consider, review or

849	848	5/10/2017	People Plus is absurd - we are salaried employees. I understand the necessity for leave requests and tracking of those, but the rest of the system places a burden on both management and staff.					
850	849	5/10/2017	The processes for awarding contracts and grants have become so overburdened with prohibitions and criteria that staff and recipients waste large amounts of time trying to understand options and requirements. Grants and contracts staff can???t coherently explain the byzantine rules to program staff, who spend time that should be spent on core work trying to choose and execute the most efficient method of awarding federal funds to accomplish goals. Grants and contracts staff FTEs have been pared back to the point that they can???t afford the time to help much, and are reluctant to take ownership for agreements that just might run afoul of some prohibition. Staff often resort to using mission contracts because processes and criteria for awarding unique contracts are opaque and burdensome, but finding an appropriate mission contract is usually time-consuming and as a spending vehicle usually involves unnecessary overhead cost. Unique grants are similarly difficult to award, and program	Annual meetings to communicate among federal and state programs to set priorities, divide responsibility, and coordinate next steps are essential to avoid accidental duplications and omissions. Because state staff increasingly cannot afford to travel to a central location, travel funding should be provided if we want them to take an even greater role in executing federal mandates. Also, it???s become increasingly difficult to stage workshops and conferences to provide essential compliance assistance to the private sector, due to the gradual accretion of prohibitions and rules aimed at avoiding the appearance of wasting federal funds, and favoring or improperly accepting support from private parties; therefore, elaborate requirements should be re-examined and pared back.	One simple tool would be to post contact info for subject matter experts in HQ, the labs and Regions on our website. The most recent revamp of our agency website for greater uniformity and less maintenance made it difficult to efficiently reach someone who can help you. Simply posting org charts and providing an employee locator isn???t enough. An example of how to do it right: https://www.epa.gov/air-pollution-transportation/office-transportation-and-air-quality-contacts-topic Also, see answer to Q 7.	Eliminate unnecessary management layers that have been created by division chiefs bent on building fiefdoms???for example, make section sizes more standard, and eliminate the branch level where total section FTE isn???t sufficient to justify a branch. This not only saves $, but could streamline communications between programs. Sometimes staff-led teams can substitute for forming new units, and can be formed and dissolved more quickly to respond to new and/or temporary needs. Introduce more uniformity in pay grade levels: HQ staff should not necessarily be paid 1 or more grades higher than equivalent Regional staff, attorneys should not necessarily be paid 1-2	Our IT help staff & contractors are very efficient and skillful, helping all employees function more efficiently. However, delay in approval for federal use of updated versions of basic software forces IT staff to waste time patching in remedies, and the results function less well than timely upgrades would. Elaborate justification is required for installing specialized software, which can impede our ability to provide compliance assistance to regulated parties.	The most puzzling area of overlap among federal agencies is in the realm of energy & fuel efficiency programs. For example, EPA???s very lean and successful SmartWay Transport Partnership and related technology verification program coexists with DOE???s vehicle technologies program. Since EPA regulates engines, it may sense for DOE to cede transportation fuel efficiency programs to EPA. But it may make more sense to move Energy Star, another highly popular efficiency program but one that doesn???t relate to EPA???s regulatory role, to DOE???s office of energy efficiency &
851	850	5/10/2017		Create more collaboration opportunities by committing to regular conferences to discuss pertinent projects, concerns, and progress. Allow more development opportunity for EPA staff by providing EPA staff opportunities for short-terms details with states, tribes, local communities, or the private sector.	Provide EPA staff the resources (FTE and budget) to conduct robust user research and allow for continuous feedback loops between EPA staff and external stakeholders.		Yes, we should adopt agile/lean practices and methodologies, modern software development methodologies, look for tools that allow for collaboration with internal and external users.	
852	851	5/10/2017	Get rid of the silly DUNS requirement.	Have more EPA funds to work with.	More funds and FTE at EPA.	Terminate the employment of all the political appointees.	Accelerate the replacement of Lotus Notes-based IGMS.	Give EPA the statutory authority for funds in from anywhere, like USDA. Reduce duplication by letting EPA do it all.

853	852	5/10/2017	My biggest concern as a worker is the time spent on bureaucracy. What I mean by this is that there are too many different reporting systems, too many people working on what appears to be the same thing. I can understand this modus operandi years ago before PCs and the web, but now is just seems to be a system of checks and balances, which ought to be streamline and trimmed.	I really don't have much to say here as I feel strongly that we already have good working relationships between EPA and states, tribes, local communities and environmental groups and stakeholders. As far as water permits are concerned there is an active & conscious decision to be as transparent as possible in our work product and good use of available technology to reach to a myriad of stakeholders.	I don't have much in the way of comments and productive ideas; perhaps just maintaining an open mind (& purse string) in pursuing all available and changing technology to maintain as much transparency as possible in all the great environmental work being done at EPA! Currently, I firmly believe we reach out as much as possible to all our stakeholders and other parties.	Less bureaucracy and more use of green technology to cut through the muck & stagnation. I believe EPA HQ as well as the regional offices need to "advertise" more of our success stories explaining in simple terms and numbers the strong environmental strides we make year after year. Have media offices proactively searching for the next big "wow story." Get more kids involved in the merits of environmental successes as they will be the stewards of tomorrow's environmental goals and successes.		Dangle a carrot in front of our stakeholders. Come up with ideas for example, giving more aid to communities achieving environmental gains. Working/training state leaders on the importance of change and evolution. EPA already has offices engaged in P2 programs, etc., but what about something as simple as, looking for alternatives to salting our roads in winter, announce a contest - - get ordinary people involved in who we are as an Agency, partnering with future leaders, listening to what the public is telling us & addressing the issues even if the answers are not always the most ideal.
854	853	5/10/2017	Because we don't typically do much travelling, when we do it's much too complicated to submit a request, and work with CONCUR. It used to be quite easy. However, CONCUR is cumbersome, and results in taking too much time for a trip that could be under 25 miles. Having to submit for Travel when going such short distances and using a government vehicle wastes valuable time and taxpayers money. This is an example of a system that has gotten bogged down by technology rather than made more efficient. I would recommend simplifying this by having an administrative assistant or some other employee trained as the Travel Assistant, and having a simpler system other than CONCUR. Also, I recommend removing the requirement to submit a Travel Authorization for local travel even when using a government vehicle to go to a 2 hour meeting.		This

855	854	5/10/2017	EPA's contract management process is very inefficient (OARM/OAM). The current process for awarding contracts, processing PRs, etc., is lacking resources and could be evaluated for process improvement overall.	Re-evaluating EPA's Action Development Process such that the process for development of regulations and major policies would be much more inclusive of states, tribes, and local communities. I would not recommend being more inclusive of the private sector given the possibility of conflicts of interest.	Modernizing our processes (process improvement) but not doing it in a vacuum either. We need to include our state partners in this effort from the very beginning through the end. May be we can detail state employees into EPA (one or two for each program) to help with this effort.	IT/IM management across the Agency does not exist; therefore, there is a lot of duplication of IT/IM development across the program offices resulting in a significant loss of resources and opportunities. The one problem with trying to realize this opportunity is that OEI does not always know the business needs of EPA program offices which would make it very difficult to achieve this opportunity. Another problem is that program offices are very protective of their turf and are not open to new ways of doing business or collaborating across the Agency.	A much greater investment in IT/IM to modernize existing systems and to streamline existing regulatory requirements (e.g., investing in electronic reporting).	See response to Q #4 above, but adding other federal agencies, states, and commercial vendors to that response (i.e., taking advantage of leveraging resources for IT/IM solutions).
856	855	5/10/2017					Improvement in video and audio equipment for large meetings. Quite often there are problems with the audio and visual equipment that cause delays in meeting proceedings. Also, a way to mute individuals calling into meetings until or unless there is a need to receive comments or questions from them.

857	856	5/10/2017	Lack of leadership, knowledge, guidance, and staff throughout OARM, especially HR and contracts management. Decentralized administrative processes at HQ, Also, the the myriad reporting requirements for EEO and diversity efforts which would benefit from economies of scale because they are not really being done in a meaningful way at the program office level though we all spend time and resources talking about it. More generally, the layers upon layers of management for small numbers of staff. The Agency's supervisory ratio is not great and the quasi-supervisory ratio is even worse. Team leaders under Section Chiefs under Branch Chiefs under Deputy Division Directors under Division Directors under Deputy Office Directors under Office Directors.	Partnerships are essential but states, tribes and local communities do not have the resources necessary to implement their programs, financially or experience-wise. Allocating additional funds may help in some instances but, at the practical level, they often rely on our expertise and guidance to help their people stay safe and their business to run efficiently.	engage at all levels of the Agency; staff need to hear the discussions to translate it into the work they do.	hiring/firing but that's a government-wide reform. coordination/consolidation of pieces of programs in the regions and elimination of not statutorily-required programs though those are often the popular ones. Also, less management of work/more management of programs; managers are and are expected to be subject matter experts; not proficient in the ECQs.	federal contracting and budget processes completely inhibit the ability to adopt new technologies or processes because it takes, conservatively, 5 years to begin to put anything into place by which time it's already outdated,	senior political leadership will need to direct this.
858	857	5/10/2017	Employees should be able to use their POVs and commute to off-site work locations directly from their residences with the standard reimbursement (not reduced millage rates). Commuting to the place of employment only to pickup a GOV and then turn around and drive to another site can be a tremendous waste of time. This is particularly for downtown offices like in Boston where sitting in traffic can be 3 hours of the day coming and going, where if one were to just leave from their suburban place of residence they would have that 3 hours to do actual work. Taking home the GOV is often discouraged, the GOVs are often not available to consecutive days, and it can be a burden to park at residences for many in the Metro area.	my manger discourages me from working on anything outside my assigned area. collaborative projects are discouraged.		Region 1 has a policy of not permitting staff to reserve their own flights or hotels, which usually ends up costing the Agency MORE since travel dept won't make a reservation until they feel it's appropriate--despite reservations being fully refundable! When we delay making reservations the cheaper rates are often taken and the gov rate hotels are booked so we end up paying more for airfare and hotel or stuck staying further away from our travel destination.	google chrome for all! google earth online was also just launched. it is embarring that scientists don't have access to these FREE tools commonly utilized by third grade students. Also, we need access to free file sharing tools, like google drive or dropbox. right now if we have a file larger than 25 mb we rely on 1996 technology: burn the file on a CD and MAIL IT to the person. computers are SLOW. for engineers and scientists that do more than just email and word with their computer we need faster processors. if I download 300 gb of data and need to process it into a report my computer just fails me. I'm told to go use the computer room, which has

857	there are many really smart and hard-working employees at the Agency. They come here for the mission and to translate their knowledge and skills into something meaningful, They will help if you tap into them, Currently everyone is waiting to be engaged as we await a leadership team and some direction; a complete waste of resources for far too long. Even a video message from the administrator would go a long way towards that. We read his tweets and facebook posts about his engagement with everyone but the Agency he is leading.
858	We are too program centric. Management keeps voicing for "cross-program" work but then they dole out awards, raises, promotions, new hires by program and everyone is binned by their group.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
859	858	5/10/2017	There are too many duplicative reporting metrics leading to analysis-paralysis. 50% or more of all reporting metrics should be removed. Reporting on these is a burden for states and requires too many program analysts at EPA. More work, less reporting.	Programs that are discretionary function better when utilizing external partners or public-private-partnerships with EPA maintaining the programs through grants. Non-point source grants are a good example of getting targeted pollution control technologies to rural areas. SmartWay is an ideal public-private-partnership which reduces pollution while saving truckers money. Diesel Emission Retrofit (DERA) grants create new technologies and US business niches through grants to private partners. All discretionary programs should be tied to a grant program. Let the locals and industry promote these programs as they are the beneficiaries, and EPA can serve the role of grant management as EPA is extremely effective at grant management, solicitation, and oversight.	There is too much confirmation bias in Washington, DC (in both political parties) leading to customer service that is out of touch with local communities. More resources and programs should be focused out of the regional offices where people are more in tune with the public and the regulated community.	There seems to be a middle-management bulge at EPA. A lot of this seems to be driven by the need to respond to data requests, Congressional inquiries, and general reporting inquiries. All parties, including Congress and associated lobbyists, need to align to minimize unnecessary duplicative reporting and data requests, so the middle-management bulge can be reduced and EPA staff can focus more on performing the work than on reporting on the work that is performed.	1. EPA has the capacity to go to 100% electronic recordkeeping in all programs. This will require rulemakings like the NPDES E-Reporting Rule, but once these are in place, EPA can cut down on office space, cut down on time responding to FOIA requests, and be more transparent. One barrier to this is that the government tends to have low performing electronic management contracts. Larger companies like Oracle or Google could handle these transitions far easier, but rules like SBA and MBE/WBE seem to prevent securing more competent information management contracts. 2. All Regional web sites could be eliminated. It's too confusing for the end-user, and it is not necessary.	Training systems like FAITAS are a good example of how training can be tracked and delivered across multiple agencies through a single platform.
860	859	5/10/2017	Make and process requests for Travel Comp Time earned via People Plus Eliminate separate tracking of credit hours earned and used beyond what is already being done in People Plus	Fully staff EPA and let us do our jobs	Fully staff EPA and let us do our jobs	Allow for agency vehicles and car rentals to be parked at employee residences the night prior to early morning travel and to keep them overnight at trip's end if return is impractical. Remove Trump appointees		
861	860	5/10/2017	The changes in PeoplePlus where employees cannot "take back" their leave requests has created a huge bureaucratic nightmare. With such a challenging workload, it's rare that my leave requests match up with the time I actually take off. Many times, those leave requests need to be amended. But, the new three-step process (ask your supervisory to send it back, fix it, send it off again) is creating a lot of wasted time.

862	861	5/10/2017		1) EPA has a long standing tradition of being a source of funding to states, tribes, local communities and the private sector for environmental and human health programs and on-the-ground projects. Ensuring that we continue to safeguard and provide this funding, and that we have sufficient staff to oversee the proper use of funding, will help achieve better environmental results. 2) Similarly, EPA has been a source of technical assistance for state and tribal environmental programs and to continue in this role, we must be sufficiently staffed and technically trained, or else a greater burden will fall on our partners. 3) Further, EPA is regarded by many of our state, tribal, local and private partners, and the public as an organization that should always be informed by sound science, and we must be able to operate outside the	EPA staff and management work hard to provide excellent customer service to states, tribes, local and regulated communities and the public, through funding, oversight, technical assistance, and interaction with the public. We are an organization of highly professional people. Our ability to maintain, and improve excellent customer service depends on being adequately staffed. We must be able to backfill positions with a range of new and experienced personnel, while providing a work environment and culture that retains our most experienced people. Only by having sufficient and experienced staff and management can we adequately implement our statutory obligations and provide the best level of service possible. Further reducing our ranks and funding is completely counter to this goal.			
863	862	5/10/2017	EPA activities should be based on science and the expertise of those with science and engineering backgrounds. Requirements, procedures, or processes that politicize the work of EPA prevent us from doing our work efficiently and effectively.	Maintain federal regulations. Having different regulations in each state would be inefficient, result in unequal protection of the environment across the country, result in transboundary pollution from one state to another, and would take our country back to days when rivers caught on fire. Show photos and historic monitoring data to remind people what environmental conditions used to be.	Host a series of training workshops across the country providing overviews of the regulations that seem to be most confusing to the regulated community. Provide Q&A time.	Maintain federal regulations. Having different regulations in each state would be inefficient, result in unequal protection of the environment across the country, result in transboundary pollution from one state to another, and would take our country back to days when rivers caught on fire.	Create an app for citizens to take pictures of environmental violations and submit them directly to our Office of Enforcement and Compliance Assistance. Photos would be time-stamped and geo-coded.	The Office of Policy should be eliminated. EPA should be primarily a science-based agency. Policy review is already provided when EPA products are sent to OMB. Having an Office of Policy biases Agency decision-making away from science-based decisions.

864	863	5/10/2017	My biggest issue it our IT systems - they don't talk to each other, they are redundant and/or don't work well, they are not streamlined, and they basically take an enormous amount of care and feeding and TIME!		Less top-down micromanagement. If staff are not empowered to make even minor decisions, and/or don't feel that management will support, or worse second-guess, it adds time and inefficiency.	less regulatory uncertainty. no backtracking on previously approved regulations and programs. keep the science advisory board independent and science-oriented - not staffed with industry advocates.		
865	864	5/10/2017	The most important administrative change is to get rid of Scott Pruitt. Because he is tied to the fossil fuel industry, and his actions to cozy up to the coal companies rather than to groups that protect the environment, has made my job more difficult, because my partners know that the leadership of my organization is biased, and serves a radical republican, and anti science ideology. The back to basics agenda is also embarrassing. -- it reads like it is from the republican playbook. The recent purge of the science advisory board (not sure of the official title of that board), is also disconcerting. Finally, the staff in the front office in HQ are former staffers of Jim Inhofe, a known climate change denier. The climate change website has been deleted. Because of these reasons, it is hard to take these kinds of surveys seriously because you lack credibility. Thanks.

864	for pete's sake, re-delegate the signing of Superfund Records of Decision back to the regions - the idea that the Administrator should be personally involved in all decisions over-inflates the importance of these documents, as well as will only serve to slow down the process. this is NOT the most important program EPA implements!
865	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
866	865	5/10/2017	Requirements for EPA staff to clear any public statements through headquarters are burdensome and unnecessary. Transparency and effective and efficient communication with stakeholders is facilitated by allowing EPA staff to communicate freely and without censorship.	Maintain and request additional funding for EPA programs that support the development and expansion of local, tribal, and state capacity in enforcement and implementation of federal environmental laws. Maintain adequate funding for EPA oversight of programs delegated to the states, which facilitates better national consistency in implementation, permitting, and enforcement, prevents undue political influence from powerful local special interests, and allows states and EPA to partner and share resources. EPA enforcement also allows EPA to fill in enforcement gaps not covered by states, for instance where the generators of the pollution are in one state, while the impacts are felt in another.	Transparency and community outreach are key in communicating EPA???s work to stakeholders. EPA should commit to transparency in decision-making and decision-making based on sound science, rule of law. Decisions should always key back to our central mission, protecting human health and the environment. EPA should be better at communicating the economic and public health benefits of our regulations, which have been proven by peer reviewed studies (i.e., https://www.epa.gov/clean-air-act-overview/benefits-and-costs-clean-air-act-1990-2020-second-prospective-study). Our agency has not done a good enough job touting the vast and multi-faceted economic benefits of our regulations, which has led to the mistaken belief that EPA is a job-killer (even among some members of this administration).	Effective and adequately funded enforcement can reduce costs by increasing compliance; non-compliance in the industry leads to increased costs to the agency from having to respond to accidents, releases, spills, etc. Federal contracting can be slow, costly, and subject to waste; hiring more in-house experts (scientific, economic, and technical) could reduce costs over time.	IT resources and records management should be updated and made more efficient. This would assist in FOIA response and community outreach, which would lead to greater accountability.	Targeted enforcement, for instance in environmental justice communities, can be an effective method for developing partnerships with local communities, municipalities, and state programs while targeting areas most in need of increased enforcement and which bear a disproportionate burden of illegal pollution.
867	866	5/10/2017						In the spirit of cooperative federalism and engaging our state partners, the Administrator could direct the Regional Administrators to establish an EPA office in each of the 50 states. The goal would be to improve environmental results and customer service by strengthening the symbiotic relationship between the EPA and the states, as coequals. For an example of what this might look like and how it might work, see EPA Region 10 at: https://www.epa.gov/aboutepa/organization-chart-epas-region-10-office.

868	867	5/11/2017	We have heard of staff being able to work at home more liberally, and with many having a long commute, that alone could help staff be more productive in doing their work. In addition if more folks used teleconference or other means for staff to join in to meetings it would be beneficial as well as productive. Never mind the moral increase. Too many times does management seem to hold face to face mandatory meetings so although it appears they grant WAH they tend to counter it with mandatory in office days. Standardization of personnel rules for leave, travel, training, awards types of schedules -- as I talk across the agency to peers some seem to have different set of rules to all these items. More equity of them also would be a moral booster. they do not even seem to be the same within each organization. Travel seems we pay a lot for fees for travel, the agency should promote that calling the travel center should be rare					continue to work on ensuring processes are on line, we have single sign and/or we do not have what seems like a thousand passwords to remember. that alone times all the staff could save time. promoting better go green within epa for recycling and education of the staff of how and what they can compost vs trash or recycle	We should transfer as many of the financial, HR responsibilities out of the Agency as possible and redirect staff to work on the actual mission of the agency as possible. This does not meaning replacing but retraining, educating where possible. Contract out for facility, transit, travel, payroll, and as many administrative processes as possible, and/or centralize so at least that provides as much equity on how we do things across the agency. Look for who does it well and gain their best practices.
869	868	5/11/2017	Cooperation from all (the key to efficiency and effectiveness) and trust from management (do away with favoritism)	Continue to provide best service(s) we can	Communication - being truthful re loss of $$$ due to budget cuts		I think EPA is up to date (as far as I know) on all new technology.	more communication and working together between divisions and sharing information
870	869	5/11/2017	PROCURMENT PROCESS and requirements for 7 sign offs prior to making the purchase. Could never understand why if I see an item for $35 I need to go through a very long draw out process of approvals and research to purchase the product for $132. This obviously doesn't include the time of high paid employees that need to sign off. TRAVEL PROCESS - "It's the Law" Why do we have to select from a list of low budget hotels that a service decides are best when we can call ourselves and get the govt. rate for the hotel we prefer. Why can't we get a flat rate and pay the difference out of our pockets? By the time you pay all the people to get involved and the fees to the service, you have paid double for the cheap motel.		Partnership, Partnerships, Partnerships. Be visible, don't just sit at your desk an bark orders at your partners in projects. Get out there and show the communities that you are working with them and not here to punish them. They are more responsive and do not dread seeing or hearing from you. I have seen some grantees that have had their grant for two years and still have not met their Project Officer.			If you make it a point to include the state/tribes/historic preservation early on in the process, not only do they feel they are partners but cut some slack to the end users as they feel there are several sets of eyes that are all in agreement.

AMERICAN OVERSIGHT

	I
868	Region 1, 7, 8, ORD centralization of travel prep. De centralized financial processing of R 1, 2, 3 and 7, they can do more of the work with less staff, vs pushing the financial/budget/personnel processes out to each of their divisions. Saving staff and time, and ensuring processes are done correct, efficiently and in many cases at a savings.
869	
870	Involve them in the process. Listen to their ideas and compromise to make everyone comfortable with government.

	A	B	C	D	E	F	G	H
871	870	5/11/2017				Environmental Management System (EMS) Need to reduce the paper burden and internal process documentation and audit requirements imposed on EPA office building locations to maintain EMS programs current and up-to-date at each office building location.. To do the EMS properly as currently set forth, requires more resources than we have and I /we don't think the return on the investment is worth the additional time in EPA's office building locations where the primary activity that takes place by the workers is to sit at a computer or desk for most of the day. It makes some sense to have EMS programs at our laboratories where chemicals are used/stored but much less so at office		
872	871	5/11/2017	The only requirement/procedure/process I have encountered at EPA that seemed like an unnecessary use of time were the Federal Acquisition Institute online trainings in the FAITAS system that were required to maintain certification as a Contract Order Representative (COR). Several specific on-line trainings were required and they were generally not applicable to the type of work I would do as a COR.	Partnering with states, tribes, communities and the private sector has always been critical to achieving environmental results in my work. To sustain and continually enhance those partnerships, both EPA and states depend on having adequate staff and resources for successful collaboration. It takes considerable time and sometimes travel to develop and continually improve these partnerships. If staff is overly stretched and does not have adequate resources, these partnerships are likely to suffer.	Excellence in customer service and keen awareness that every customer we deal with is a tax-payer has been of utmost importance to me in my role at EPA and is something I strive to enhance every moment of every day. To continue this high level of excellence, it is critical to have adequate staff and resources to perform proactive outreach and timely, thorough response.	Continuing to improve our computer and information system technologies will continue to make our work more efficient and effective and enhance opportunities to work remotely.	Continuing to improve our computer and information system technologies will continue to make our work more efficient and effective and enhance opportunities to work remotely.	Any program I have ever worked in at EPA has always needed to focus on continual resource sharing and optimization with states and federal agencies.

873	872	5/11/2017	508 Compliance - I understand the importance, but you practically need a law degree to understand this rule when trying to purchase any equipment. Here is an example of what I mean, when following "directions" on how to process 508 compliance documentation for purchase I got the following response that requires my follow-up: the vendor???s VPAT only addresses 1194.21 and 1194.31 I will need something from you not only saying that you ???have conducted product research??Â but that you have conducted product research and either 2.b, 2.c, or 2.d apply - There is no explanation of what product research. Lets streamline this nonsense.	Providing solutions rather than litigation, if we could work with rather than litigate against - that would be the best scenario. For instance I've seen EPA requiring NPDES permitees, especially WWTP - (towns) to analyze for a large list of pharmaceuticals and endocrine disrupting compounds in their effluent, at great cost to the cash strapped communities. EPA should have a national policy on what the requirements are for NPDES permits, and not require hugely expensive "research" analysis at the whim of a single permit writer.	Having these groups networking with the EPA regional headquarters and EPA regional labs, we have had great success with this, and the states really feel we are partners - this should expand out to tribes and especially the communities that may feel our only purpose is to enforce.. I know personally that many states highly respect the work we do and rely upon our expertise and our scientists to help solve problems and collaborate in times of need.			
874	873	5/11/2017				I think every dollar spent at EPA is in investment that pays off exponentially in savings with human healthcare, environmental cleanup, and long term litigation. Better to spend the money now and prevent spending more in the future.

875	874	5/11/2017	I believe our procurement process...at least in the Region 3 area...is overly restrictive and inefficient, especially for items that are under the $3500 dollar amount. But, this is true for many of the higher cost items that involve support contracts. We have wasted much money including many staff hours trying to meet the overwhelming number of requirements (or perceived requirements!) for purchasing. I believe the first way to fix this, is to give the purchasing staff more training and the incentive to help those of us who are trying to purchase something which we need tor performing our jobs. The purchasing staff should have the attitude that we are their customers and that they should be helping us obtain the right items in the most efficient manner. But, this can't happen if the procurement staff is understaffed and under pressure. I hear more complaints about the ability to purchase an item in a efficient manner, than most anything else. Improving this area would improve our organization overall. Thank you for					
876	875	5/11/2017					The technologies that have the most promise in this regard rely on capturing and storing environmental monitoring data. Region 4 Superfund program is requiring environmental monitoring data to be submitted to the region to enter into an EQuIS database. The data can be evaluated in a number of software platforms such as ArcGIS or by EnviroInsite. I just took training in EnviroInsite. It is powerful to be able to evaluate trends in data and identify samples exceeding a standard. Graphical presentation of data and other features available once data is electronically available eliminate ambiguity in interpretation of environmental data and eliminate some of the back

877	876	5/11/2017	Management puts too much emphasis on fluff work like developing databases that no one will ever use. They send multiple people to events or meetings when just sending 1 person with the knowledge to answer questions and represent the Agency is all that is required. The lack of management's ability to make decisions and trying to get consensus on everything is a real detriment. Managers who ask for work updates to spend time reporting on work that does not change from week to week so they just want to get face time with senior management.	We need to do more cost benefit analysis on what we do. For example in lieu of giving out money for projects it might be more cost effective for us to provide the equipment for a project via an in-kind grant. Also this is a questions we should be asking our partners. What can we do to help them and at a minimum explaining why we may not be able to meet their needs.	None at this time.	One way is to reduce the manager to employee ratio. I work in an office that has one GS15 supervising 11 people, Of those 11 people the work could be performed by 7 people. At DOD for what my manager does this would be a GS13 position. Some branches could be combined such as grants and contracts, however if this was done they would want to GS 14s to manage each area which would defeat the purpose. Far too many at this Agency want to build empires and do not really care about improving how the mission is accomplished in a cost efficient manner. Awards are given out just to give awards. The employee review system is ineffective. Managers will not give someone a bad rating	The EAS and Compass systems are constantly having problems. Furthermore if I actually utilized the EAS contracting system as I am supposed to it would more than double the amount of time it takes me to get work done. Currently with technology as it is I can and do most of my work for my customers independent of my manager. In fact I have very little interaction with him other than his morning stop by to see if I am at my desk, or his emails to see what I am working on because he wants to meet with his supervisor to tell him what we are working on. Outside of some level above review regulatory requirements I could be more aligned with my customers and that would be 1 GS15 less coming out of my	Currently the Emergency Response Program appears to be aligned perfectly with our partners and works closely with them. One thing that might be considered is allowing for more flexibility in realigning activities to address priorities. If a certain pollutant is identified bring together a strike team to address the issue who will work closely with the states or other federal Agencies.
878	877	5/11/2017		Provide a few work stations for State and Tribal counterparts to work in EPA's office. This has worked well in the past with MassDEP in the NPDES program. The state or tribal counterpart works one or more days each month in the EPA work station. This provides ready access for in person communication. Coordination between federal/state programs is timely and collegial. I can not overstate the improved cooperation that comes from personal interaction. Conflicts with faceless bureaucrats are replaced with cooperation between respected partners.	Do away with generic answering machine greetings such as "I am on the phone or away from my desk." Such greetings are worthless. Replace with; Hi this is***, and this is the week of May 8th and I will be in the office Monday through Thursday." This gives the caller a reasonable expectation as to when the staff person may hear their message. The generic greeting leaves the caller to wonder if the staff person is on the phone or on sabbatical.	When I first started with EPA, we simply turned in receipts for tolls and parking and were reimbursed in cash. When you add up all the staff time an expense it takes to process an expense voucher for local travel, the cost of the process itself is far exceeds the reimbursement. For expenses under $100, the Region might limit approvals to the first line supervisor. A combination of random audits and ???flagged audits??Â, for requests that are too frequent or appear odd will keep the system honest. It is not cost effective to micromanage every tiny expense.

877	Specifically no however there are many good corporate practices that could be brought to the Government side. As stated above more long term cost benefit analysis needs to be performed which if done correctly will allow us to make more cost effective decision for the future. Certainly senior managers need to hold the managers more accountable, and the managers need to hold the employees more accountable. One easy way to reduce cost is to reduce the number of managers. This Agency is top heavy in GS 15s and SES. There is no reason that the Regions should have SES positions heading each division. I have not seen this at other Agencies I have worked at. The other Agencies I

882	881	5/11/2017	The Office of Planning, Analysis and Accountability within the Office of the Chief Financial Officer creates an exaggerated reporting burden that goes beyond what is required by the Government Performance and Results Act and OMB. Their impact is agency-wide in that all program and regional offices have to respond to their burdensome requests in some capacity. Their processes such as the annual performance plan and strategic reviews could be streamlined to focus on core requirements to abide by the law and OMB. They also have an excessive amount of staff that review and comment on each requested product that results in multiple back and forth between programs and OPAA - this not only impacts program staff assigned with responding but also within programs who are the subject matter experts whose primary duties are not on these initiatives. The agency should take a hard look at OPAA and their processes to allow the agency to better use their limited resources on our core work		Determine a streamlined way to make our SharePoint sites accessible to the public to increase transparency and collaboration. Currently, the process requires a public user to have a Microsoft account and then request access which has to be approved. This limits the accessibility and collaboration on various environmental products.	Same answer as #1.		
883	882	5/11/2017	OECA's Supplemental Environmental Projects (SEP) policy is arduous, difficult and limits opportunity. The SEP policy would benefit from sImplification. It is difficult for industry to understand.	We used to have a program called Project XL which sought to revise regulation. This method could be used to revise certain RCRA and water regulations involving industrial sectors and categories, sometimes the chemical pollutants identified were those from the seventies and eighties, but currently these sectors no longer use these pollutants (unfortunately sometimes worse but unregulated chemical pollutants are now being used). Revisit chemical pollutants used in industrial sectors.	Frankly, I think we do a great job at this.	. I think one of the most inefficient aspects of working at the EPA, when compared to the private sector are all the regulations that congress imposes on the federal workforce. There are significantly more bureaucratic hoops to jump through for any aspect of government work, and it appears congress imposes these "hoops". However, I think that many are necessary to assure that government employees meet ethical requirements, maintain proper records, and assure that we do the work of the public. 884	883	5/11/2017	The hiring system should be revamped so that we can get the best and brightest staff possible. One critical component to this would be to allow hiring managers to review all applications, rather than having the shared service center screen them.	States rely on EPA's national recommended water quality criteria which are published pursuant to Section 304(a) of the Clean Water Act. Unfortunately, many of the 304(a) criteria for protection of aquatic life are out of date, especially for metals. For example, the lead criteria were last updated in 1984. Unfortunately the branch in the Office of Water that works on 304(a) criteria is very small and woefully understaffed. EPA should expand this program and prioritize updating the national recommended water quality criteria, especially the aquatic life criteria for metals. In some cases the criteria may become less stringent and in some cases they would be more stringent, but at least they would be based on the latest available science.	States rely on EPA's national recommended water quality criteria which are published pursuant to Section 304(a) of the Clean Water Act. EPA should expand this program and prioritize updating the national recommended water quality criteria, especially the aquatic life criteria for metals. In some cases the criteria may become less stringent and in some cases they would be more stringent, but at least they would be based on the latest available science.	Modernize or eliminate the awards program. The awards take so long to process that people are awarded for projects they finished more than a year ago. Also, people who are most diligently doing their work, but not on glamorous workgroups tend to be overlooked while people who had a minor role in a workgroup get awards. Many people perceive the system as unfair. It is nice to recognize staff, but the cash awards are not really necessary, and do not seem to provide any incentive to work harder or better. The money would be better spent and more appreciated if it were invested in technical training.	1. The IT department should offer training on Microsoft Access. We now have it on our computers, but there is no training available for it. 2. In this day and age all managers should have EPA cell phones so that they can easily access Microsoft Outlook while on the go. That is not the case in the region that I work in.	We are currently working very closely with our states and are constantly trying to enhance our relationship with our state partners in the region that I work in.
885	884	5/11/2017	Management MUST start allocating all (or even most) of the funding (contract funds) they receive at the start of the fiscal year. Now and for the last several years management does not really know the level of contract funds they will actually receive each year. So large pools of money are withheld/kept in reserve - again, usually 6 months or more - just in case something comes up or is changed by upper management. The "reserved" funds are not committed/spent on projects until another fear/concern kicks in - that if all funding is not allocated/committed by the end of the fiscal year, next year upper management will see the surplus and reduces the level of funding allocated. This often - regularly - means that new and on-going projects/work is put on hold for at least 6 month. Then 6 months into the fiscal year money is	Achieving better environmental results from any partner is really straight forward. EPA needs to work with the partner (this time I'm not including the private sector) by first allocating funds to assist the partner in beginning and continuing the work on a project. Almost all Local/State governments are low on money. I think they WANT to do the stated environmental project but other local issues - roads, infrastructure, etc. - have priority. Secondly, management must make sure and make it a priority that the needed EPA employees are available, have the time, and get buy in from their supervisor to work with the partner (again, I'm not including the private sector here).	Just like #2: Provide and encourage the people to do the job, make sure that management cooperates, and of course, supplies the necessary level of funding.	Correct the inefficiencies discussed in Question 1 is a start. Secondly, ALL levels of management must understand and accept that some of EPA's goals cannot be achieved on a short time scale. Cleaning up an area is good but if the source of the problem is not addressed what good does is cleaning up that area. The problem you "corrected" just reoccurs. Accepting that some goals can only be addressed from a long-term viewpoint AND allocating the budget and manpower in this manner will, again in the long-term, reduce costs and inefficiencies at EPA, while maintaining environmental protection for all Americans.	Sorry, answering 1-4 took it all out of me. Parts of those answers/suggestions would probably address this issue/question, too.	Sorry, answering 1-4 took it all out of me. 887	886	5/11/2017	Shared service centers - While expected to save $ and be more efficient they are not. In hiring alone, we are having to revise and re-submit items repeatedly. There is no standard in which they work from and the standards change depending on who is looking at your submittal. Delays have resulted in not being able to bring on new hires in a timely manned. Bring HR back to the regions or at least allow the Regions HR staff to get involved and assist when the shared service centers are backlogged. Sufficient management tools do not exist to efficiently track and manage work products. Invest in tools that Regional managers need since Regional employees are the ones enforcing regulations and are the boots on the ground. Our work products are not the same has HQ.	EPA should have a significant oversight role but also a consultation role with our partners. Unfortunately Regions do not have the staffing necessary to perform these tasks. The key to better environmental results is improving the quality of oversight and being able to provide our states with consultation services (legal, technical, lab services etc.) This would require staffing and database systems that are easy to use and add value, not create more work and track metrics for the sake of tracking metrics that are not used for any purpose.	Increase Regional staffing levels to be able to properly assist, advise and support states, tribes and local communities. Provide databases that can be linked that are easy to use and capture valuable information, not jut metrics for bean counting. EPA is far behind in technology and we need systems to manage the needs of our customers and for sharing information. Following databases that cause more work for us and our partners than produce efficiency - CEDRI, TMS, WQX.	Yes. Standardizing procedures and processes between HQ Offices and Regions. Provide systems that communicate. We should not have to send in word documents and spreadsheets to report numbers to HQ-OEI QA Database for audits and inspections that can generate the reports and track findings, violations and corrective actions. Again it has to be easy to use and of value when designing such a system.	Absolutely see all comments above.	I don't think we need to necessarily realign activities. Possibly realign at a higher program level. Example-NOAA has a Marine Debris Program, EPA should support NOAA activities and not re-create what is being done by NOAA. We should be asking NOAA what they need from us to help and provide or collect the data they need.
888	887	5/11/2017	The biggest administrative requirement keeping us from doing our job efficiently is the executive order which has severely limited creating new regulations. While we understand the impetus for this, it also adds another layer of bureaucracy which makes it difficult to produce regulations that could potentially be useful. Unfortunately, there???s no easy fix for this from the EPA standpoint. On the EPA level, the biggest hindrance to efficiency is the lack of political appointees present as well as huge lack of communication between the present political appointees and the career staff. This is particularly preventing my organization from communicating our work to the highest levels ??? and this is fundamental work that LITERALLY prevents radiation from affecting individuals, tribes, and states. Having no means to reach the upper management means we don???t have advocates helping us allocate resources. This also means we go by unnoticed and it	EPA currently has good procedures in place to work with stakeholders and the public and to get their input in crafting regulations and guidance via public comments sections and town halls. However, because many of the work we do will affect people on the local level, it might be useful to emphasize more site visits and public forums at the local level.	EPA already has many methods in place to do this. However, we could provide more avenues for public outreach by having phone lines available for public comment to be recorded. This could also mean expanding EPA???s partnerships with other federal agencies working on local projects and better coordination with Congress ??? especially with representatives and senators whose districts our work will apply to. It could also mean better coordination with municipalities by finding liasons and having them have direct contact with the EPA. This could also mean expanding our use of social media.	The biggest untapped potential at EPA are the employees, their talent, and experience. The best way to improve costs and to find new innovative ways to perform our jobs is to foster avenues for the various offices to collaborate ??? even down to the branch level. Scientists in one office for example, may benefit from the experience and expertise of scientists in another office and come up with innovative and cost effective solutions to approaching an environmental issue. They may also help each other understand how to solve problems or interpret data. This could come in the form of more seminars, groups, professional development, lunch and learns, talent hub, or agency-wide events.	EPA could try to use social media more aggressively and make itself a bigger presence on Twitter, Facebook, snapchat, news outlets, and other pages. Because so many of our programs are voluntary, more than anything else, communication is one of the most important tools.	Encourage professional development among employees, especially for government conferences where other agencies are present. EPA can also host meetings and our own conferences to encourage more partnering with other agencies ??? the incident command system course is one very successful model for how EPA has coordinated with other agencies.

889	888	5/11/2017	OLEM National Remedy Review Board (NRRB) review process for all Superfund remedies >$25M is time consuming and costly (every Region travels 2 x per year + put together extensive documents). NRRB was originally initiated to ensure remedies were cost effective. They used to track $ saved. Over the years due to membership turnover the charge changed and resulted in the NRRB second guessing Regional decisions which in turn caused additional work (more sampling, additional contingencies on the remedies) thus increasing the cost and burden. The Board should either be dismantled or changed to only Ad Hoc membership with specific real life expertise on the proposed cleanup remedy. Membership is 1 rep per Region, OGC rep, OECA rep, OLEM reps. Sunset any OSWER Directives older than the year 2000. Most are outdated. There are at least several hundred directives. Unwritten policy on NOT using Drones.	Work with the states up front to set priorities and divide the workload since the States/Tribes do not have sufficient resources. The more complex work should be completed by the EPA in partnership with the States/Tribes since they don???t have the technology or resources necessary to accomplish the work. Use agency Performance Partnership Agreements/Grants to document the division of labor between states and EPA. Consult with OGC and OECA since they are hesitant to try anything that???s new or different. We should ???pilot??Â new approaches to determine if the outcomes are acceptable.	Allow the Regions to work with the customers to try new approaches. As noted above, any new approaches are typically frowned upon the EPA Headquarters. The communities that are served by the Regions are all very different and one size fits all does not work. There???s too much HQ overhead directing the work versus workers doing the work. Allot of HQ staff that oversee the work have no direct experience in that arena and often have misconceptions on how communities, industry, states and tribes interact. Allow the Regional enforcement programs to conduct compliance assistance visits as was done during the Bush Administration. Program staff preferred this method versus the one size fits all approach. Regions used to do outreach to industry when a new regulation was promulgated to ensure clear	OEM should dis-invest in PHILIS (mobile lab for chemical warfare agents (CWA)). DOD has that capability and it falls under their jurisdiction. OEM spends about $3M/per year maintaining it. DOD had funded 4 Regional Labs to develop the capability to analyze for CWA. Maintaining the structures and equipment for that capability is expensive and has never been used. Maintenance has not been paid for by DOD. Any equipment should be released to DOD since that work falls under their jurisdiction. Make sure that ORD research supports the regulatory and cleanup programs. They should work	The Agency time keeping system People Plus (PPL) needs to be updated to allow entry of time at the beginning of the day and end (so it calculates credit leave); allow request for telework (same as request for leave); include credit leave in the leave category. Currently each Region and HQ program have at least 3 systems to track time & attendance (1. PPL., 2. Lotus Notes, 3. Daily Flex Schedule tracker, 4. Email to manager requesting Telework). When leave is approved by the supervisor, the leave is not reflected in the system for weeks. Since the Current PPL system requires that Agency staff put in their time for the pay period by the 2ns Thurs and managers approve by Friday ??? this causes allot of rework and amendments if	Develop a joint strategic plan that clearly outlines each Agencies area of focus, measurements and targets each fiscal year. Can also establish MOUs outlining priorities, how to conduct coordination etc.
890	889	5/11/2017	Restrictions on addressing climate change prevent us from protecting the economy and the environment. This can be addressed by having senior leaders listen to and take into account independent scientific consensus instead of relying on bias fossil fuel industry interests.	Reviving scientific input into decision making that is independent of fossil fuel and business interests. The mission of the EPA is not to protect business, but to protect the environment in scientifically supported ways.	Letting states, tribes and local communities move forward on any regulations they wish to enact that are stronger than federal standards and regulations. Senior managers may have to cut regulations in the new "back to basics" agenda, but states should not be prevented from keeping or enacting more stringent standards. That is current law. "New federalism' cuts both ways - some states want stronger state rules. They should not be prevented from doing so.	The key part of this question is "while maintaining environmental protection" for all Americans." If costs and inefficiencies are reduced but at the same time reduce environmental protections, then they shoud not be implemented.	Alternative energy technologies should be promoted and given tax credits to reduce both air and water pollution. EnergyStar and similar programs should be promoted more strongly. These kinds of programs increase the efficient use of resources.

891	890	5/11/2017	We should decrease the number of political appointees and build a trusted connection between career and political staff. We need to decrease the number of political staff because the Agency is relatively small, the learning curve for efficiently running a Federal agency is steep, and appointing individuals (senate confirmed or not) is extremely long. Vacant political appointments prevent two way communications from occurring. Career employees can help when they are at the table.	1. EPA is a public health agency and our first concern should be to protect people and their environments. Every person, regardless of where they live, should have the same minimum guarantee to that protection. EPA's minimum standards should be based on high quality objective science, not [state or Federal] political influence. 2. States (local and tribal governments) should have the flexibility to increase the degree of protection but not to lower it. States should have the flexibility to achieve minimum protections in different ways, as long as those methods are determined to be effective. 3. Resources should be provided to governments in a directed manner to achieve specific results. Block grants that can be redirected from their primary purpose should be avoided. 4. Technical assistance should be available to the states upon	1) Technical assistance upon request for urgent and chronic problems. 2) Two way staff exchanges - EPA staff rotating through state, tribes, community, and the regulated community and vice versa. Coordinated rotations should be for no less than 30 days, with specific assignments, and stated objectives. Incentives for participation need to be established. 3) EPA should establish a not-for-profit foundation to identify and distribute non-appropriated resources to states, tribes, communities, and the regulated community to address qualified emergency, urgent, and chronic problems impacting people's health and the environment. Note that the CDC Foundation raised millions of dollars through the Gates and Zuckerman foundations to support West Africa during the Ebola Outbreak. An EPA foundation could do something similar without relying on congressional support.	EPA needs to validate its programs and goals with solid impact metrics and timelines that have milestones.	EPA's innovation team is promoting challenges, prizes and citizen science as tools to rapidly identify and advance new technologies while leveraging Federal agencies, the regulated community, NGO's, and foundations.	
892	891	5/11/2017	There is too much consultation required with headquarters to get things done in a timely manner in Superfund. Also, headquarters staff do not always respect "team" deadlines which further slows down the process.	The state and regional offices work well together on Superfund issues.	Having less internal process from headquarters.

893	892	5/11/2017	Streamline the levels of review. Way back, the ratio of "producers" to reviewers/admin folks was around 70/30. Today that relationship has reversed. Some review of work is obviously necessary but too may levels now exist. The tendency with each level is to find something to add/change/delete that in effect justifies that particular level of review.	Since the states are in the forefront of implementing the nation's environmental laws through delegation, primacy or outright statutory authority, EPA should more aggressively engage them early on the development of major policy/rules/ legislative initiatives. Standing committees of state officials in the several media might help. States are co-regulators so this action should not trigger the FACA. We might also just simply ask them.				There are such opportunities. For example, the administration has placed a strong emphasis on building infrastructure. In EPA's world that affects most significantly the several environmental finance programs in OW. To coordinate their activities, targeting them to priorities, and to improve personnel utilization and introduce more efficient work flow processes, suggest considering the creation of an Office of Environmental Infrastructure Finance. This would include at least, the two SRF programs, which should be merged in any case, and WIFIA.
894	893	5/11/2017	Management in Region 5 especially the Air Division does not treat staff with respect. Some managers yell at their employees and bully them. This behavior is unacceptable and should not be tolerated. Having a supervisor insult their staff creates a hostile work environment and prevents people from being happy at work and doing their best. Oftentimes these issues are brought to upper management and the behavior never stops. It is just "swept under the rug."			Some managers oversee a staff of 3-4 people. This is inefficient and a waste of tax payers money. A supervisor should have a section of 10+ people. Perhaps getting rid of some supervisors and having them work as staff would be a better use of resources.		
895	894	5/11/2017		Organize 50 state "desks" integrating reps from each HQ program and ORD, regional liaison/ops staff to assess baseline environmental conditions in each state and then develop annual work plans/agreements/priorities for measurably improving state environmental quality and health protections	Organize 50 state "desks" or virtual teams w/HQ, regional and state personnel working together.

	895	5/11/2017	The contracting process makes it extremely hard to efficiently procure outside services such that there is a general feeling that it's not worth pursuing. I recognize laws are in place to ensure funds are not funneled to favored contractors, but the outcome of the current model is 1) many EPA employees are needed to oversee and implement contracting processes and oversee the overseers, 2) EPA contracts are only won by the mega-contractors with layers of federal project managers ($$) between the EPA employee that needs help and the actual doer at the firm, and 3) the assistance if often not of great quality because the emphasis is on process not purpose. What would I do? Evaluate the process and eliminate inefficiencies, layers, and steps while ensuring compliance with statute, but provide the ability for EPA folks to acquire outside assistance when needed without the layers of cost and tremendous time/paperwork investment. It would be tedious and unglamorous work to untangle,	Investigate the potential for private-public partnerships in the re-mining of low metal content mine waste. Is there an opportunity for cleanups and resource extraction to occur at the same time? At what point does it become economically feasible to recover tailings in aquatic and terrestrial environments for refining? The U.S. has several large areas of mine waste where economically important metals cause environmental harm (e.g., Coeur d'Alene River ID; Torch Lake / Gay, MI Stamp sands). At these sites, full cleanup is too cost-prohibitive, but the metals are too low grade or too dispersed for industry to pursue. What type of arrangement or cost-share would get cleanup conducted at a lower cost and develop a metals recovery job sector? Another opportunity would be to		Each process (mandatory trainings, contracting paperworking, records management, hiring) layered on front-line employees lessens their efficiency and requires other employees to oversee the processes. It would be useful to eliminate the processes not fundamental to the employee's primary function and reinstate only those required by statute.

897	896	5/11/2017						
898	897	5/11/2017						
	898	5/11/2017	ORD researchers often devise their own research agendas, thus having many individual researchers pursuing individual projects. ORD can identify Program Office, Regional, and State needs and then consolidate FTE to directly address those clients' issues.	View EPA as a client-based, service-oriented organization to a better extent. Identify specific clients and needs, and approach research and policy to assist with them, especially more at the local level with states, cities, and communities.	Allow EPA staff a level of flexibility in their FTE allocation. ORD researchers, for example, are often committed to multi-year strategic plans with specific milestones, outcomes, and deliverables that commit 1.0 of their FTE with little flexibility. For example, allow EPA staff to commit 0.3 FTE to directly responding to customer needs on an ongoing basis, without necessarily tying into a specific research project, but just to assist. Milestones would come after the fact.	Simply consolidate FTE onto specific projects. Too many employees working on their own projects for too long with too much funding. Identify projects, specify amounts to accomplish them, set timelines, and assign multiple experts or allow multiple volunteers to work on them. For example, in ORD, put 20 projects on a board with expected timelines and funding, a hundred employees in the room with 0.7 FTE each to allocate across selected projects, with 0.3 FTE allowed to address ongoing 'customer service' needs.	Online wikis to identify hot topic policy or research issues to which one can contribute FTE. Portable sensor technologies are an emerging technical development that could also be leveraged, but with care and caution, to both directly and indirectly support policy and research.	In the realm of environmental protection, health is related to many inter-competing factors, ranging from chemical exposures to nutritional status. EPA has the expertise to also act as facilitator to identify these health issues and connect with other agencies (CDC, HUD, ATSDR, etc.). Formally allowing some non-regulatory approaches of monitoring, modeling, and decision science to exist within the Agency would help facilitate this effort and demonstrate that solutions can be had outside of the regulatory arena.

900	899	5/11/2017		EPA needs to evaluate both the Kennedy test or the Scalia test in determining if there is a discharge to a Water of the U.S. Simply adopting the Scalia test will not ensure adequate protection of waterways as required by the Clean Water Act. There is no way to ensure that the physical, chemical and biological integrity of our waterways will be protected under the Scalia test only. And EPA using only the Scalia test for a Water of the U.S. goes against a Supreme Court Decision - which seems highly problematic.	EPA needs to ensure that the Carbon emissions or controlled/curtailed in accordance with the Paris agreement and that the carbon reduction goals of the Clean Power Plan, CAFE standards for autos, methane emissions from gas drilling etc. are met. Lest there will serious risks to the public at large associated with Climate Change.	It is much cheaper to protect waters of the U.S. under both the Scalia or Kennedy tests or both which help reduce pollutant and sediment discharges to our waterways. Thereby reducing flooding and water treatment costs. This is cheaper than implementing flooding controls and pollution controls after wetlands have been filled and additional pollutants added. Similarly reducing our carbon emissions will save the U.S. a lot of money in future mitigation associated with sea level rise, drought, intense storms, etc.	Need to promote renewable energy and move away from fossil fuels. This will not only reduce our carbon emissions and reduce the impacts of climate change, but also reduce emissions of mercury, particulates, NOx and SOx. It will also foster energy independence, water pollution reductions, air pollution reductions for generations and generations to come. Seems like a win win win.	
901	900	5/11/2017	Management (on all levels) will not work with, or fire (if necessary) staff that cannot or do not work. I have seen examples of staff and management arriving late and leaving early for a period of several years- with no effort on management's part to stop the behavior. In fact,one man in my branch who came in at 9:30 and left at 2:30 for over 4 years received a year end award! Also, awards and salary increases are not tied to performance, but to favoritism...and the management catchall "we don't want to leave anyone out".	EPA partners fairly well with EPA when we do not assume a "holier than thou" attitude. Follow regulations! If you have ideas other than regulations...they must be "recommendations" with explanations. I also think your question doesn't discuss working with NGO's and environmental groups. They are the public, too.	I have found that better customer service includes being polite, working to find the best answers when asked for help (even if the answer isn't in EPA's purview, try to find out where it is), and telling the truth. If you aren't authorized to help - say so. If there is a regulation that needs to be followed, make sure an applicant knows about it early and assist.	Get rid of dead wood. Teach staff that the American public are our clients. Enforce regulations fairly...and get more enforcement personnel. Take a look at the grants EPA gives. Are they really providing what EPA wants?		I work in the shared responsibility of NEPA. I work with several federal agencies to make sure environmental issues are tackled at an early point in the NEPA process.

902	901	5/11/2017	Every employee is supposed to use a records management program to manually maintain individual emails as records. It would be much more efficient if email records were maintained on the backend at the server level. 20 hours of mandatory COR training on topics that are irrelevant to our work or contract management is a huge waste of time and resources Administrative-type tasks (e.g., travel booking) should be centralized at the Office level so individual staff at higher GS levels do not have to waste time doing it. Information Collection Requests should be renewed on a 5 year, rather than 3 year, basis (especially since the renewal takes a full year to complete).		Less process surrounding web postings to allow timely distribution of technical and support materials. All compliance dates for new regulations should be harmonized (quarterly; Jan. 1, Apr. 1, Jul. 1,Oct.1; See how Maryland has new laws take effect). A summary of all new rules coming into compliance should be summarized on a single webpage.	I've never seen anyone use the vending machines in the pantries. They are energy inefficient and make the pantries less usable because they take up space, are loud and heat up the area.	All regulatory packages should be routed electronically though ADP Tracker rather than through multiple printed copies.	The interagency review process for rule-writing needs to be improved (both at OMB and within EPA) so that the right people are aware of -and cam provide input into- other agencies' actions that relate to our own.
903	902	5/11/2017	The processes we had in place prior to January 20, 2017 were very effective and efficient, and promoted staff accountability. The process changes that have been made by the new political team make it difficult, cumbersome, confusing, less efficient, less effective, and promote less accountability. We should return to our former processes. I hope that the new political team will start to work with career staff as partners, that is the key improvement to making EPA work better.	We have done great work with our state, tribal, local and private sector partners as a matter of historical fact. We are now selectively choosing to make "winners" out of those who bore the cost of regulations to improve public health in the past. This is unfair to all of our stakeholders, who have been increasingly engaged over the years. We should strive to engage with ALL interested stakeholders, not just industry and Republican elected officials.	If the new political team were to accept the career public servants as their peers and partners in doing the work of this Agency, we would be able to coordinate and more effectively and efficiently provide customer service to ALL of our interested stakeholders, not just those that are friendly to the political team.	The career staff at EPA has become an untapped resource since January. If they were viewed as partners and respected for their expertise, they would be able to help reduce costs and inefficiencies that have been created since January.

904	903	5/11/2017	The Integrated Compliance Information System (ICIS) is an important database that tracks actions for NPDES, Air, and RCRA. The ICIS Support Portal includes outdated information; here's the link: https://icis.zendesk.com/hc/en-us Also, the ICIS Helpdesk (icis@epa.gov) receives questions from regions, states, and permittees; they are swamped and more often than not can take months and months to answer questions. Can you invest more funds to update the Support Portal and invest in more helpdesk staff to respond to questions, in a timely manner? That would be so helpful, esp. for new EPA staff.	Give more frequent trainings to staff and public on how to best understand ECHO, as well as clear instructions on how to make corrections to violations shown in error using ICIS.	It would be nice to meet other regional, state, and tribal/communities, in person, via national conferences. Adobe Connect meetings are fine, but would be nice to have face-to-face interactions, too.			
905	904	5/11/2017	The Agency needs to update their databases and technology systems. Nothing is more important than this. The systems we use are antiquated, look to People Plus, it is very difficult to request absences and the software is not robust and does not "talk" with Dept. of Treasury systems. Thus, if you are in medical leave status the codes you enter in PP are not recognized by Dept. of Treasury, this means that your PAY is impacted. The codes have to be MANUALLY changed to match, and I had issues receiving pay delayed over 6 months! The sales force project management is a joke, this needs to be changed. Why can't we use Microsoft office project? I used this in the private sector. instead of purchasing off the shelve things perhaps we need to speak with the employees.	It is very hard to do this in the environment we are working with, budgets are cut and the states are feeling huge impacts. We are funded at 2009 levels and making it very hard to carry out any of our objectives. Furthermore, we need to have open stakeholder engagement we used to have this through an agreement I think with ECOS where we could have citizens, manufacturers, companies, etc. present to discuss "hot" policy issues.	As a federal agency much of our work goes unrecognized until cuts are made, we have to let the communities and public know what we do for them. How much we work for them and the benefits. Coming from the private sector we did this often, we need to better market ourselves.	Don't get rid of the interagency workgroups, they are ideal for implementing policy and influencing others agencies.	ACS, commitment measures and the entire system needs to go away, give the program the ability to track their progress without having pie in the sky commitments that are not really achievable. It is often a guessing game to put forth ACS measures.	Not sure I have the best insight on this issue.

AMERICAN OVERSIGHT

	I
904	
905	As mentioned, project mgt. tools, are needed. I think having best in practice ways of managing and operating from the private sector would help a lot. However, we have to keep in mind that we are not a business, gov't was not set up that way. Inefficiency within gov't is standard due to shared powers.

906	905	5/11/2017	I think everything I do to do my job is necessary	N/A	N/A	More work at home days would allow EPA to downsize again and save on transit. GSA has introduced hoteling so not sure if that is being considered. Consolidating space would save the agency a lot of money on rent and transit.	Not sure	
907	906	5/11/2017	Hard copy circulation for concurrence is outdated and could be streamlined by going fully electronic.	I have found that regular communication and face to face meetings are especially helpful in such partnerships. It would be helpful if there were smaller offices throughout any region so that EPA employees can be closer to our partners. I am based out of the Region 2 New York City office and my state partners at New Jersey Department of Environmental Protection are often not able to get approval for out of state funding. While EPA does have an Edison facility, the meeting space is very limited requiring months in advance arrangement.	We should a more of a presence in their communities - at least at the state level.	I think it would be a useful exercise to examine the necessity of positions for those in GS-14 level non-supervisory position. In Region 2, I know of many employees who would relish the opportunity to work out of existing Edison, NJ facility. Many employees live in NJ and endure one and half to two hour commutes each way to and from the New York City office. Employees whose permanent work location is New York City are not afforded the ability to work out of Edison at the moment. If employees were able to work out of Edison, this would further reduce the really high rent that Region 2 has. Region 2 continues to pay about a million dollars a year per floor despite the IG's report that efforts to utilize real	every employee should have access to adobe acrobat pro so we can sign documents electronically and combine pdfs.	

AMERICAN OVERSIGHT

	I
906	Hoteling seems to be a new trend .
907	Many private sector employees are not paid out for credited for unused sick leave when they retire. We, at the federal government level, should stop this practice moving forward as it isn't conducive to a healthy office environment and potentially encourages people to not take their sick leave. I would suspect that this would reduce costs overall.

908	907	5/11/2017	In my role, the job requires I follow FAR standards, this ensures the Federal Gov't is not held liable for perceived favoritism with contractors and to ensure there is a fair playing field for all. This is a necessary regulation. Although we jump through hoops for equipment and software/tools to enhance our ability to work efficiently, this is more of a budget and resource (computing, etc) need. Having worked in private industry most of my career, I feel empowered more in the federal service.	My area is already initiating and making in roads to provide services (technical services) that can both save money for EPA as well as our constituents (states, tribes, etc...) in that they can use our technical solutions. This requires flexibility in having adequate budget and staff with technical skills.	Please see Question 2.	1. Service Oriented Architecture 2. Flexibility for hiring tech skills in house (contractor burden labor rates do not save the government $, there must be a balanced ratio of government and contractors.	See Q. 2, see Q 4. previously answered -	We do this in some areas already - shared government services (contracts); movement to the cloud. Areas for a further cost benefit may be in centralizing time recording across the government, GSA has made progress in management of space, etc...already. Outside this agency, it seems as if there are redundant services, in particular with investigative services for security clearances - OPM NBIB.
909	908	5/11/2017			There was significant fanfare when the public was asked to comment on regulations that could be eliminated. Fair enough--the regulated communities have a lot of important knowledge (though I suspect that this initiative also generated a lot of extraneous comments). But EPA staff was not asked to contribute to this. I inquired and was actually told that EPA staff are not requested to contribute ideas. That makes no sense. Lots of EPA employees have worked on EPA regulations over the years, and they are likely to know about useful examples, if asked. Sure, employees can contribute in their spare time from home, but there can be logistical problems. Why not just send a note down the normal chain of command so that Division Directors or Branch Chiefs ask each employee to contribute ideas for that initiative. You could even make it a contest or at least have an award

910	909	5/11/2017				Provide or allow use of password managers to create and manage passwords for all of the various websites etc. that employees use in the course of business. Minimize the number and frequency of pushed software updates and passes that cause for lost productive work time in running and restarting computers.		
911	910	5/11/2017	Intranets: Currently each region and HQ office manages its own intranet site. The options for hosting these sites ranges across at least three platforms, maybe more. The methods used to develop and manage the sites varies according to available resources. HQ offices tend to have more resources than the regions for this kind of support; I think the regions struggle to maintain useful, local intranets. I feel strongly that this area of internal infrastructure and communication is inefficient and uses a lot of staff time that could be devoted to other needs. For example, some regions are moving long-held, internal content out of Lotus Notes and into SharePoint, or into a plain web server, or into a locally-managed Drupal content management system. The person(s) doing the moving are figuring out the processes as they go. I see two major issues here: lack of				Open source content management systems for online, internal communication (e.g., Drupal)	
912	911	5/11/2017		EPA needs to invest in staffing resources, software, and contractors to help us manage the wealth of data that EPA collects from the environment. Much of this data is difficult for the public to understand and access. EPA should move into the age of information technology and start sharing all the factual information we collect.

915	914	5/11/2017	One thing that is common across government is that it takes too long to get the smallest tasks done. A good example of this can be found with grants and contracts. One way of addressing this is to seek out other Agencies with similar contracts in place that will address your organization's needs. If it is so, work towards a joint inter-agency agreement. This would streamline the process and limit many of the administrative hurdles often times when trying to achieve contracts approval. The overall benefit would be a reduction in cost which translates into savings to the taxpayers.			A lot of the IT systems that we use here at the Agency can be upgraded to leverage the latest technologies available. These more intuitive and cost effective - to operate- IT systems would equip EPA staffers with the necessary tools needed to perform their jobs more quickly. This would result in an overall better use of FTE resources.	Yes there are new technologies such as many of the software as a service (SAAS) offerings with particular emphasis on the Microsoft ecosystem. This offering would work well with EPA especially since we are currently an Outlook based and SharePoint shop.	
916	915	5/11/2017	Management Procedures - If the Administration wants to implement change, Senior Executive Service employees must be managed as serving in their roles at the pleasure of the Administrator. Some SES members would run over their grandmothers in pursuit of the end of year bonus. The Administration can incentivize the SES to implement cost saving priorities, but they will be reluctant to give up their own turf. When pursuing change and relying on the SES corps in EPA, the Administrator must be willing to take on the dead-enders, bitterly clinging to the past and who are waiting in hopes of January 2021. Removing a few underperforming or recalcitrant SESers from their posts, will quickly make the necessary statement.					

AMERICAN OVERSIGHT

	I
915	I am not aware of any precisely but we can step back, take a broad look at the many program and regional offices, have a close look at their lines of business and assess what they do and how it can be either eliminated, consolidated, or achieved in a completely different manner. All of this, while working closely with the states to ensure that we are meeting their needs and remaining the environmental stewards that we have been tasked with doing.
916	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
917	916	5/11/2017	The Agency's grants management system is outdated, not user-friendly and sometimes not accessible. The Agency needs to be provided with the resources necessary to complete work on the new grants management system currently in development.	In my experience, EPA's management and staff are very focused on developing and sustaining strong partnerships with states, tribes and local communities that promote strong environmental results. The Agency also builds strong, mutually beneficial partnerships with those in the private sector who value economic growth and environmental protection and stewardship. The Agency will continue to achieve environmental results in partnership with states, tribes, local communities and the private sector if we have the staff and resources necessary to maintain our partnerships. The current uncertainty about EPA's priorities and our ability to provide adequate support to our state, tribal and local community partners does not help us achieve better environmental results or maintain effective partnerships.	To provide the best customer service, EPA needs a workforce comprised of women and men with diverse backgrounds and experiences. We need people who are able to communicate effectively with leaders, individuals and businesses in the communities we serve. We also need to have time to communicate with the people we serve. Continued cuts in staffing and resources impairs our ability to provide good customer service.			
918	917	5/11/2017				Please, please, please invest in additional labor employee relations staff to help first line supervisors deal with low-performing employees. They are very helpful, but so backlogged it can take months to address a problem. We need them! No need for RIFs ??? just help us eliminate lowest performing 5% of agency. There are plenty of people not earning their salaries. We would easily pay back investment with increased productivity and saved salary dollars from holding employees accountable for their performance. Managers need LER support to do this. May we please eliminate MaxiFlex? The amount of accounting required, not to mention the lost

919	918	5/11/2017		Invest in tribal youth to care about the human health and environment AND have the skills to back up a career in managing their own healthy environments (i.e. through universities, job training internships, etc.).	Honor the Federal Trust Responsibility the US Government has on behalf of the tribes - to an equal (if not even higher!) standard than the general public, not less.	Better train EPA staff on how to work/engage with HR and Admin in tandem with technical IT training for the many resources we all have but master at different levels (i.e. using things in real time, rather than theoretical PowerPoints).	Make things even more "green" to use them more efficient (i.e. solar panels, more green roofs, more permeable surfaces, higher composting and recycling rates).	Require communication across the "silos", particularly where there are synergies between program areas (i.e. where land affects water affects air affects pollutants). Similar for common services across offices (if not done already - communication for the rest of us so we know how other offices work/operate/function).
920	919	5/11/2017	Printing and signing forms that could be signed and sent electronically with the technology we already have in place.			Require employees know how to use basic technology available to them, such as Excel. Employees seem to waste a lot of time manually processing information rather than using basic functionality (such as tables, or sum) in Excel. A lot of employees also don't seem to realize that their process is more complex because they don't understand how quick it could be by using the technology tools available.	Accessing basic agency applications while remote on a mobile device is awful. For example, trying to put an out of the office message on from your phone (if you are unexpectedly out - and after having to go through dual authentication, then workspace login) is ridiculously difficult. You also cannot access EAS, FPPS or Concur to approve documents.	

AMERICAN OVERSIGHT

	I
919	Standing meetings, with agendas, set up with advance for people to prep, templates, a CLEAR guidance and who does what when and how so efforts are not wasted/duplicated, follow-up, points of contacts for questions, get these kinds of lessons learned (positive and improvements).

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
921	920	5/11/2017	Management should get rid of all CFC-related events. These events are not necessary for raising money for the Combined Federal Campaign (CFC) and are a significant drain on staff time. In many EPA offices, one person is designated as a CFC coordinator that creates and coordinates fun events (like office volleyball games or brownie bake-offs) for their colleagues to participate in and donate money for the CFC. These events are fairly frequent during the CFC season and people in each office often feel pressured to attend the many events and donate money. It is not necessary or appropriate to use staff time to raise money for the CFC, which is a voluntary program.	Continuing to participate in a dialogue with these many stakeholders.	Change the EPA website to make it more user-friendly to the public. Many of the websites are geared toward the regulated community (like businesses), but they are often confusing to the public at large. The website should be better engineered towards key search terms and phrases that are commonly used on Google.	One great program that EPA had under the Bush administration was the Sectors Strategies program. This program was housed in the Office of Policy and created a key point of contact for each sector. The POC's job was to ensure communication flowed across the agency so that any regulations or programs that affected that sector coordinated and ensured that they did not conflict. They also provided a single conduit of information for the regulated community in that sector so that they heard EPA with one voice, not multiple voices with conflicting messages.	EPA needs an app! An app for smartphones that allows the public to find out the water quality (both water for drinking and recreation) in their community, pollution levels on hot days, safety of local fish for consumption, and places to take their recyclables. There might be an EPA app for businesses that helps small businesses comply with regulations, like information on where to take their used oil or other hazardous wastes.	We need to make sure that dialogue and communication is encouraged between the agencies. Shared websites and information resources would go a long way to ensure consistency between agencies. See www.cicacenter.org. Websites like the Construction Industry Compliance Assurance Center could be further expanded to include more information from states, local governments, and other federal agencies (like OSHA).
922	921	5/11/2017	1. EPA has decentralized various functions with the idea that individual EPA staff should be expert in and expected to complete all manner of administrative functions and online systems. It does not make sense to have professional staff at relatively high salary grades spending time on matters such as travel authorizations; these matters should be handled by administrative staff. Moreover, the vendors for these systems are changed on a regular basis so by the time people finally understand how to use them, an entirely new system is put in place, which is extremely inefficient. 2. Our automated systems for tracking the hours employees work, flexiplace authorization, and leave requests should be fully integrated AND processed at the END of the pay period. Currently these systems are not integrated and are processed before the end of the pay period leading to unnecessary time spent inputting data into redundant systems and revising hours worked and leave requests.		Provide additional EPA staff and funding, rather than cutting the EPA's budget, so that we have adequate staff to conduct the immense workload we already have in house across all programs. For example, we have limited staff to issue and oversee the state issuance of permits. Increase, rather than decrease, budget and staff for EPA as well as state enforcement of our environmental laws so that we can ensure that businesses and individuals who play by the rules and comply with the law are not put at a competitive disadvantage by those who violate the laws and get away with it due to underfunded enforcement programs.		EPA needs to find a way to better automate searches through electronic documents, particularly email, in response to FOIA requests and discovery requests.	

AMERICAN OVERSIGHT

	I
921	This agency badly needs standard operating procedures (SOPs) and standard templates for talking points, memos, and other commonly generated documents. Too often, our offices develop new processes and procedures from scratch, when a standard process/procedure could be implemented so that new ones do not need to be developed. Standard templates for commonly generated documents should also be developed and required for use, similar to those used by the Department of State. This will create a consistency across the agency and prevent employees from developing new formats for information or generating documents that do not
922	

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
923	922	5/11/2017	Style Manual ??? A few years??? back, the agency started using the AP style manual that mandated putting an article in front of (the) EPA, not defining acronyms in brackets, and a few other odd rules. Generally, this makes the writing harder to read, acronyms harder to find and writing less clear and frequently annoys external stakeholders such as OMB. Suggest the EPA go back to using the Plain Language guidance that it used previously. Mandated Presentation Format ??? A few years??? ago, the agency was directed to use a standard Powerpoint template with a big green swoop at the top. This proved to use a lot of ink, be harder to read and inhibited clearly displaying charts and graphs, which are the primary purpose of Powerpoint. Most organization over time simply stopped using the format, but many are reluctant to stop without formal permission. Suggest the Chief of Staff formally rescind the directive to use a rigid template. Systems Planning ??? There appears to			Look at untapped systems capabilities ??? EPA has dozens of IT, administrative and financial systems many with duplicative capabilities and functionalities but many also with untapped functions and capabilities. The agency could potentially leverage a lot more of these capabilities if we ask systems experts ??? what else can this system do that we aren???t using? Then we can look at how we might modify processes to leverage those capabilities. Traditionally, planning tends to go the other way ??? organizations write requirements that we they shape the systems around. These might not always be new technologies but they would be a new way of using them.	CMS ??? The Correspondence Management System (CMS) appears to have the potential to streamline work but in actual use seems cumbersome. Suggest a small users group look to see what modifications might help its usability and maybe look at Dept of Commerce???s system as an alternative.	The agency uses many common systems along with other agencies ??? procurement, financial, administrative, etc. Many have user groups that have gotten stale through time. The agency could propose a combined federal effort to target a few areas, maybe beginning with procurement and financial given the importance of these systems to the DATA Act.
924	923	5/11/2017

925	924	5/11/2017	The Agency's Working Capital Fund/Workforce Support Budgets are not adequately funded. EPA should fully fund needed IT equipment and infrastructure. EPA is unable to replace laptops when warranties expire.	Maintain strong state oversight: Continue to conduct program reviews and share best practices across states. You need effective regional offices to deliver these services. Make sure that cuts are not prorated in such a way that the smaller regions do not have sufficient staff to manage. There is a minimum size below which staffing should not go in order to have a viable regional office. Continue to allow Indian GAP funds to be used to implement programs in Alaska. Continue to fund programs to deal with waste issues in rural Alaska. Continue targeted work in communities along the lines of Making a Visible Difference.	Maintain strong EPA regional offices, that build partnerships with these stakeholders. Ensure consistency in how we apply the regulations across the country and continue a strong enforcement program. Responsible companies do not want to see irresponsible companies getting away with not doing the right things.	Lean the process for awarding grants and contracts at HQ. Critically examine the Human Resources Las Vegas Shared Service Center. It has not worked well, and hiring is hugely inefficient. They are unable to retain good staff, and they have an extremely highly graded, inefficient structure. We would be so much better off returning those resources to the Region.	The entire hiring process is inefficient. Devote resources to leaning the hiring process. Standardized Position Descriptions and Recruitment Packages have been helpful, but not all HR Shared Service Centers use them. We might be better off without the Las Vegas SSC.	The hiring process involves OPM and other federal agencies. It could be made much more user friendly and efficient. The biggest opportunity, however, is in working with EPA's Shared Service Centers.
926	925	5/11/2017	We could see less of the great accomplishments of our great leaders President Donald J. Trump and Administrator Scott Pruitt touted on the website and other places like social media. Their greatness is a distraction to my work, here I am midcareer and I will never be able to accomplish a fraction of what these men have in their lifetimes. How am I, the average worker, supposed to feel when I compare what these great men have done in just 100 days to what I have done in over 10 years at the Agency. What I have done is a pittance in comparison!	We need to listen to the states, they have needs too and don't always have the experience, staff or other resources to get the job done. In my work they have asked EPA to help support their work and efforts. The agency has help to be a facilitator of conversations and dialogues that help all states to solve problems that are common to all states in our region.	Get good information to people the first time, via the website. In my program we refer many of the comments and complaints back to the states and local health departments as they are local issues not federal issues. Everything that I've worked on has had heavy input from the states and industries that are effected, I don't know what the administrators beef is with the way that we did things.	I think that the administrator's request for 10 staff for 24 hour security could be declined in the budget. That would reduce costs, and the amount of public affairs staff that I perceive as sitting around with nothing to because of the focused messaging on the administrator's self perceived 'successes' could be let to do their old work again. That would be a more efficient use of staff. Looking from the outside of the agency in, it's really developed a cult of personality like we've never had before. Environmental protection is more than just this 'cooperative federalism' that the administrator touts and shining the love on coal miners, it's about people's health.	Wind, solar, biomass, energy and manufacturing efficiency, these are all modern technologies that will make things more efficient, effective and accountable.	Everything that I work on is a shared interest with other federal agencies or states, I don't understand how people could think otherwise? Unless they hadn't taken the time to learn about the agency and the processes in place. Read a federal register notice and see what's in there, how all the comments are addressed, how the economic benefits are address. This has all been required before by previous administrations. People need to be willing to listen and learn before speaking.

AMERICAN OVERSIGHT

	I
925	The Air Advisor Program with the US Forest Service deploys trained EPA staff to wildfire events. EPA assists with monitoring, modeling, and communication of risks to communities, so that people can protect themselves from smoke. We could make the process of reimbursable funding more efficient, but other than that, it is an excellent program in support of the American public at risk from forest fires. The West Coast Collaborative for reducing toxic diesel emissions is a fantastic model of how EPA can work across the public/private sectors.
926	In a lot of ways the private sector is just as messed up, maybe in different ways, than the public sector. But, you don't always here the stories because they don't have some junior congressman looking to make a name for himself.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
927	926	5/11/2017	We should not be changing delegations so that the Administrator makes decisions that were once made by the Regions--this drastically slows down work getting done. Requirements for EPA staff to clear any public statements through HQ are burdensome and unnecessary. I also find myself spending hours doing administrative tasks. Our office does not have adequate administrative support.	Maintain or request additional funding for EPA programs that support the development and expansion of local, tribal and state capacity in enforcement and implementation of federal environmental laws is key.	EPA should commit to transparency in decision-making and decision-making based on sound science and the rule of law. Decisions should always key back to our central mission, protecting human health and the environment. EPA needs to do a better job communicating the vast and multi-faceted economic benefits of our regulations, which has led to the mistaken belief that EPA is a job killer.	Effective and adequately funded enforcement can reduce costs by increasing compliance; non-compliance in the industry leads to increased costs to the agency from having to respond to accidents, releases, spills, etc.	We need better IT support and updated software and adequate training on new software. This would assist in responding to FOIAs.	
928	927	5/11/2017	Delegation of authority should be rendered for all areas where this is at all possible. Generally speaking, no more than two levels above the author need or efficiently should be reviewing a document. Now of course, for really high level stuff this does not apply, but for normal day to day work it should. In my opinion, EPA has too many reviews of a average document, which can hold up progress on a project because an approval might have to go thru too many levels of review. I have previously worked in lower and middle management capacity, and as a manager, I know that if too many people look at the a document by the time everyone has made their changes it can ending up looking like the first draft, but after wasting days of review.		We should be more transparent with our documents, etc. I don't believe this is a symptom of staff not wanting to be, but that we do not have the software/databases or staff time to be more transparent. SEE Q 5		I have worked for several different government agencies and private consulting firms and must say that the lack of investment in updated, comprehensive software/databases is disappointing at EPA. We are literally over 10 years behind in technology from other GOVERNMENT agencies I have worked for. EPA is wasting a lot of taxpayer money by piece-milling so many different databases and tracking mechanisms for each different program, which is then different at each Region. As with other agencies, ideally there should be one database that has different subparts tailored to each program, not only as a document depository, but also as a tracking mechanism. This system should have the ability to allow outside

927	Top law firms and major companies may be helpful in assisting us with better records management and data management, particularly in the era of electronic discovery.
928	Yes, there is a lack of administrative consistency throughout the agency, which makes us more inefficient than we could be. SEE Q 5.

AMERICAN OVERSIGHT

	A	B	C	D	E	F	G	H
929	928	5/12/2017	I fell there are too many "required" training courses, seminars, overviews for an staff worker and a manager to track. A large portion of our time is spent taking annual or repetitive training such as: sexual harassment, Cyber Security, Tribal, Transit Subsidies, Time and Attendance, Travel, etc. Furthermore, even after taking these courses there is time required to enter them into data systems or manage the tracking of such info manually. Many systems are not even user friendly and require time to understand how they work.	I do not believe we need to achieve better partnering. To me "partnering" has taken a connotation that there will cannot be disagreements or disputes. This is fundamentally wrong. Each stakeholder has their own agenda and perspective, whether that is EPA, the State, other Federal agencies, tribes, local communities or the private sector. We each have our priorities and therefore there will be differences of opinions and goals. There is nothing wrong with that. It is through the collaborative efforts that a working plan or goal is achieved.	I think you first need to ask the public what issues they have with EPA and the service they receive before asking EPA how we can make it better. There are already community meeting, advisory groups etc in which the public and other stakeholders can provide input. You need to ask them what they require.	Consistency in regulations would help. However often times there is a disconnect between Federal and State requirements which make implementation of various remedies or actions difficult. I also think the other Federal Agencies should stop disputing EPA regulations. They often try to circumvent steps in the process which creates difficulties later in the process. Also their mentality that "one size fits all" does not work. Sometimes when some "latitude" is granted or provided, they use that latitude to be applied for every situation even when the situation does not dictate it. Then it becomes a battle to justify why the latitude was granted at one	Whatever systems we are asked to use, they must be user friendly. Many are not straight forward and require training and repetitive applications or usage for someone to use them efficiently. They are created for everyone as if everyone will have a deep understanding of the system and their job depends upon it. However many of the systems require use maybe once or twice a year and the knowledge gained is often forgotten over the months.	I think this is no believing realistic. States do not have the resources EPA has. Many state counterparts ask EPA for assistance in the areas of enforcement since EPA has the resources and greater expertise. If one is trying to "increase" the economy or the private sector, then some States which have "more stringent" requirements not less may inhibit such growth?
930	929	5/12/2017	Correspondence prepared for upper management's signature is typically printed and placed in a folder so that it can be manually concurred on by the originator up through the party that signs the document. If any of the parties concurring on the document have any edits, the folder needs to be returned to the originator and the document and file copies need to be modified and replaced. To save paper and time, it is suggested that all such correspondence be circulated, edited, and concurred on electronically with the document being printed final only when the party that is signing the document has concurred.

931	930	5/12/2017		Re-assess the regional structure and reduce the "Regional office" size by creating smaller field/operational offices in more locations instead of having a large regional office located in expensive cities. More thoughts included in #4.		Look at the current regional structure to determine if there are opportunities to restructure that would consolidate administrative functions and create more field locations and less masses in regional office. For example, do we really need 10 ARA positions for management --- contract function should be returned to OARM and the number of ARAs for management could be reduced to three where they serve that function for many regional offices (east, central, west). Another option would model after Region 10 -- have field offices in various locations placing employees closer to states in less expensive space and therefore lead to smaller footprint needs in the main regional office.	Why hasn't EPA migrated its time and attendance process to the Interior Business Center. OCFO continues to spend money on PeoplePlus when we could be serviced by another agency in a more efficient manner. EPA doesn't need to be in the business of time and attendance. Payroll and HR functions have already been migrated to IBC and as I recall the original intent was for the agency to also migrate it's time and attendance processes. What changed?	EPA migrate time and attendance function to Interior's Business Center.
932	931	5/12/2017	Computer access - currently we log into the EPA computer system with our smart card and pin - once into the system, we then have to input various user names and passwords to access various applications. This results in a lot of wasted time having to insert different user names and passwords, keep them current, changing them at different time intervals, etc. The EPA computer system should be reconfigured so that once you have logged into the system you do not have to use any other user names and passwords for any of the EPA applications. Single Sign On is suppose to fulfill this function but it is even not needed if the system is reconfigured as above. Time cards - currently we are required to complete our electronic time cards prior to the end of the pay period. This results in employees having to prepare time card amendments due to changes of work schedule at the end of the pay period due to changes in work activities, leave, etc. Time card amendments

933	932	5/12/2017	At my current position, I am constantly busy and deal with a lot of work. What prevents me is the open space where I sit, that I am constantly being interrupted. But the one thing that would also be great to have a higher grade and pay. The amount of work I do, both grade and pay does not cover for all that I do.	None at this moment that I can think of	none at this moment that I can think of	Our agency works extremely hard to keep the environment safe.	Yes to update all computers and programs to current modernization.	none at this moment that I can think of
934	933	5/12/2017	It would be great if we had administrative staff to help with the menial tasks, so we can concentrate on the actual work. There is way too much back and forth with concurrence's- especially when your director works in NYC and you are in NJ. It takes too much time doing it with paper, this should be all done electronically.	We work with the states and give them grants for the inspections they have primacy of. So, it would be a shame if we cut their funding by 33% - I don't think they will like our partnering anymore.	I have great relationship with our SLA's. However, we had a new regulation about 5 months into implementation and a FR notice will be sent out to possibly change elements, along with implementation. This does not help our relationship with the SLA's or the regulated community. In fact all the hard work reaching out to the regulated community, changing websites, creating materials - we now have to start over. Both the SLA's and the regulated community are not happy. They could have created a 1-2 year period of compliance assistance, without making all upset and frustrated.	I have been working here for 20 years. We are as bare bones as we have ever been. We have limited funding to travel to even complete our tasks, nevermind when public health threats happen and the need is there. We have one printer for about 20 people. No access to funding for printing, even when HQ has stopped printing materials completely and we need to print in order to send stuff to our SLA's. I think the biggest inefficiencies are the staff that do not do contribute to the teams success and are of retirement age, so no one puts pressure on them. We should be able to fire people that do not pull their own weight.	All the databases created at EPA are from the lowest bidder. SO this is an area we can improve on. Also, it makes no sense that the Virgin Islands and Puerto Rico are part of Region 2. They should be given to CEPD or R4- to make travel and better oversight easier.	We currently work well together.

AMERICAN OVERSIGHT

	I
933	To reduce cost, employees should travel less, due to updated technology of VTC etc. no need for travel.
934	We need to go electronic for getting upper management signatures. A lot of time it is delayed bc they are too busy. Better databases that actually work would help too. If you cannot get all the information you can before an inspection, it is hard to complete it well. Again, we should be able to fire people who do not complete their job tasks. If they got rid of these people and instilled fear that they may lose their job- it would make the agency definitely more efficient.

937	936	5/12/2017	1 - Streamline Grant Applications. About 10 years ago, some lame lawyers added requirements to repeat information over and over again in different sections of EPA grant solicitations. This is a huge waste of time and paper for all involved. Also, small grants (under $25K) are now subject to the same massive paperwork requirements that large grants of hundreds of millions of dollars. There should definitely be a tiered system to streamline the process and requirements for small projects. 2 - The ACS commitment system is overly burdensome and does not drive the greatest environmental results. Essentially, there is a lengthy HQ/Regional negotiation process of "bidding" and negotiating on projected environmental results (ACS - Annual Commitment System(followed by mid-year and annual reporting. The "game" is to achieve the target number without going too far over which is perceived to mean that the organization has too many resources.	Encourage and reward partners to achieve and report results that exceed projected results and collect and share online and though the media our results/lessons learned so they can be replicated.	Set up a 360 degree feedback system so that in addition to EPA reviewing our partners, they review us.	Add more real time local environmental monitoring systems that are available to the public online with both environmental data and actions that can be taken 1) on an individual level to protect human health and the environment and 2) current EPA regulatory and policy information. Provide web	Publish our annual environmental results information online (ACS) with short lessons learned summaries and set up a searchable wiki-like website interface so the public can ask and EPA can respond to at least some common questions posed.	
938	937	5/12/2017	1. Requiring HQ's oversight and approval of outreach materials at Superfund and Emergency Response sites is inefficient and adds no value given that the information being shared is very site specific and HQ's does not have the depth of knowledge about the site nor what the communities interests are. Approval for development of and dissemination of outreach materials at a Superfund and Emergency response sites should only require Regional/Program approval. 2. EJ has been engrained into every Program therefore having a separate EJ Program is inefficient and a waste of tax payer dollars. Suggest having one internal POC in each Region for EJ questions and consolidation of reporting for each Region and not an entire Program devoted to it. 3. IT needs to be centralized for all Regions and contracted out to allow for consistency in services, efficient use of resources and better access to	Increase oversight of funds distributed to states, tribes, local communities, or the private sector to ensure that the funds are being utilized for the environmental goals that were identified as part of the grant/contract/IAG etc . . . and used in a timely manner.	1. Prioritize community outreach and provide resources to better build relationships with Federal, state, local, tribal, non-profit and private sector partners. Science is a priority but science means nothing if you have bridged relationships to educate to gain support for and collaborate on EPA actions.	1. Regionally centralize outreach efforts to include EJ, CIC's for Superfund and Emergency Response, Sustainability, Children's Health, EE and place them under the Public Affairs Director for each Region. Currently outreach efforts are spread across the Region which creates missed opportunities to broaden educational and outreach opportunities to the public about all of EPA's activities. By centralizing these programs the public can expect a one stop shop of information, better use of personnel time by balancing workload and focus on priorities as well as consistency in messaging. The public doesn't break down EPA in there minds. EPA is EPA. 2. Combine media,	1. Social media, photos and videos! Utilizing newspapers to get the word out is no longer effective and puts EPA behind the message rather than in front of it. Region's need resources and support for social media and need to be able to control it from the Region. It cannot be centralized at the HQ's level. It slows the messaging down which is not what social media is about. The public want to hear more about what's going on in their local world and the Region's are in the better position to do this. 2. Resources to reach out to the public during emergency response efforts. Cell phones, IPADs, printing capability, etc. Not ever emergency response is of national significance in order to justify the need for tools to perform public outreach.	In regarding to shared responsibilities across Federal Agencies - Centralize across all agencies the Human Resources, Employee Development, IT and Administrative Support. There should be one stop shopping for all these support needs and much of it could be contracted out.

939	938	5/12/2017	I have heard many complaints that the STICS database for tracking publications and data in ORD is cumbersome and time consuming. There are also rumors that this system will be going EPA-wide next year. Researcher are supposed to upload all data used in publications so it will be publicly available, but the system can't handle large files including most model results which can take up several terra bytes. While making data public is a good goal, it doesn't seem like the current system is able to handle the data requirements for this endeavor. Many/most journals now allow authors to pay extra to make an article publicly available. We barely have money to publish at all, let alone money to make our article open access. It seems like if EPA were serious about making EPA research open to the public, they would make it a priority to set aside money so that EPA scientists could pay to make their articles open access.			Bring IT services in-house. There are perpetual problems with IT systems and computer hardware supplied by contractors. Contractors have too much turnover, too little accountability, and get paid for service/help requests so there is no motivation to make things work the first time. A lot of time has been wasted due to remote e-mail access not working, new computers no being up to spec and having catastrophic failures within 1 yr of purchase, and EPA firewalls preventing fruitful collaboration with scientists at other federal agencies. New printers were first installed in RTP a month ago and are still not working properly. Contractors have been called over multiple times to reconfigure the	The systems used for pay (currently People Plus), travel (currently Concur), and contracts are constantly changing. It seems like every 1-1.5 years there is a new software system being implemented or our paychecks are being handled by a different federal department. These new systems inevitably have bugs for the first 3-6 months and take time for EPA technical staff and administrative personnel to learn. The effort that goes into constantly implementing new software systems would be better spent on work that helps further EPA???s mission.	
940	939	5/12/2017						OEI went though a re-organization just before the election, even over the objection of program offices in HQ. The reorganization was a ???waste of time and money.??Â The reorganizing took an organization of approx 5 offices and turned the organization into 7. Most of the reorg was to split functions that went logically together. For example, in the old structure, internal communications and management was in one. Now OEI has a management office, and a separate office to handle internal communication would save ten if not hundred thousands of dollars to put the organization

941	940	5/12/2017	1. Use of government purchase card -- FAR regulations and OARM have added so many new restrictions that we're unable to use the purchase card efficiently to quickly make purchases. Purchases that are less than the single purchase threshold are being forced through contracting. It took 2 months to make a $200 purchase that a cardholder could have completed in 5 minutes. Re-examine the rules and regulations to make the use of the card efficient -- which was the intention of the program. 2. Hiring -- There is no federal government standard for declining candidates that appear on the cert. At DoD, if you could write a short justification statement why the initial candidates weren't qualified, you would get the next batch of candidates for consideration. At EPA, HR insists on calling the candidates on the cert and asking them to withdraw their application. Unless that occurs, they won't forward the next batch of candidates. There needs to be ONE federal standard.			1. Some programs are split up into subdivisions to the point where there's duplication of effort and groups with similar missions aren't communicating with each other. Each program office should re-examine the various project teams to determine if there's duplication of effort and combine programs to streamline processes.		1. Terms of service -- GSA should be responsible for establishing terms of service agreements with vendors and should have a central inbox where agencies can submit requests for new vendors. Currently each agency sets up individual terms of service agreements. 2. Hiring standards -- There is no federal government standard for declining candidates that appear on the cert. At DoD, if you could write a short justification statement why the initial candidates weren't qualified, you would get the next batch of candidates for consideration. At EPA,
942	941	5/12/2017		1. Updating the Regional Screening Level Table used in human health risk assessment is almost a year behind schedule, and there is a significant decrease in the potency of benzo(a)pyrene and the other carcinogenic PAHs as a result of IRIS revisions which is not reflected in the currently available RSL Table. All states and EPA regions use the RSLs pretty much on a daily basis, and it is a disservice to both, as well as reducing the accuracy of risk assessments, to not have the RSL table updated on the 6 month schedule previously followed. 2. The states desperately need funds for water infrastructure upgrades to ensure safe drinking water. Increase funding of the state revolving fund so that we can assure the public their drinking water is safe. 3. No state has enough money to ensure that their children in older stock housing are not being

946	945	5/12/2017	Agency-own initiatives would place additional workload for program offices since they would end up implementing the initiatives. Rather, workload can be better shared among offices.	Establishing clear and consistent regulatory and technical requirements, administrative procedures and goals early on would achieve environmental results more expeditiously and cost effectively.	It is clearly communicated early on what regulatory actions EPA will have to make, what are the regulatory, administrative and procedural requirements to comply with, and whether and how any comments and concerns can be addressed.		Improve the effectiveness of electronic files storage and share sites, such as OneDrive and SharePoint site so that they can utilized more effectively and agency wide. Currently, they tend to be cumbersome, slow and not user-friendly.	Establish an agreement with a state on work-share responsibilities where it is clearly identified which sites are the responsibility of federal or state agency. Any actions or cleanups performed under federal or state cleanup programs be also recognized as equivalent to the cleanup performed under other federal or state cleanup programs.
947	946	5/12/2017			Fold OLEM/FFRRO into OLEM OSRTI. It is important that we have a consistent cleanup program for Federal and Private sites.			
948	947	5/12/2017	The administrative requirement to have employees attest and submit timecards prior to the end of the pay period prevents me from doing my job efficiently and effectively. This requirement ensures a significant portion of timecards are actually incorrect when submitted and causes significant administrative burden on employees, time keepers, and first line supervisors in order to amend these timecards in arrears. The Agency needs to revise the payroll process so that employees attest to their time the Monday after the pay period ends and supervisors approve time the Tuesday after the pay period ends.	Currently, the Agency partners with states and tribes in a number of ways with the majority of the Agency's budget allocated to these partnerships. The simplest, most direct way to achieve better environmental results is to improve the data systems which EPA, the states, and tribes use to track the environmental results of their work. Improving data collection and storage will facilitate a sound assessment of areas where results from our partnerships need improvement or are very effective.	The Agency should devote adequate resources to bring major work processes on-line and upgrade existing data management systems. This is one of the most important things the Agency can do to provide for better customer service to states, tribes, local communities, the regulated community and the public at large.	Integrating enforcement functions into the environmental programs they support would reduce cost and inefficiencies while maintaining environmental protections. For example, this would provide the opportunity to have pesticide labels reviewed for practical enforceability before being approved for use thus making compliance easier for the regulated community and enforcement more straight forward for the Agency. It would also make coordination with states and the regulated community simpler and more straightforward. Another untapped opportunity is the opportunity to review Agency work processes in	The Agency needs review it's process for developing and implementing electronic information management systems (i.e. stand alone and on-line databases). Currently, it is difficult, costly, and time consuming for programs to get data systems developed and implemented. Specifically, the Agency needs to revise the current process so that 1) system users control the design and roll-out of a data system 2) the Agency can access appropriate technical expertise in a timely manner to keep up with advancing technology and 3) purposely allocate sufficient resources to both support existing data systems and upgrade outmoded systems. As a first step in this process, the Agency should develop a clearinghouse where HQ and	Within certain programs like Superfund there are established coordination groups, such as the Regional Response Team, which facilitate communication between state and federal agencies. These groups are staffed by GS-15 and lower personnel and generally do a good job of transferring information and fostering organizational trust. However, above the GS level in the Agency there seems to be a lack of similar established inter-agency groups that regularly meet to perform the same general function. This results in operational inefficiencies because when a particular decision or

949	948	5/12/2017	The Credentials process is slow and cumbersome. There is a considerable amount of training for staff who need credentials. All of that is verified by supervisors. Then all the certificates are sent through several layers of staff before going to HQ for more review. The simplest thing can send the entire packet back for the approval process to start all over again instead of an easy update/fix/answer to the person needing the information. In addition, the most recently hired staff who have taken over a year to go through the training and the entire paperwork submittal and finally received their credentials in early 2017 have expiration dates of this year as well. This is ridiculous for those who need credentials to do their jobs. Management is sometimes involved in so much tracking of the details of staff that they have less time to contribute to staff needs. This may be in specific hierarchies rather than EPA-wide. But in my area the supervisors have to track	There should be more transparency with ALL data regarding chemical approvals and reviews - or other experiments, peer reviews, scientific processes, etc. Third parties, and other peer reviewers, should be allowed access to the data from EPA as well as the private sector for the purpose of peer reviews and verifications where the EPA is lacking due to insufficient funds, time, and staff. This would allow a stronger, more accurate, peer review process and help EPA make better decisions. In addition, ALL private sector data, including that which is deemed insufficient for any reason should be submitted to EPA for any chemical, or other, approval process. Data submitted should not be limited to "successful outcomes" only. Allow EPA staff from all areas to live and work in all areas of the	More money for states that have delegated authority. Some do not pay their staff very well (considering their education/experience) or have enough funds for travel, compliance assistance, etc. When this happens, EPA is obligated to step in an help the states. However, that can take time/money away from EPA priorities. In addition, "politics" get in the way at the state level whereby EPA must step in and assist again. If state staff could do their work without the politics getting in their way, there would be less disparity between larger regulated facilities and smaller ones (due to the larger ones having more money and power at the legislative level). This is simply unfair to all regulated entities. This same problem can be seen at the federal level as well. I don't have an idea to fix this, but it is an issue that needs to be addressed at a leadership level.	I suggest EPA leadership work on a better ???fairness factor??Â across the country. When a facility is in violation of regulations they need to be treated the same as others, regardless of who their congressmen are, how much money they have contributed to political campaigns, or their lawyers. Unfortunately, due to politics, it appears that sometimes companies get away with non-compliance or do not have to ???pay the price??Â in an appropriate punishment. This is unfair to companies that are complying (and paying more in costs to comply) and smaller companies with a lack of ???political clout??Â. This also encourages others to violate, as it???s cheaper than complying. Altogether, this makes our environment	Have leadership investigate the State of MI DEQ "MiWaters" program. Something similar would be so much more efficient and effective for staff, and the public, in tracking, mapping, permitting, etc. It is a "one stop shop" rather than the various websites we use now that are not connected. EPA is behind states and some local governments in the use of technology.	HQ and DOJ staff need to get out in the field more, with their enforcement staff and inspectors, to truly understand what is reality regarding the regulated entities. They just don't see the big picture sometimes, or the important details. They are stuck in their own worlds, incapable of seeing the other side. Giving them the opportunities to work with the regions more closely by sending them out to the regions would be considerably more effective. This should mean HQ actually live and work in the various regions, rather than from D.C. More communication, and follow through, in
950	949	5/12/2017	EPA and the US Archive have, for the first time ever, created duplicate websites that preserve the White House and Agency sites the day before President Trump was inaugurated. The reasons given for this is to reduce the number of FOIA requests, but I question whether or not the demand remains high so long after the initial outrage around the president's inauguration. Also, we are violating long-established web policies that discourage duplicate web content, and we are causing confusion and suspicion even among savvy web users because of it. For example, I found the snapshot while searching the internet for pesticide information. The red banner across the top doesn't load as quickly as the rest of the page, so I'd already scrolled down and didn't realize I was in the duplicate site. The information I found was outdated, but I didn't realize it until later. I also received an inquiry from the Oregon Department of Agriculture asking about a water quality standard that changed between the snapshot and		Eliminate duplicate content from our website that confounds internet searches, including the January 19, 2017 Snapshot, as well as all web material that is outside of our specific area of expertise.	One of my tasks is to respond to correspondence (i.e. letters, emails, and webmails) from stakeholders for the Office of Pesticide Programs. Pesticides are controversial, and we are positively buried with letters of complaint from people who have invested no time reading through the extensive material we provide on our website. We get buried with 'click-to-send' and postcard campaigns demanding regulatory action, as if pesticides are regulated on a quasi-democratic basis in which the loudest people shouting decide for everyone else. More recently, we have been inundated with interview requests from 3rd grade to university graduate students whose teachers and		Ensure that EPA is not providing information on its website that is outside of our specific jurisdictions, and that we are not competing with other federal agencies on identical topics. For example, we have thousands of web pages providing information (some of which is demonstrably inaccurate) about bed bugs, zika, mosquitoes, etc., when our actual area of expertise is regulating pesticides that are used to mitigate these things. Some of our information is demonstrably wrong (e.g. the page covering state and local laws pertaining to bed bugs), and the CDC has even more content than we

951	950	5/12/2017	The new layer of review and deep skepticism about our current work by the new administration prevents us from doing our job efficiently and effectively. Several matters have been scaled back or abandoned by the new administration, without regard for their established merits, thus further preventing us from doing our jobs efficiently and effectively. Key legal authorities that allow us to protect public health and the environment have been abandoned or diminished, contrary to the law, thus further preventing us from doing our jobs efficiently and effectively. The new administrator and president have repeatedly accused EPA staff of violating the law, taking people's property, and harming business, all without evidence, thus demoralizing the staff and reducing our efficiency and effectiveness. The new administration has diminished our proper role in overseeing the state programs, insisting on greater deference	Fully embrace our authority to protect all Americans and our environment from pollution by insisting that all states comply with federal standards in their implementation of environmental laws, and not walking away from our responsibility to do so. Provide greater funding and technical assistance to states, tribes, and local communities to help them develop the capacity to fully implement federal environmental standards and improve environmentally protective infrastructure. Send a clear signal to the private sector that the protection of public health and the environment are a priority and create a level playing field for good private actors by punishing those private actors who violate federal environmental laws. In addition, the new administration should stop playing favorites to industry at the expense of public	The states, tribes, local communities, and the regulated "community" are not our customers. The public at large is our only customer. See above suggestions about better enforcing federal environmental standards to protect public health and the environment and providing adequate funding and technical support for states, tribes, and local communities.	Keep the Clean Water Rule, in order to reduce uncertainty in enforcing the CWA, and the attendant additional costs and litigation risk. Keep the Clean Power Plan, in order to continue the ineluctable transition to a clean energy economy, and avoid the additional costs of changing direction and then, ultimately, returning to the right path once this administration is gone in less than four years. Defend all rules that reduce pollution and protect public health, and continue to follow the command of the various environmental laws to ratchet down the allowable levels of pollution, with a goal of eliminating all pollution possible, to make American great.	Restore science and the law to their rightful roles as the basis of all agency decision-making, restore all deleted/removed scientific information that is unfavorable to the current administration's mistaken view that climate change is a hoax, reveal all meetings that the administration, including the president, has with lobbyists and other stakeholders in order to restore the public's confidence that the agency is working for them, and not for moneyed interests.	This question is incomprehensible.
952	951	5/12/2017	Reporting the same, or similar, information to different levels of management in different formats is highly inefficient. There should be one or two formats selected that all levels of management are required to use. An automated system, such as Region 4's "Superfund Activities Management System" (SAMS), should then be adopted and used by all to generate these standard formatted reports. Such a system can also be directly accessed by those that might need information quickly, such as the press office or Administrator's Office. No need to send out requests that ask for information that has already been reported.	(1) Strong oversight of State programs is the only way to ensure that better environmental results will be consistently achieved. Without it, states will sometimes divert dollars to other things or succumb to political and economic pressures that may conflict with environmental results. With strong oversight by the EPA, the states (and tribes) can take the lead on more activities without compromising results. (2) We need to maintain a viable enforcement program with predictable consequences for violations. This is where the private sector comes in - large entities are motivated by the desire to keep a clean record; smaller players are motivated by a desire to avoid fines.	Customer service can be resource intensive. If our workforce is significantly cut, our ability to provide customer service will be reduced. Assuming we do delegate more to states and tribes, good reporting systems are needed if EPA is expected to be responsive to questions from the public, elected officials, etc. It is highly inefficient to expect staff to hunt down answers on an ad hoc basis when questions are asked.	I have never worked in a non-program position, but from my perspective, we have too many people working in such positions. We should put more of our resources on the front lines in the programs. This includes looking at HQs staffing levels and possibly reassigning FTEs to the regions.	Due to our variety of work schedule options and growing use of telework, we need to put some kind of electronic system in place to keep up with who is "on the clock" and where they are. I don't know exactly what is available, but PeoplePlus is not sufficient for this purpose.	Possibly with contracting. I note that we already use shared service centers for travel and Human Resource functions, but it is not clear to me that resources were saved, and customer service has generally declined when these activities were centralized.

953	952	5/12/2017	Currently. electronic time cards must be submitted by employees prior to the end of the pay period, requiring the last day's work information to be an estimate instead of fact. Consequently, corrections must be made several days after the pay period closes if the data for the last work day differs from the employee's estimate. Time spent by employees to make after-the-fact corrections could be eliminated if time card submittal were to happen after the pay period ends. The five tier performance appraisal system would be simpler and easier for managers and employees to use if it were only 4 tiers. While the vast majority of EPA workers are skilled, dedicated professionals, our agency, like every other organization has poor performers. The process for removal of poor performers should be made shorter and less complex, while preserving vital due process rights.	Recognize that EPA is the preeminent environmental research organization the world, and that states, tribes, local governments, and foreign governments all rely on our research to set standards and develop policies. The proposed massive cuts to EPA's research and development budgets would cripple environmental and public health protections at all levels					
954	953	5/12/2017			Stop hiring introverts. Hire people who actually like and want to talk to people. Not everyone is cut out to do customer service and I am afraid, we have too many of them.	The Controlled Correspondence Process is broken. As many as 25 or more people may write, edit, compile, process, and carry a file folder for a simple piece of correspondence. Way too many people are involved in the review process. Combine OCFO and OARM Stop hiring people just because we have vacant FTEs. There are countless employees who are underutilized or bored doing less than 2 hours of work a day. Their work is project-specific, seasonal, or simply does not require the level of effort that their managers believe or have been told it takes to do the work. You could easily get rid of 1/3 of the people here and function just as effectively.	SharePoint is not universally accepted, nor ideal.	. Transfer some of our energy-related work to DOE. Eliminate OITA - Transfer resources to USAID or State Department

955	954	5/12/2017	In the Office of Pesticide Programs registering pesticides is a core component of our jobs and providing clear and consistent product labels is critical to our success. The way a label review is conducted is the same today as it was 30 years ago. The best investment of tax dollars for this program would be to support the "Smart Label" effort and to provide funding so it is fully functional. This will allow for greater efficiencies on the Product Management Teams where staff can review labels much faster and ensure consistency. This will also make the review process in the supporting divisions more efficient since the labels will be clear so the assumptions used in risk assessment will be realistic and not open to interpretation.		Train staff in customer service and make this an accountability measure.	I work in the Office of Pesticide Programs. At one point the office had approximately 1000 employees. As the increase in staffing occurred many divisions created a second position for a deputy director or assistant director so that there is a division director and two deputy positions. Now that the office has been reduced in size considerably I question the need for divisions that now have staff numbers below 100 people to have two deputy positions. I think these positions could be eliminated and deputies be reassigned to fill the many vacant branch chief positions. The program seems to be placing an emphasis on filling all the management positions and leaving vacant many staff	Spend the money and support the "Smart Labeling" project in the Office of Pesticide Programs. Modernize the data storage in OPP - do not take away Lotus Notes until there is a system in place where reviews can be retrieved and stored so they are easily found in the future. The plans to take away Lotus Notes and to rely on Documentum where reviews cannot be sorted in anyway will make this program even more inefficient and will be very disruptive.	
956	955	5/12/2017	I. The FPPS system for processing personnel actions. Outdated and should be replaced. another federal Agency must have a better system than this. 2. EPA Quality Assurance Field Activities Procedure (QAFAP-CIO-2105-P-02.0) All ten regions and 6 HQ AAships were required to develop their own management system to implement this procedure, instead of having one uniform management system across the entire Agency. Should not replicate this for future endeavors that are Agency wide. have one system for everyone to use.	EPA has excellent field resources (sampling, analytical, quality assurance) that states could take advantage of but for whatever reason are generally reluctant to ask for.	List EPA' capabilities to support States, tribes, etc. on out EPA.gov website.	Too many positions in Washington DC; would be better utilized in the 10 regions where the day-to-day interaction with states happens.	Use tablets to conduct field work and upload results directly back into Agency systems to update data systems, create reports.

957	956	5/12/2017	To me, the biggest administrative hurdle I face is that headquarters approval is necessary for a lot of actions and decisions taken by the Regions. This puts a lot of onus on HQ and a lot of time is wasted in resolving issues. I believe Regions are quite capable of making informed decisions and as long as guidelines are clear and are being followed, Regions need to be delegated these authorities. This will save tremendous time and free up HQ for more important tasks at hand.	Periodic meetings and interactions will help forge better relationships. I believe where the states and private sector struggle is the lack of proper guidance from EPA regarding rule implementation, and NOT the rule itself. EPA should make it a point to disseminate implementation guidance faster and be very clear and precise on what is expected from the States and private sector. I have found that Industry does not resist regulations itself, but struggle on certain implementation aspects. So really the answer lies not in de-regulating, but in better guidance.	Frequent interactions with all these stakeholders will help reduce cynicism and create more trust in what EPA is doing.	EPA's research lab is doing wonderful research on current environmental issues, health impacts and monitoring technologies. These take time but are long-lasting. There are some activities where the costs and time taken cannot be a measure of success. The regulations that result from this research set an example not only in the US but across the world. Inefficiencies that can be reduced are administrative and bureaucratic in nature. Why should a letter travel so many rounds before getting signed? A permit takes 2-3 weeks to do the rounds before getting signed. The reason is that we are trying to make sure there is no language for which we will be held liable. I believe the		
958	957	5/12/2017	Consider moving entire headquarters components out of the beltway to increase the application of common sense in completing our jobs, As an example, an Office of General Counsel located in "fly-over" country could do the job done by our D.C, colleagues in a much more effective and efficient way because they'd more likely focus their efforts on legal analysis than grandiose visions of how the agency ought to work.	Provide states all the flexibility under the various environmental laws to design their compliance inspection programs that is most effective for their state. There should still be a process for EPA to reach consensus with states, but one size fits all policies should end or be loosened considerably.	Make measurable customer service standards part of every SESer performance (and therefore bonus pool) evaluation.	Move HQ operations out of D.C, and into "flyover" country.

959	958	5/12/2017	In Region 5 Superfund, the community involvement section used to be part of the Community, Land and Revitalization Branch. Last Fall, Superfund reorganized (again), introduced the new Land and Revitalization Branch, and put the CI section into the newly-created Operations Management Branch. OMB handles records management, contracts, data and budget/funding (and now community involvement) for all of Superfund. It made more sense to have a CLRB where we worked closely (or could work closely) with our co-workers who handle brownfields, redevelopment, and tribal relations. There is often crossover between Superfund sites and brownfields/redevelopment projects and tribes. The CI section maintains relationships with municipalities, tribes, and community groups and can help identify possible brownfields/redevelopment projects upon completion of cleanups. The CI section can also help facilitate meetings with the community and the appropriate					See my comment in number 1.
960	959	5/12/2017	Criminal Investigation Division (CID): a major limiting factor to our CID's organizational effectiveness is the organizational structure under which CID falls. We currently report through CID management, to OCEFT, and to OECA. In this capacity, there are multiple layers of attorneys, many of whom have never been a criminal prosecutor (mostly within the civil programs), who many times block our efforts to conduct investigations. I would address this by taking the criminal program out of OECA\OCEFT and re-align it directly under the Office of the Administrator, with the Director/CID, reporting directly to the Administrator. This would allow for a more effective use of the law enforcement personnel, to address criminal violations of top concern to the Administrator, as well as provide additional resources to the Protective Service Detail (PSD). The PSD should be realigned under CID. Additionally, due to the sensitive nature of criminal investigations and the

961	960	5/12/2017	There seems to be an expectation for many of my coworkers to depend on contractors to do a portion of their work. While contractors are valuable assets to EPA operations, I believe their misuse is rampant, and much of the work can be done in-house. When a I write a document, and someone requires it to be proofed by a contractor prior to official send-out, its wast of time and money.	Allowing each region to communicate with each state/tribe in their region would be an excellent way to start. There are some very odd lines of territorial behaviors combined with a "who stole my cheese?" mentality in the regional offices. For instance, the Navajo have lands in Region 6, but Region 6 has to go through Region 9 to speak with the Navajo. So if something happens in our Region, we have to go through another to start the communication process. It really slows down everything. In what business does that type of communication process flourish? The answer is none.	Break down the barriers of stop gaps in communications due to territory or bad employees. Foster a team mentality for handling state, tribe and community outreach.	Fostering a one agency, one mission, attitude would help for a better agency. Instead of the different regional offices treating one another like foreign countries with completely opposite ideas on how to complete their mission, a top-down restructuring format for each program would aid here. Each region should have the same systems, positions and rules.	Continued reliance of automated systems instead of human-produced, paper-based ways. For instance, the agency was using sign-in sheets for Flexi-place up until a few weeks ago. That is abusive and unacceptable.	Realign agencies with similar positions that are mandated to work together on areas of combined oversight.
962	961	5/12/2017	1. Why are we required to keep paper grant files when we have so many electronic tools to store, share, access files? 2. Why do have so many shared drives? I:, G:, H:, etc. plus OneDrive and SharePoint. Too many - confusing and extra storage/resources used unnecessarily. 3. Provide snow tires for those driving in the north, in mountains. This is a winter driving safety issue. 4. Conduct a needs assessment (road conditions - off-road or paved, # passengers, etc.) to determine how many and what type of vehicles are needed (4x4 SUV or Sedan or Van) and then only acquire those vehicles - most of our driving is on pavement with 1 or 2 people. Yet we have a pickup, an SUV, and a Van. Wasteful of taxpayer $. Protect our land, water, and air - Fight climate change!	1. Rather than offer contractual services to a community or a tribe, let's give the funds to do what they need to have done. For instance, we are offering a training (by a contractor) for a very poor and needy community when they would receive a greater benefit by having some of those funds and using them in their community (employment, supplies, etc.) 2. Ask them what they want and need and then work like crazy to find out how to do it. If it's not our work, then help the community (state, tribe, industry, etc.) identify where they might get such assistance (technical, or $) Protect our land, water, and air - Fight climate change!	Ask them what they want. Listen. Be creative. Work hard, check back in. Form partnerships. Engage. Be respectful. When we leave, the stakeholders are still there - our goal should be to leave the community better than when we arrived and the community should feel a sense of ownership so that they carry on/protect/build upon/etc. what was put in place. There are often many ways to accomplish something - try to choose the manner that works best for that community. That is sustainable and good customer service. Protect our land, water, and air - Fight climate change!	Stop letting highly graded and former supervisors maintain their grade level (e.g., GS-14 or GS-15) when they are no longer supervisors. If a position is eliminated and responsibilities are reduced, then the pay should go down as well. It is hard to work really hard at a lower grade level and watch former supervisors or highly graded staff (who are no longer in their managerial or positions of responsibility) continue to draw hefty salaries with a lot less work. Unfair and a waste of tax payer dollars. Also not good for employee morale. We have 2 such instances in **[REDACTED B6]** now only supervises 3 employees, a very inefficient supervisor:staff ratio; **[REDACTED B6]**). There are	More meetings via VTC and Skype to save travel funds. However, it is still important to be able to meet in person periodically - that is the way we build relationships with our customers. Protect our land, water, and air - Fight climate change!	Form more partnerships with other federal agencies (part of the federal family) so we don't duplicate efforts and can leverage each others' resources for greater local impact. Protect our land, water, and air - Fight climate change!

963	962	5/12/2017	Keeping files in paper format costs more than just the amount for toner and paper, it costs to transfer and store records that we could scan and keep digitally. Look at the cost that the EPA is being charged to store paper records. We could cut that by 75% in a year with one or two FTEs dedicated to just scanning and properly filing the records that need to be stored for less than 10 years that have no historic need for keeping the original.				Using digital signature for signing documents and allowing employees to file records digitally would free up a lot of time and space. Also, if employees had the ability to use that technology, teleworking would be easier and given the option, more employees may opt to work from home. That could save money on building space as well as heating and cooling needs for that building.	
964	963	5/12/2017	1. Structure of HR at EPA - the structure of HR at EPA does not make any sense. The HR shared service centers are not in the Office of Human Resources; our local HR "representatives" are not technically HR officials (they do not have the authority to do classification or staffing); the SSCs do not report to one person; HR information systems are seemingly from the 1980s; HR policy is rarely updated. 2. Unions -- get rid of them. They slow down all initiatives and are a relic of a previous time. Government employees do not need union reps -- please ask congress to change this law (5 USC 71) to reduce the authority that unions have in the federal government.				1. The agency's payroll system (PeoplePlus) and personnel system (FPPS) do not function well together. This creates many issues between OCFO and OARM regarding areas of responsibility, payroll, etc. This inevitably results in a turf battle between the two organizations and the results are felt by those of us in the field. EPA must adopt one uniform system to handle payroll (including time and attendance) and personnel actions. The Dept of the Interior has this capability -- it has never been explained to us why the Agency didn't purchase this capability when we moved from PeoplePlus (for personnel actions) to FPPS. 2. Agency administrative processes such as

965	964	5/12/2017		Agriculture is big business with big pollution. Protective language both in the Farm Bill and Patriot Act make it difficult to impossible for EPA to protect human health and the environment. We already partner because that is all we can do. More lagoons and higher density animal feeding operations lay the groundwork for problems when they fail due to age or natural disaster. Recently problems in Idaho due to flooding. EPAs hands are tied and we are unable to lead the country out of the issue. It won't happen overnight but some change needs to happen. Honestly I don't see this happening under this administration and so disappointed wasn't handled under the last but what a miracle if it did. Watch "Mad Cowboy" about the cattle rancher that spoke on the Oprah show and they both got sued because of the protective language in the patriot					SRF SDWA Tribal and CWA Indian Set aside funds could feed directly into Indian Health Service (IHS) for their work prioritizing, planning, engineering and directly building or overseeing the contactors that build or refurbish drinking water and wastewater treatment plants, laying pipes, building containment/holding tanks, pump stations etc. There would need to be some sort of continued communication from the EPA tribal Drinking Water direct implementation teams in the regions with IHS and the direct implementation group seems pretty short staffed already but if the FTE overseeing the set
966	965	5/12/2017		Because EPA grants go to states and tribes, EPA's technical assistance/partnership efforts largely focus on states and tribes rather than local governments. However, because local governments have authority over land use planning and solid waste management, their policy and program actions play a very key role in achieving environmental results. This applies across the building and transportation infrastructure sectors (notably, local government programs that support low impact development methods provide a more cost-effective, common sense approach to clean water infrastructure). Also, local programs can give incentive to recover the lost value of material buried in landfills, typically worth millions in the accumulative for even medium-sized communities. When thousands of municipalities are dealing with the same root	EPA could provide more focused technical assistance to local governments to help them meet needs they identify but have limited resources to address, specifically related to environmental issues heavily linked to local land use patterns and processes under local purview. The most efficient approach to provide better customer service to local governments is one that works across typically "siloed" federal programs and has sufficient flexibility to be responsive to areas of high priority and need identified by the local government (or group of local governments working together). Note that where coordination across EPA offices and divisions is warranted to best serve local governments, this can be difficult to inspire absent high-level organizational goals and criteria that encourage both staff and managers to coordinate across air, water, land, and other human health and environmental objectives.

967	966	5/13/2017	In general the agency has allowed administrative requirements to get in the way of operations rather than require administrative procedures to support optimal operations. A few examples: People Plus system: Way too much time is required for this simple task. Why do we need to fill it out prior to end of the pay period; this almost always requires staff to go into it again and correct a prior pay period. Why not just have staff fill it out once after the pay period is over. Purchase Cards: Field staff are issued purchase cards for those infrequent times they need to purchase small items in the field. However our regional comptroller mandates that such staff will never use them resulting in needless hours and days of stressful workarounds that detracted from field operations during those infrequent needs. Note that adequate controls are in place and field purchases must still meet all the	Encourage more joint cleanup projects with the states and local government by looking at the overall threat of a hazardous waste site prior to action by any government entity. For example many situations are stabilized by local or state agencies but they lack the resources to completely address the issue and restore a site to economic or viable community re-use. However, since the local and state agencies have mitigated the risks, the site may not present a high enough remain risk to justify EPA action. However, if we would evaluate the site prior to any government action as the baseline, we would be able to leverage the state/local immediate stabilization and the EPA???s ability to complete the site.	Do a trial to re-organize me along geographic vs programmatic lines, at least as a collateral duty. This would reduce the number of points of contact to a given state or community and allow the development of personal, professional relationships. This would also improve the programmatic cross training or at least awareness of staff for professional development and reduce ???siloing??Â	The emergency response program on duty staff, who are on 24/7 duty aren???t allowed to stage the ER trucks at their standby duty location (usually residence) during standby hours. The ER Trucks must remain at either the regional office or other central location. When the duty responder is called out, instead of jumping into their truck and immediately deployed to the response site, they must commute by whatever means available overnight to get to the ER Truck. Compounding this situation in our specific region is that private vehicles are specifically excluded from the EPA garage and mass transit, which is most staff???s primary commuting method doesn???t run overnight. This policy has already	Use of drones at emergency responses and removal sites would greatly optimize and speed a response. We should undergo the effort required by the executive order to authorize such use. These could also be of much use in facility inspections, etc.	Internal: Related regulatory and response programs should be in the same division or branch so they can better work together and bring their collective authorities to bear to better serve communities. One example is our regional Emergency Planning and Community Right to Know/Risk Management Program and Emergency Response/Removal Program. Though we work together ad hoc on projects of interest if we where in the same branch or division this would be more institutionalized.
